SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 1
JANUARY 1, 1977

W77-00001 -- W77-00525
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 1
JANUARY 1, 1977

W77-00001 -- W77-00525

The Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities, Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants, Sources of Pollution; Effects of Pollution; Waste Treatment Processes, Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures, Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities, Grants, Contracts, and Research Act Allotments

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CATCHMENT MODELING AND INITIAL PARAMETER ESTIMATION FOR THE NATIONAL WEATHER SERVICE RIVER FORECAST SYSTEM,
National Weather Service, Washington, D.C. Office of Hydrology.
E. I. Peck.
NOAA Technical Memorandum NWS HYDRO-31, June 1976. 24 p, 5 fig, 6 ref, 4 append.

Descriptors: *River forecasting, *Soil moisture, *Watersheds(Basins), *Evapotranspiration, *Streamflow, Data processing, Groundwater, Percolation, *Model studies, Hydrology, Calibrations, Drainage, *Oregon, Precipitation(Atmospheric).
Identifiers: Catchment models, *South Yamhill River(OR).

The two papers in this technical memorandum were prepared for the International Symposium and Workshop on the Application of Mathematical Models in Hydrology and Water Resources Systems held in Bratislava, Czechoslovakia on 8-13 September 1975. The first 'Catchment Modeling with the United States National Weather Service River Forecast System' describes the system (NWSRFS) of conceptual hydrologic models and other procedures, used in the operational river forecasting program of the United States National Weather Service. A major revision has been made in the soil moisture accounting for the catchment model. The components for soil moisture accounting of the Sacramento Model have replaced those of the modified Stanford Model as used in the original system. The conceptual features and characteristics of the Sacramento Model are discussed. The second paper is titled: 'Calibration of National Weather Service River Forecast System: Initializing Parameters for the Catchment Model'. The use of the catchment model in the NWSRFS requires the determination of 16 model parameters. The calibration process is greatly enhanced if rational initial estimates of model parameters can be found. Techniques are developed to derive initial parameter estimates directly from the hydrometeorological data base of a catchment. Step by step demonstrations of the estimation procedure are included. LINK SLOPE DISTRIBUTION IN CHANNEL NETWORKS,
Brock Univ., St. Catherines (Ontario). Dept. of Geological Sciences.
J-J. Fling.
Water Resources Research, Vol. 12, No. 4, p 645-654, August 1976. 8 fig, 3 tab, 16 ref.

Descriptors: *Channel morphology, *Drainage systems, *Slopes, *Distribution patterns, *River basins, Gradients(Streams), Frequency curves, Data collections, Geologic control, Statistics, Histograms, Equations, Model studies, Appalachian Mountain Region.
Identifiers: *Link slope, *Appalachian Plateau, Skewed distribution, Stream order, Channel network.

The link slope distribution for given magnitude links from 18 basins in the Appalachian Plateau change from a left skewed, to a normal, to a right skewed distribution resembling a log normal distribution as the average stream gradient decreases. Variations in the link slope distribution can be partly explained by the decrease in the tendency of streams to move downward with a change in available relief or distance and by the effects of local geologic and geomorphic conditions prevailing in a basin. Downstream interior link slopes vary with magnitude following a power function. Their scatter about the log of the power function is constant in most basins. Based on these elementary properties of link slopes and the probability of occurrence of links of any one magnitude, a general model representing the distribution and expectation of interior link slopes for an entire channel network was formulated. The observed interior link slope distributions for different basins varied in shape from a monotonic decrease in frequencies with increasing stream gradient to a unimodal and sometimes bimodal distribution when exterior links were included. In spite of the large changes in the shape of the histograms for different basins, the theoretical distributions provided a good reproduction of the data. (Singh-ISWS)

2B. Precipitation

STOCHASTIC CONSIDERATIONS IN THUNDERSTORM MODELING,
Northwestern Univ., Evanston, Ill. Dept. of Civil Engineering.
R. B. Corotis.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY7, Proceedings Paper 12231, p 865-879, July 1976. 8 fig, 1 tab, 33 ref, 2 append. NSF GK-37442.

Descriptors: *Model studies, *Rainfall, *Hydraulics, *Mathematical models, Probability, Stochastic processes, Hydrology, Statistical models, Thunderstorms, Storms, Storm runoff, Meteorology.

A mesoscale stochastic model of thunderstorm activity was developed to simulate the hourly development of both air mass and squall-line storms. This modeling technique was based on Poisson occurring thunderstorms, Markov cloud formation and movement, and rainfall-producing convective cells, and was intended to provide a more complete theoretical understanding of the thunderstorm process. The rain cells formed according to a prescribed probabilistic model within clouds on an hourly basis, with a relatively high likelihood of generation of a new cell in the vicinity of a previous cell. The cells were described by a center magnitude with a Gumbel distribution and an exponential or power law decay formula. The stochastic model was programmed for simulation in a fairly general program that allows many different variables in the thunderstorm process to be either prescribed, or simulated from appropriate probability distributions. MEDIUM TERM FLUCTUATIONS OF RAINFALL IN SOUTHEASTERN ENGLAND,
University of East Anglia, Norwich (England). Climatic Research Unit.
B. M. Gray.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 433, p 627-638, July 1976. 3 fig, 9 tab, 6 ref.

Descriptors: *Model studies, *Rainfall, *Climatology, *Precipitation(Atmospheric), Monthly, Climatic data, Fluctuations, Distribution, Temporal distribution, Mathematical models, Forecasting, Meteorology.
Identifiers: *England, Power spectrum analysis.

An areal average data series based on 18 stations scattered throughout south and east England was set up. The incomplete gamma function was used as a model for the frequency distribution of the data since it gave good agreement with the parameters of the longest record in the area, Kew (1697-1971). The power spectrum of the areal average series showed that non-linear processes on a time scale of months or years may be involved in rainfall fluctuations. Decade average values of the total monthly rainfall of the area series were used to forecast decade mean monthly rainfall totals for 1970-1979, 1980-1989 and 1990-1999, using a mixed time series model. THE DESIGN OF AN INEXPENSIVE RAIN GAGE WITH BOTH AMOUNT AND RATE CAPABILITIES,
Kansas Water Resources Research Inst., Manhattan.
D. H. Lenhert, and D. R. Hummels.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 770, Price codes: A05 in paper copy, A01 in microfiche. KWRRI Contribution No. 181, August 1976. 70 p, 27 fig, 3 tab, 5 ref, 6 append. OWRT A-073-KAN(1), 14-31-0001-6017.

Descriptors: *Instrumentation, *Rain gages, *Precipitation gages, *Rainfall intensity, Data storage and retrieval, Precipitation intensity, *Design, Watershed management, Costs.
Identifiers: Battery-operated cassette recorder, Remote data logger, Digital clocks, Precipitation patterns, *Rainfall rate, Recording rainfall gage, Remote location rain gage.

Researchers doing work in the general area of water resources often have need of precipitation data. The cost of presently available recording rain gages is high, approximately $1000. A prototype recording rain gage was built for less than $200. The prototype can provide both rainfall rate and total rainfall data in a form which is computer compatible. The prototype can operate on batteries in a remote location unattended for one month. The prototype uses a plastic tipping bucket to detect each .01 inch increment of rainfall. When an increment is detected, the time in month, day, hour, minute, and second given by a digital clock is stored in an inexpensive tape cassette storage system. A microprocessor-based system is used to recover the data. The total rainfall is accurate to within 5% of an official Weather Bureau gage with a time accuracy of better than five minutes per month. A complete description of the prototype with results of field tests and recommendations for future improvements is given.
W77-00160

MEASUREMENTS OF LIQUID WATER CONTENT IN WINTER CLOUD SYSTEMS OVER THE SIERRA NEVADA,
Nevada Univ., Reno. Desert Research Inst.
D. Lamb, K. W. Nielsen, H. E. Klieforth, and J. Hallett.
Journal of Applied Meteorology, Vol. 15, No. 7, p 763-775, July 1976. 12 fig, 9 ref. Bu. Rec. 14-06-D-6632.

Descriptors: *Clouds, *Precipitation(Atmospheric), *On-site investigations, *Aircraft, *California, Storms, Sampling, Cloud physics, Measurement, Winter, Data collections, Graphical analysis, Temperature, Dew point, Meteorological data, Meteorology, Nevada.
Identifiers: *Liquid water content, *Sierra Nevada, *Lake Tahoe, Aircraft observations.

Investigations of the structure and organization of synoptic-scale storms over the Sierra Nevada Mountain Range during two successive winters (1971-73) were made with a modified B-26 aircraft. Measurements of liquid water content, temperature, and dew point were made along horizontal traverses in a vertical plane oriented roughly perpendicular to the main crest and extending from Lake Tahoe to Sacramento, California. It was shown that the spatial distribution of liquid water was linked to the gross terrain features, as was the surface distribution of precipitation. The main centers of cloud liquid water content tended to form 40-75 km upwind of the main crest in highly convective cells. (Sims-ISWS)
W77-00164

A STUDY OF SOME EFFECTS OF VERTICAL SHEAR ON THUNDERSTORMS,
Tennessee Univ. Space Inst., Tullahoma.
J. Connell.
Report NASA CR-2647, January 1976. 112 p, 28 fig, 1 tab, 42 ref. NASA NAS8-31197.

Descriptors: *Thunderstorms, *Model studies, *Shear, *Weather, Tornadoes, Air circulation, Storms, Hail, Rain, Precipitation(Atmospheric), Winds, Meteorology.

Evidence was presented for the existence of vortices and vortex pairs in thunderstorms. A preliminary parameterized model of the nonthermal generation of thunderstorm vortices derived from field observations of storms and laboratory observations of a jet in cross-flow was reported, together with an explanation of how such a model might be used to guide analysis of mesoscale rawinsonde radar, and satellite data toward an improved capability for prediction of thunderstorm motion and growth. Preliminary analyses of radar and satellite data from Atmospheric Variability Experiment IV were used with available rawinsonde data to develop a correlation between wind shears, instability, and thunderstorm motion and development. Specific studies were recommended for best development of concept and utilization of data from Atmospheric Variability and Atmospheric Variability Severe Storms Experiments. (Sims-ISWS)

PROJECT FOG DROPS V - TASK I: A NUMERICAL MODEL OF ADVECTION FOG, TASK II: RECOMMENDATIONS FOR SIMPLIFIED INDIVIDUAL ZERO-GRAVITY CLOUD PHYSICS EXPERIMENTS,
Calspan Corp., Buffalo, N. Y.
C. W. Rogers, W. J. Eadie, U. Katz, and W. C. Kocmond.
Report NASA CR-2633, December 1975. 79 p, 3 fig, 3 tab, 35 ref, 1 append. NASA NAS8-30776.

Descriptors: *Model studies, *Fog, *Oceans, *Cloud physics, Mathematical models, Droplets, Moisture, Humidity, Temperature, Cooling, Winds, Atmosphere, Computer models, Computer programs, Oceanography, Meteorology.
Identifiers: *Advective fog, *Marine fog, Fog models.

A two-dimensional, numerical model was used to investigate the formation and development of advection fog over the ocean. The model predicted the evolution of potential temperature, horizontal wind, water vapor content, and liquid water content in a vertical cross section of the atmosphere as determined by vertical turbulent transfer and horizontal advection, as well as radiative cooling and drop sedimentation in fog. The model was designed to simulate the formation, development, or dissipation of advection fog in response to transfer of heat and moisture between the atmosphere and the surface as driven by advection over horizontal discontinuities in the surface temperature. Results from numerical simulations of advection fog formation and development were discussed with reference to observational studies of marine fog. Recommendations were presented for an additional numerical modeling investigation to resolve some discrepancies between the predictions of the model and observations of advection fog formation and development over the ocean. A survey of candidate fog or cloud microphysics experiments which might be performed in the low gravity environment of a shuttle-type spacecraft was presented. Recommendations were given for experiments which were relatively simple in nature and relevant to fog modification problems. The appendix contained the model computer program. (Sims-ISWS)

THE VARIABILITY OF MONTHLY RAINFALL IN SOUTH AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Mathematical Statistics.
E. A. Cornish.
CSIRO Australia Division of Mathematical Statistics, Technical Paper No. 41, 1976. 42 p, 8 fig, 10 tab, 17 ref, 20 maps, append.

Descriptors: *Rainfall, *Frequency analysis, *Variability, *Period of growth, *Monthly, Rainfall disposition, Seasonal, *Australia, Autumn, Winter, Statistical methods, Distribution patterns, Wheat, Crop production.
Identifiers: South Australia.

A characteristic feature of autumn weather over a large proportion of the southern Australian wheat belt is that suitable conditions for seeding, germination and early growth are confined to a very limited period; the reliability of rainfall in this period is of paramount importance in providing a favourable start for the crop. The properties of the statistical distribution of monthly rainfall for all months of the year at all observing stations in South Australia have been investigated with the ultimate object of determining the probabilities of obtaining winter rainfall seasons of specifid types. Effective rainfalls are calculated according to Prescott's empirical formula, and the probability of obtaining a growing season of given duration beginning in a given autumn month is determined for each observing station. Isopleths of probability have been constructed for the various types of season. Exact fiducial limits for the probabilities are calculated. Similarly effective monthly rainfalls and their exact fiducial limits are calculated for assigned probabilities. (CSIRO)
W77-00443

2C. Snow, Ice, and Frost

ON THE FRACTURE PROPERTIES OF SNOW,
Montana State Univ., Bozeman.
R. L. Brown, and T. E. Lang.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-022 424, Price codes: A02 in paper copy, A01 in microfiche. Report No. ARO 11042.1-EN, 1975. 12 p, 5 fig, 2 tab, 8 ref. Also in: Snow Mechanics-Symposium, (Proceeding of the Grindelwald Symposium, April 1974, IAHS-AISH Publ. No. 114, 1975, p. 196-207. DA-ARO-D-31-124-73-G175, NSF GA-3943.

Descriptors: *Snow, *Energy, *Energy dissipation, *Free energy, Failure(Mechanics), Deformation, Mechanical properties, Snowpacks, Snow cover, Equations, Mathematical models, Laboratory tests, Stress.
Identifiers: *Snow fractures, Fracture properties.

The fracture characteristics of gradient metamorphosed snow were investigated and interpreted in terms of free energy and energy dissipation within the material. Utilizing continuum thermodynamics, the Helmholtz free energy was developed as a material potential and then used to calculate both free energy and energy dissipation during deformation. Values of these variables at fracture after variable deformation paths were then used to characterize a fracture criterion of snow in terms of dissipation and free energy. A constitutive equation for this type of snow was also developed and reported. (Sims-ISWS)
W77-00083

A CONCEPTUAL MODEL OF OFFSHORE PERMAFROST,
Alaska Univ., College. Geophysical Inst.
T. Osterkamp.
The Northern Engineer, Vol. 7, No. 4, p 5-10, Winter 1975-76. 8 fig, 11 ref. NOAA 40-3-158-41.

Descriptors: *Permafrost, *Erosion, *Coasts, *Alaska, Cold regions, Beaches, Freezing, Ice, Sea ice, Sea water, Temperature, Water temperature, Model studies, Waves(Water).
Identifiers: *Offshore permafrost, Sub-sea permafrost, Bonded permafrost.

The coastal erosion process was examined for the northern Alaskan coast for the purpose of developing a conceptual model of offshore permafrost. A series of as many as five stages of coastal erosion, which were characterized by different thermal and chemical boundary conditions, were necessary to describe the physical setting of the offshore permafrost. The seasonal variations of the thermal and chemical boundary conditions were discussed and it was suggested that these varying boundary conditions can be incorporated into a model of offshore permafrost consisting of the generalized transport equations from non-equilibrium thermodynamics by successively applying the transport equations to the five stages experienced by a vertical soil profile during the erosion process. EVALUATION OF TECHNIQUES FOR LONG-RANGE FORECASTING OF AIR TEMPERATURE AND ICE FORMATION,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
J. C. Rogers.
NOAA Technical Memorandum ERL GLERL-8, January 1976. 28 p, 1 fig, 6 tab, 5 ref, 6 append. Great Lakes Environmental Research Laboratory Contribution No. 60.

Descriptors: *Weather forecasting, *Air temperature, *Lake ice, *Freezing, Lakes, e, *Great Lakes, Iced lakes, Forecasting.
Identifiers: *Ice formation, *Ice forecasting, *Long-range forecasting(Ice).

Four techniques for making long-range air temperature forecasts were evaluated by using wintertime (November through February) data from around Lakes Superior, Huron, and Michigan. The purpose of the evaluation was to find a technique for forecasting air temperature which could be applied to ice forecasting on the Lakes. The four techniques analyzed were: (1) The use of cycles and oscillations: (2) The extrapolation and kinematic process used by the National Meteorological Center which results in forecasts in the Average Monthly Weather Outlook; (3) Conditional probabilities; and (4) A Markov chain equation. Based on the evaluations, it was found that only the quasi-biennial oscillation (technique 1) category forecasts and the Average Monthly Weather Outlook (technique 2) category forecasts predicted with any skill. Individually, the accuracy of the techniques is only slightly better than chance; however an improved temperature forecasting system for application to ice forecasting could be established by combining them. (NOAA)
W77-00275

LONG-RANGE FORECASTING OF MAXIMUM ICE EXTENT ON THE GREAT LAKES,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
J. C. Rogers.
NOAA Technical Memorandum ERL GLERL-7, January 1976. 19 p, 1 fig, 5 tab, 16 ref, 3 append. Great Lakes Environmental Research Laboratory Contribution No. 55.

Descriptors: *Great Lakes, *Ice, *Iced lakes, Lakes, *Forecasting, Weather forecasting.
Identifiers: Freezing degree-days, *Long-range forecasts(Ice).

A technique, based on prewinter thawing and wintertime freezing degree-days has been developed for making long-range forecasts of the percent maximum ice extent on the Great Lakes. The number of thawing degree-days is known by early winter, but the crux of the technique is to predict the number of freezing degree-days that will accumulate by March 3, the average date of maximum ice extent on the Lakes during the last 13 winters. This was accomplished by using an average March 3 accumulated freezing degree-day value from both the large and small ice extent winters between 1962-63 and 1968-69, which alternate in a quasi-biennial cycle. The equations and freezing degree-day prediction method were then used to hindcast maximum ice extent on the Lakes during the winters 1969-70 to 1974-75. The results indicated that the regression equation forecasting technique was more accurate than climatology forecasts for Lakes Superior, Michigan, and Huron. For Lake Ontario, climitology forecasts were equally accurate, and for Lake Erie, the small interannual variation in maximum ice extent made climatology forecasting the best technique. (NOAA)
W77-00276

FLEXURAL STRENGTH OF LAKE ICE IN RELATION TO ITS GROWTH STRUCTURE AND THERMAL HISTORY,
Cold Regions Research and Engineering Lab., Hanover, N.H. Snow and Ice Branch.
A. J. Gow, and D. Langston.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A020 964, Price codes: A03 in paper copy, A01 in microfiche. Research Report No. 349, December 1975. 33 p, 21 fig, 16 tab, 13 ref.

Descriptors: *Ice, *Lake ice, *Strength, *New Hampshire, Mechanical properties, Yield strength, Testing, On-site investigations, Lakes, Cantilevers, Temperature, Crystals, Stress, Deflection, Measurement, Strength of materials.
Identifiers: *Flexural strength, *Post Pond(NH), *Mascoma Lake(NH), Cantilever beam tests, Ice strength.

In-place cantilever beam tests on Post Pond and Mascoma Lake ice yielded a maximum flexural strength of 7.1 kg/sq cm. The minimum strength, unrelated to failure along pre-existing cracks in the ice, was 2.9 kg/sq cm. The majority of tests were performed in the push-down mode after it was discovered that beams tested in the pull-up mode, which placed the bottom surface in tension, frequently broke prematurely along cracks in the bottom of the ice. Premature failures of this kind usually occurred at stresses of 2-3 kg/sq cm. Data further demonstrated that the intrinsic strength of lake ice decreased significantly as the surface air temperature went to OC. Ice that had just become isothermal, but had not yet begun to candle, had a strength of about 4 kg/sq cm; ice that had been subjected to prolonged periods of above-freezing air temperatures generally failed at about 3 kg/sq cm. Tests also showed that cold, unrecrystallized snow-ice was as strong as the underlying lake ice. Tests of the effect of crystalline structure indicated that ice composed of crystals with their c-axes horizontal was measurably stronger than ice in which the crystals were oriented with their c-axes vertical. (Sims-ISWS)
W77-00354

EFFECT OF POROSITY ON THE HYDROSTATIC COMPRESSION OF ICE,
Cold Regions Research and Engineering Lab., Hanover, N.H. Snow and Ice Branch.
A. J. Gow, and W. Sheehy.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 302, Price codes: A02 in paper copy, A01 in microfiche. Special Report 234, October 1975. 12 p, 8 fig, 2 tab, 4 ref.

Descriptors: *Ice, *Antarctic Ocean, *Compressibility, *Laboratory tests, Physical properties, *Porosity, Cores, *Hydrostatic pressure, Analytical techniques, Testing, Testing procedures.
Identifiers: *Antarctic ice sheet, *Byrd Station, *Ice compressibility, Ice cores, Cathetometers.

A cathetometer was used in conjunction with a window-equipped pressure chamber to measure linear deformation in porous polycrystalline ice samples compressed hydrostatically at pressures of up to 0.31 kb. Tests showed that a porosity as little as 1% could increase the compressibility of ice four- or five-fold. However, the compression was of a substantially nonelastic nature, since very little recovery (expansion) occurred during and following pressure release. Pore closure, which was virtually complete at the higher pressures, could be attributed to a combination of plastic and cataclastic deformation of ice in the walls of the pores. (Sims-ISWS)

THE GENERATION OF RUNOFF FROM SUBARCTIC SNOWPACKS,
Washington Univ., Seattle. Dept. of Geological Sciences.
T. Dunne, A. G. Price, and S. C. Colbeck.
Water Resources Research, Vol. 12, No. 4, p 677-685, August 1976. 11 fig, 2 tab, 13 ref. CRREL, DA 4A161102B52E/02.

Descriptors: *Snowpacks, *Subarctic, *Hydrographs, *Model studies, Runoff, Generators, Snow cover, Diurnal, Waves(Water), Equations, Forecasting.
Identifiers: *Subarctic snowpacks, *Labrador, Diurnal waves, Hillside plots, Vegetative cover, Snow depth, Peak runoff.

A physically-based model of the movement of water through snowpacks was used to calculate hydrographs generated by diurnal waves of snowmelt on the tundra and in the boreal forest of subarctic Labrador. The model was tested against measured hydrographs from hillside plots that sampled a range of aspect, gradient and length, vegetative cover, and snow depth and density. The model yielded good results, particularly in the prediction of peak runoff rates, though there was a slight overestimate of the lag time. A comparison of predictions with field measurements indicated that given the ranges over which each of the controls was likely to vary, the two most critical factors controlling the hydrographs were the snow depth and the melt rate, which must be predicted precisely for short time intervals. Permeability of the snowpack was another important control, but it could be estimated closely from published values. (Roberts - ISWS)

ENERGY BALANCE COMPUTATIONS OF SNOWMELT IN A SUBARCTIC AREA,
Scarborough Coll., Toronto (Ontario) Div. of Social Sciences-Geography.
A. G. Price, and T. Dunne.
Water Resources Research, Vol. 12, No. 4, p 686-694, August 1976. 10 fig, 1 tab, 25 ref.

Descriptors: *Energy budget, *Snowmelt, *Subarctic, *Model studies, Tundra, Radiation, Turbulent flow, Equations, Runoff, Snow, Latent heat, Mathematical studies, Forecasting.

Identifiers: *Energy balance, Radiation heat flow, Boreal forest, Snowmelt plots, Radiative energy flux, Turbulent energy flux, Slope geometry, Sensible heat.

A physically based model was used to predict daily snowmelt on 2000-sq m plots in the subarctic. The plots had a range of aspects and inclinations under boreal forest and on the tundra. The energy balance, computed for each of the plots, was compensated for differences in radiative and turbulent energy fluxes caused by varied slope geometry and vegetative cover. The turbulent energy fluxes were also corrected for the effects of the stable stratification of the air over the snow surface. The predictions of the model were compared with daily melts derived from runoff measured on the snowmelt plots. The results showed that the method was a good predictor of daily amounts of snowmelt, although some uncertainties were introduced by changes in the snow surface during the melt period. In a companion paper, hourly snowmelt rates, calculated from the energy balance, were used to predict runoff hydrographs from hillside plots. (Roberts-ISWS)

R. B. Stewart, and W. R. Rouse.
Water Resources Research, Vol. 12, No. 4, p 623-628, August 1976. 9 fig, 13 ref.

Descriptors: *Evaporation, *Lakes, *Energy budget, *Radiation, Ponds, Equilibrium, Solar radiation, Air temperature, Models, Equations, On-site investigations, Mathematical studies.
Identifiers: *Shallow lakes, *Determining evaporation, *Hudson Bay lowlands, Summertime evaporation, Bowen ratio, Net radiation, Equilibrium model, Incoming solar radiation.

The summertime evaporation from a shallow lake in the Hudson Bay lowlands was evaluated by the energy budget (Bowen ratio) and equilibrium model approaches. Energy budget calculations revealed that, on the average, 55% of the daily net radiation was utilized in the evaporative process over the lake. Half-hourly and daily values of evaporation were approximated closely by the Priestly and Taylor (1972) model, where the ratio of actual-to-equilibrium evaporation equalled 1.26. A simple model, expressed in terms of incoming solar radiation and screen height air temperature, was developed from the comparison of actual-to-equilibrium evaporation. Tests of the model at a different location indicated that the actual evaporation could be determined within 10% over periods of two weeks. (Roberts-ISWS)

A NOMOGRAM TO ESTIMATE THE HEAT-EXCHANGE COEFFICIENT AT THE AIR-WATER INTERFACE AS A FUNCTION OF WIND SPEED AND TEMPERATURE; A CRITICAL SURVEY OF SOME LITERATURE,
Keuring van Electrotechnische Materialen N. V., Arnhem (Netherlands). Environmental Dept.
H. E. Sweers.
Journal of Hydrology, Vol. 30, No. 4, p 375-401, 1976. 12 fig, 6 tab, 39 ref.

Descriptors: *Heat exchangers, *Air-water-interface, Wind velocity, Water, Air temperature, Mathematical studies, Publications, Humidity, Evaporation, Energy budget, Equations.
Identifiers: *Nomograms, *Heat exchange coefficient, Wind speed, Sensible heat transfer, Evaporative heat transfer, Energy balance, Equilibrium temperature, Mass budget studies.

A nomogram was developed to relate the heat-exchange coefficient A at the air-water interface to the wind speed and to the water surface temperature. An expression for A was derived from the heat budget, giving A as a function of the so-called wind-speed function and the surface temperature. The wind-speed function was subject to frequent measurements. Part of the available literature was studied. An expression, based on the work of McMillan, was found to be applicable to conditions in temperate climates. The expression was used to construct the nomogram. (Roberts-ISWS)

WATER BALANCE OF STIPA PENNATA SPP. ERIOCAULIS, STIPA CAPILLATA AND FESTUCA VALLESIACE IN THE STEPPE REGION OF THE UPPER VINSCHAGAU, (IN GERMANY9,
F. Florineth.
Oecol Plant. 9(4), p 295-314, 1974.

Descriptors: *Grasslands, *Drought tolerance, Vegetation, *Grasses, Transpiration.
Identifiers: Festuca-Vallesiaca, *Italy, Steppes, Stipa-Capillata, Stipa-Pennata-Ssp-Eriocaulis, Vinschgau.

The water balance and drought resistance of S. pennata spp. eriocaulis Mart. et Skal., S. capillata L. and F. vallesiaca Schleich. was measured (in Italy) during the vegetation periods of 1971 and 1972 which differed greatly with respect to the climate. Characteristic for all 3 steppe grasses are their high transpiration values, even in dry periods. Reduction in water loss is only slightly effective, a high sublethal water saturation deficit or sufficient water uptake by a well developed root system, however, compensates for the water loss.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: *Morphology, Hydraulic geometry, Stable channel design, Theoretical studies.

Stream morphology has been studied by many investigators. Most of the studies have been dependent on the statistical interpretation of observed data, and very limited theoretical work has been done to explain the mechanics of the process. As an extension of the work on stable-channel design, the basic equations describing the physical response of stream morphology were employed in this study to derive the hydraulic geometry equations of a channel in coarse alluvium. Both downstream and at-a-station relations were developed. These theoretical results agreed with the field observations. It was found that the conditions of this theoretical approach are valid in watersheds with homogeneous geology but may be valid only in small watersheds with drainage areas on the order of 10 sq miles. FACTORS AFFECTING SPRING RUNOFF ON TWO FORESTED WATERSHEDS,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
M. B. Baker, Jr., and A. C. Mace, Jr.
Water Resources Bulletin, Vol. 12, No. 4, p 719-729, 7 tab, 12 ref.

Descriptors: *Runoff, *Soil water, *Minnesota, Snowmelt, Water supply, Watersheds(Basins), *Forest watersheds, Surface waters, Hydrology, Seasonal, Frost, *Recharge.
Identifiers: *Soil frost, Spring runoff, Soil water storage, Soil recharge-runoff.

The spring runoff from two forested watersheds in northern Minnesota was found to be a function of annual snowfall, soil water recharge, and water supply rates. A drainage basin with a clay soil and a hardwood overstory had greater snowmelt and water supply rates than another drainage basin with a sandy soil and conifer overstory. The average soil water recharge rate for the clay soil was 28% less than for the sandy soil. The lower recharge rate of the clay soil resulted in spring runoff which averaged 40% water supplied during the three year study while an average of 2% was produced on the sandy soil. Soil frost which affected soil water recharge varied between soil types and was influenced by amount of soil water storage and snow cover. (Lee-ISWS)

Identifiers: *Distributing channels, *Braiding channels, *New Zealand, *Namoi-Gwydir distributing system.

The individual channels of a distributary system develop floodplains that are independent of the parent streams, whereas the channels of a braided system do not develop separate floodplains. With respect to sediment load, bank cohesion, discharge, and slope, the Namoi-Gwydir distributary system does not resemble braided systems. The channel patterns of braiding and distributing are sometimes equated and related to similar fluvial processes. This paper proposed a morphological definition for distributaries that will distinguish them from braided streams. Several arguments were presented which suggest that braided and distributary channels are distinctly different with respect to causative fluvial factors. (Sims-ISWS)

MEAN ANNUAL RUNOFF IN THE UPPER OHIO RIVER BASIN, 1941-70, AND ITS HISTORIC VARIATION,
Geological Survey, Harrisburg, Pa.
R. M. Beall.
Open-file report 76-384, May 1976. 41 p, 6 fig, 4 tab, 8 ref.

Descriptors: *Streamflow, *Average flow, *Flow characteristics, *Ohio River, *River basins, Runoff, Gaging stations, Maps, Flow rates, Annual, Hydrologic data.
Identifiers: *Upper Ohio River basin, 1941-70 mean annual runoff.

A map of the Ohio River basin above the Muskingum River shows patterns of mean annual runoff for the climatologic and hydrologic reference period, 1941-70. The primary data base consisted of 98 long-term gaging-station records collected within this 27,300-square-mile headwater area of the Ohio River basin. Supplemental information was derived from 83 short-term records. Mean annual runoff is at a regional minimum of less than 12 inches in an area extending from the northern West Virginia panhandle to the headwaters of the Mahoning River in Ohio. Mean annual runoff of more than 32 inches occurs in parts of the upper Cheat River basin in West Virginia. The zone of high runoff trends northeastward along the western slopes of the Allegheny Mountains; magnitudes diminish to about 25 inches at the eastern basin boundary near Ebensburg, Pennsylvania. Runoff of this magnitude occurs also in a band across the upper Allegheny River basin in Pennsylvania. Ratios of mean annual discharge to the 30-year reference-period average were computed for each year of record for all long-term gaging stations. Annual discharges have ranged from about 30 percent to 200 percent of the 30-year mean. Graphed summaries of the annual ratios document the relative duration and magnitude of wet and dry periods during the past 65 years in the upper Ohio River basin. (Woodard-USGS)

FLOODS OF MARCH-APRIL 1973 IN SOUTHEASTERN UNITED STATES,
Geological Survey, Reston, Va.
G. W. Edelen, Jr, and J. F. Miller.
Available from Supt. of Documents, GPO, Wash., D.C., 20402, $4.50. Professional Paper 998, 1976. 283 p, 19fig, 10 tab, 11 ref.

Descriptors: *Floods, *Southeast U.S., *Flood data, *Streamflow, *Peak discharge, Rainfall-runoff relationships, Gaging stations, Flood damage, Flood recurrence interval, Reservoirs, Hydrologic data.

Floods during March-April 1973 were the greatest of record on many streams in nine major river basins in seven Southeastern States. The major thrust of the flood extended throughout the central part of the Tennessee River basin and into adjacent basins. Recurrence intervals of peak discharges exceeded 100 years at 28 streamflow gaging stations. Major flooding occurred both on streams with flood-control reservoirs and on those which had none. Substantial reductions in peak stages and discharges in the Cumberland and Tennessee River basins were attained as a result of reservoir storage regulation. Seven lives were lost and total damage reportedly exceeded $60 million. The report presents an analysis of the storm and rainfall distribution; summaries of flood stages and discharges at 490 streamflow gaging stations, stages and contents of 45 reservoirs, flood crest stages, and hydrograph data consisting of gage height, discharge, and accumulated runoff at selected times at 92 gaging stations. The availability of aerial photographs obtained during the flood is summarized and flood damages are discussed. (Woodard-USGS)

MAGNITUDE AND FREQUENCY OF FLOODS IN NORTH CAROLINA: TECHNIQUE FOR ESTIMATING THE MAGNITUDE AND FREQUENCY OF FLOODS ON NATURAL STREAMS IN NORTH CAROLINA,
Geological Survey, Raleigh, N. C.
N. M. Jackson, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254-411, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 76-17, March 1976. 26 p, 8 fig, 2 tab, 19 ref.

Descriptors: *Floods, *Flood frequency, *Frequency analysis, *Regression analysis, *North Carolina, Streams, River basins, Natural streams, Gaging stations, Regional analysis, *Streamflow forecasting, Equations, Maximum probable flood, Drainage area.
Identifiers: *Ungaged streams.

Methods are provided to estimate the magnitude and frequency of floods on natural North Carolina streams with drainage areas greater than 0.5 square mile (1.3 square kilometers). For 257 gaged sites, the magnitudes of floods having recurrence intervals from 2 to 100 years are provided in tables. For ungaged sites, equations, graphs, and maps allow estimation of flood magnitudes. Multiple regression techniques were used to define the relation between flood peaks and seven basin and climatic variables. Drainage area is the most significant variable. Inclusion of the other six variables reduced the standard error of estimate less than 4 percent. Regression equations gave consistently different results for stations in the Coastal Plain than for stations in the mountains and Piedmont. Accordingly, stations were divided into two groups and estimating equations were developed for each geographic area. (Woodard-USGS)

ONE-DIMENSIONAL SIMULATION OF AQUIFER SYSTEM COMPACTION NEAR PIXLEY, CALIFORNIA: 2. STRESS-DEPENDENT PARAMETERS,
Geological Survey, Menlo Park, Calif.
D. C. Helm.
Water Resources Research, Vol 12, No 3, p 375-391, June 1976. 12 fig, 1 tab, 22 ref.

Descriptors: *Land subsidence, *Model studies, *Aquifer systems, *California, Methodology, Aquitards, Hydraulic conductivity, Specific retention, Water storage, Compaction, Aquifer characteristics, *Simulation analysis, Computer models.

A major problem facing hydrologists is how to predict land subsidence. A key to this problem is the development of a reliable method for evaluating aquitard parameters. For assumed values of hydraulic conductivity and storage, vertical compaction and expansion of idealized aquitards can be computed (predicted) by an appropriate diffusion equation from known (projected) water level changes in adjacent aquifers. If water levels within the aquifers are observed and the resulting field compaction and expansion are measured, the parameters themselves can be evaluated. Such field measurements are available at a site near Pixley, California, for the composite behavior of a series of 21 doubly draining aquitards. By means of a linear partial differential equation with constant coefficients within one digital model, average hydraulic conductivity for idealized aquitards was evaluated from the field data to be 3000 ft/yr, and average nonrecoverable specific storage was evaluated to be 0.00023 ft. A second model allows parameters of nonrecoverable compaction to be stress sependent by assuming for any single material that the product of hydraulic conductivity and an incremental effective stress is a constant and that the product of nonrecoverable specific storage and past maximum effective stress is a constant. MODELING INFILTRATION AND REDISTRIBUTION OF SOIL WATER DURING INTERMITTENT APPLICATION,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
L. G. James, and C. L. Larson.
Transactions of the American Society of Agricultural Engineers, Vol. 19, No. 3, p 482-488, May-June 1976. 7 fig, 4 tab, 22 ref.

Descriptors: *Infiltration, *Infiltration rates, *Soil physics, *Unsaturated flow, *Soil water movement, *Unsteady flow, Soils, Porous media, Equations, Soil properties, Mathematical models, Laboratory tests, Computers.

A model that used relatively simple and reasonably accurately measured parameter equations was used to represent infiltration and redistribution of soil water during intermittent water applications. Application of the model was limited to short time periods since evapotranspiration was neglected and only impervious and air-soil interface type lower boundaries to the soil zone were considered. The soil was required to be homogeneous and to have distinct wetting fronts. Laboratory data were collected and compared with the model predictions. The model was found to predict satisfactorily the runoff quantities and timing, the volume of water stored in the soil, and the soil moisture profiles including the position of the wetting front. The model over-predicted the infiltration rate when the application rate exceeded the infiltration capacity of the soil. (Adams-ISWS)

PORE VOLUME DISTRIBUTION AND CURVE OF WATER CONTENT VERSUS SUCTION OF POROUS BODY: 2. THE BOUNDARY WETTING CURVE,
Tokyo Univ. (Japan).
M. Nakano.
Soil Science, Vol. 122, No. 2, p 100-106, August 1976. 9 fig, 1 tab, 9 ref.

Descriptors: *Porosity, *Moisture content, *Wetting, *Statistical models, Probability, Negative pore pressure, Curves, Drying, Boundaries(Surfaces), Saturation, Hysteresis, Porous media, Theoretical analysis, Surface tension, Sands, Laboratory tests, Distribution.
Identifiers: Air entrapment, Density function, O-type pore, X-type pore.

The boundary wetting curve of water content versus suction was derived by using the effective pore volume distribution which is obtained by combination of probability theory with a pore model that was proposed in a previous report (Nakano 1976). The theoretical curve was compared to experimen-

tal data with good agreement for three samples. But, when the theoretical boundary wetting curve was drawn by using the same values of parameters lambda, nu, and alpha as those applied to the boundary drying curve, a function which supplemented the relationship between suction and pore radius had to be used. This function was decided by measurement and was shown in the report. (Visocky-ISWS)

Descriptors: *Soil density, *Bulk density, *Nutrients, *Cultivation, Soil properties, Soil investigations, Soils, Soil compaction, Vegetation.

Variability of soil bulk density must be known to convert accurately concentrations of nutrients in a soil to absolute quantities. This study shows that cultivation increases the bulk density of some soils and simultaneously lowers its variability. Establishment of prairie and pine vegetation on cultivated soils has not created significant differences in this property between vegetation types in 30 years. (Skogerboe-Colo St)

TWO-DIMENSIONAL SOLUTES TRANSFER DURING NONSTEADY INFILTRATION: LABORATORY TEST OF MATHEMATICAL MODEL,
Cornell Univ. Agricultural Experiment Station, Ithaca, N.Y. Dept of Agronomy.
E. Bresler, and D. Russo.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 585-587, May-June 1975. 3 fig, 3 ref.

Descriptors: *Solutes, *Infiltration, Irrigation, Irrigation effects, Irrigation practices, Soil water movement, *Mathematical models, *Laboratory tests.
Identifiers: *Trickle irrigation, *Drip irrigation, *Solute transport.

The theory of two-dimensional transport of solutes during nonsteady infiltration from trickle sources, as developed previously, was compared with experimental results. A laboratory experiment was conducted under conditions similar to those assumed in the two-dimensional plane flow model. The agreement between theory and experiment as expressed by salt concentration distribution and location of wetting fronts, is generally good. This suggests that the theory is applicable to many situations similar to the conditions studied. (Skogerboe-Colo St)

DENITRIFICATION RATES IN RELATION TO TOTAL AND EXTRACTABLE SOIL CARBON,
Agricultural Research Service, Beltsville, Md.
G. Stanford, R. A. Vander Pol, and S. Dzienia.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 284-289, March-April 1975. 2 fig, 5 tab, 16 ref.

Descriptors: *Denitrification, *Soil investigations, *Soil chemistry, *Soil chemical properties, *Carbon.
Identifiers: *Soil carbon, Nitrate-nitrogen.

Denitrification rates were studied under near-anaerobic conditions in 30 soils of diverse origin that differed widely in pH, organic C contents, and other characteristics. Soils with added NO3-N were submerged in water and containers were sealed to prevent further oxygen intake during incubation. Disappearance of NO3-N and production of NH4-N were determined at 1-day intervals or longer over a 10-day period. Since soils were not shaken during incubation, denitrification rates were influenced by diffusion of nitrate from the liquid to the soil layer. In most soils, amounts of NO3-N declined exponentially with time of incubation. Thus, under the experimental conditions, the loss of nitrate was depicted better by log NO3-N vs. time (t, hours) than ppm NO3-N vs. t. (Skogerboe-Colo St)

Descriptors: *Sodium, *Soil investigations, *Soil chemistry, *Soil chemical properties, Soil management, *Iowa.
Identifiers: Exchangeable sodium, *Ryegrass.

Ryegrass was grown in the greenhouse on undried soil samples from the 0 to 15 and 30 to 45 cm depths of 15 Iowa soils. The NH40Ac exchangeable Na was 21 ppm or less in all soil samples except those from the 30 to 45 cm depth in southern Iowa soils, which contained 28 to 115 ppm exchangeable Na. The pH of these southern Iowa subsurface samples varied from 5.1 to 6.0. Percentages of Na in the first harvest of ryegrass were directly related to the exchangeable Na contents of the soils and inversely related to exchangeable soil K and K content of the plants. TOTAL NITROGEN USING A SODIUM HYDROXIDE INDEX AND DOUBLE SAMPLING THEORY,
Forest Service (USDA), La Grande, Oreg. Pacific Northwest Forest and Range Experiment Station.
J. M. Geist, and J. W. Hazard.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 340-343,March-April 1975. 1 fig, 1 tab, 4 ref.

Descriptors: *Nitrogen, *Regression analysis, Soil chemistry, Soil properties, Soil investigations, Soil tests.
Identifiers: *Sodium hydroxide index, *Double sampling theory.

A regression relationship was investigated between total Kjeldahl soil N and an NaOH distil-

lable fraction of soil N. The correlation coefficient r was 0.989 for 45 soil samples. A double sampling approach using both analyses to estimate total N was more efficient than Kjeldahl analyses only. Example applications are presented under cost and precision limitations. The regression can also be used to obtain point values of total N for mapping or other nonstatistical purposes. (Skogerboe-Colo St)

A NEW TECHNIQUE FOR RAPID AND CONTINUOUS MEASUREMENT OF REDOX POTENTIALS,
Lockheed Missiles and Space Co., Sunnyvale, Calif.
R. S. Linebarger, F. D. Whisler, and J. C. Lance.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 375-377, March-April, 1975. 2 fig, 2 ref.

Descriptors: *Laboratory tests, *Electrodes, Soil tests, Sewage, Sewage disposal, *Oxidation reduction potential, Measurement, Analytical techniques.
Identifiers: Soil columns.

A new 'salt bridge' technique for the rapid and continuous measurement of redox potentials at various depths in multiple soil columns, utilizing only one calomel electrode, is described. The method was compared with a previous technique where a reference electrode was placed in each of 8 soil columns, containing a total of 42 platinum redox probes. A least-squares best fit statistical analysis indicated that the new technique yields redox potential measurements accurate as those of the previous method. Several other features of the salt bridge technique make it advantageous for use both in the laboratory and in the field. (Skogerboe-Colo St)

USE OF AMMONIA ELECTRODE FOR DETERMINATION OF CATION EXCHANGE CAPACITY IN SOIL STUDIES,
Iowa State Univ., Ames. Dept. of Soil Science.
G. A. Miller, F. F. Riecken, and N. F. Walter.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 372-373, March-April 1975. 1 fig, 7 ref.

Descriptors: *Cation exchange, Soil tests, Soil properties, Soil investigations, Laboratory tests, Electrodes, Analytical techniques, *Soil profiles, Ion exchange.
Identifiers: Ammonia electrode.

Cation exchange capacity (CEC) was determined with an ammonia electrode on 37 horizon samples from four soil profiles. The profiles selected to test this procedure had a wide range of physical and chemical properties. The procedure was a modification of other techniques. Centrifugation was employed for removal of exchangeable cations and ammonium salts. The CEC values obtained with the ammonia electrode agreed closely with values obtained by direct distillation for adsorbed ammonia. The method was simple and rapid and suitable for soil studies. Using the proposed method a single operator could carry out the analysis of 16 or more samples in a normal working day. (Skogerboe-Colo St)

GRAPHICAL REPRESENTATION OF TRICATIONIC EXCHANGES WHERE ONE OF THE CATIONS IS THE PROTON,
Centre de Recherches Agronomiques de Provence, Antibes (France). Station d'Agronomie et de Physiologie Vegetale.
J. P. Andre.
Journal of Soil Science, Vol. 26, No. 1, p 81-92, March 1975. 5 fig, 16 equ, 1 ref.

Descriptors: *Model studies, *Cation exchange, Soils, Soil investigations, Adsorption, Agronomy, Physiology.
Identifiers: Protons(Cation exchange).

Most constituents of the adsorbing complex of the soil are cationic exchangers with variable exchange capacity: it is possible to study graphically exchanges involving the protons and two other cations. The representation developed here uses and generalizes the principle of the bicationic exchange isotherms in a square diagram. This helps to explain some experimental phenomena and enables the final equilibria of the exchange reactions to be forecast. The model seems useful for application in agronomy and physiology. (Skogerboe-Colo St)

EFFECT OF PLOUGHING AND DIRECT DRILLING ON SOIL NITRATE CONTENT,
Agricultural Research Council, Wantage (England). Letcombe Lab.
R. J. Dowdell, and R. Q. Cannell.
Journal of Soil Science, Vol. 26, No. 1, p 53-61, March 1975. 2 fig, 2 tab, 26 ref.

Descriptors: *Nitrates, *Cultivation, Soils, Soil investigations, Water quality, Clays.
Identifiers: *Soil nitrates, *Cultivation practices, *Direct drilling(Crops), *Nitrate-nitrogen.

The concentration of nitrate-N at 30 cm depth in a clay soil was 2-5 times greater after ploughing than after direct drilling during the winter and spring of 1972-73. However, by early May no significant differences could be detected between cultivation treatments. It is concluded that decreased mineralization of soil nitrogen in the direct-drilled soil is the main factor responsible for the differences observed. (Skogerboe-Colo St)

SHORT TERM NITRATE LOSSES AND ASSOCIATED MICROBIAL POPULATIONS IN SOIL COLUMNS,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
H. E. Doner, M. G. Volz, L. W. Belser, and Jan-Per Loken.
Soil Biology and Biochemistry, Vol. 7, No. 4/5, p 261-263, July 1975. 1 fig, 15 ref.

Descriptors: *Nitrates, *Leaching, Soil investigations, Soils, Soil tests, Return flow, Irrigation, Microbiology, Nitrogen.
Identifiers: *Soil columns, *Microbial populations(Soils).

The relationship between N03 loss from solution and associated microbial populations as a function of time and depth in soil was studied. Soil columns were leached with a N03 solution under flooded conditions. Soil columns were cut into top, middle and bottom sections following 4.5, 12, 24, 48 and 120 h of leaching. Soil was subsequently analyzed for N03 and N02 content and microbial counts were made for denitrifiers, nitrate reducers and total microbial population. Nitrate losses were found to be directly related to an increase in the denitrifier population and proportional to the residence time of solution in the soil. The total microbial population and nitrate reducer population remained nearly constant throughout the experiment. (Skogerboe-Colo SU)

RELATIONSHIPS BETWEEN THE DENITRIFICATION CAPACITIES OF SOILS AND TOTAL, WATER-SOLUBLE AND READILY DECOMPOSABLE SOIL ORGANIC MATTER,
Iowa State Univ., Ames. Dept. of Agronomy.
J. R. Burford, and J. M. Bremner.
Soil Biology and Biochemistry, Vol. 7, No. 6, p 389-394, November 1975. 5 fig, 3 tab, 13 ref.

Descriptors: Organic matter, *Denitrification, Soils, Soil investigation, Soil chemistry, *Nitrogen, Anaerobic conditions, *Decomposing organic matter, Carbon.
Identifiers: Organic carbon.

The relationships between the denitrification capacities of 17 surface soils and the amounts of total organic carbon, mineralizable carbon, and water-soluble organic carbon in these soils were investigated. The soils differed markedly in pH, texture, and organic-matter content. Denitrification capacity was assessed by determining the N evolved as N2 and N20 on anaerobic incubation of nitrate-treated soil at 20 degrees C for 7 days, and mineralizable carbon was assessed by determining the C evolved as C02 on aerobic incubation of soil at 20 degrees C for 7 days. The denitrification capacities of the soils studied were significantly correlated with total organic carbon and very highly correlated with water-soluble organic carbon or mineralizable carbon. The amount of nitrate N lost on anaerobic incubation of nitrate-treated soils for 7 days was very closely related to the amount of N evolved as N2 and N20. (Skogerboe-Colo St)

THE EFFECT OF BULK DENSITY ON NEUTRON METER CALIBRATION,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond, (Australia). Div. of Soils.
E. L. Greacen, and G. Schrale.
Australian Journal of Soil Research, Vol 14, No 2, p 159-169, June 1976. 2 fig, 4 tab, 10 ref.

Descriptors: *Nuclear moisture meters, *Calibrations, *Soil density, Soil moisture, Moisture content, Instrumentation, Measurement, Neutron absorption, Soil physical properties.

In the use of neutron moisture meters sufficient account is not always taken of the need for careful calibration, particularly with respect to variations in soil dry bulk density. Experimental and theoretical methods have been proposed for obtaining correction factors but for various reasons they are not satisfactory. Olgaards method based on three group diffusion theory gives acceptable accuracy for soils with small absorption cross-section, but for soils with high absorption cross-section, common in Australia, this model fails to predict the slope of the calibration line. A simpler alternative procedure is proposed, based on the assumption that count rate at constant total water content is proportional to the square root of bulk density. (CSIRO)

HYDRAULIC CONDUCTIVITY IN SURFACE ACTIVE SOILS,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Civil Engineering.
P. Basak, and M. R. Madhav.
Australian Journal of Soil Research, Vol. 14, No. 2, p 121-127, June 1976. 4 fig., 16 ref.

Descriptors: *Clays, *Hydraulic conductivity, *Pore water, *Water structure, *Viscosity, *Bound water, Capillary water, Capillary flow, Soil water movement, Soil physical properties, Equations, Mathematical studies.

Kozeny's equation based on a capillary tube model with constant viscosity does not give satisfactory results for fine-grained soils. When surface forces dominate over gravity forces, the pore water behaves abnormally and the physical properties of this pore water are found to be quite different from free water. Flow through saturated fine-grained soils is known to be affected by the properties and thickness of loosely and strongly bound water, whose viscosity is observed to be higher because of the modified water structure induced by clay-water interaction. An analytical solution based on a capillary-tube model taking into account the changed viscosity of bound water and variation of viscosity within the bound water in relation to its thickness is attempted. The derived equation appears to be general in nature and is applicable for both surface active and inactive soils. It is shown that Kozeny's equation turns out to be a particular case of the derived equation when the thickness of the bound water is zero or when the variation of viscosity is not taken into account. THE EFFECT OF SOIL PROPERTIES ON ZINC ADSORPTION BY SOILS,
Georgia Univ., Experiment. Dept. of Agronomy.
L. M. Shuman.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 454-458 May-June, 1975. 4 fig, 2 tab, 18 ref.

Descriptors: *Zinc, *Organic matter, *Clays, Soils, *Soil investigations, *Sands, Soil chemistry, Soil texture, *Adsorption, Georgia, Hydrogen ion concentration, Organic matter, Isotherms, Cation exchange, Path of pollutants.
Identifiers: Langmuir isotherm, *Cation exchange capacity.

Solutions containing eight different concentrations of Zn were equilibrated with four soils sampled at two depths to determine whether Zn adsorption conformed to the Langmuir isotherm and to relate the Langmuir coefficients to soil properties. Zinc adsorption conformed to the Langmuir isotherm and two linear portions of the curve were found. The adsorption sites for the lower part had very high bonding energy coefficients and low adsorptive capacities compared with the adsorption sites of the part of the curve corresponding to higher Zn concentrations in the equilibrating solution. The cation exchange capacity (CEC) was related to the adsorptive capacity. The lower part was equivalent to 23% of the CEC and the upper part to 76% of the CEC. Soils high in clay or organic matter had higher adsorptive capacities and higher bonding energies for Zn than sandy soils low in organic matter. More differences in Zn adsorption were observed among soil types than between depths in each soil type. A study of the effect of pH on the adsorption of Zn revealed that low pH reduced Zn adsorption more for the sandy soils than for those high in colloidal-size materials. (Skogerboe-Colo St)

Identifiers: *Desorption, *Minerals, Benzoate ions, Salicylate ions, Phthalate ions, *Chile, *Typic Dystrandept soils, *Volcanic-ash soils.

The adsorption, desorption, and competitive adsorption characteristics of benzoate, p-OH benzoate, salicylate, and phthalate were used as models to study the possible mechanisms involved in the interactions of organic compounds with amorphous materials. The studies were carried out in batch systems using subsoil samples of three Typic Dystrandept soils from Chile. (See also W77-00474) (Skogerboe-Colo St)
W77-00473

INTERACTIONS BETWEEN ORGANIC COMPOUNDS, MINERALS, AND IONS IN VOLCANIC-ASH-DERIVED SOILS: II. EFFECTS OF ORGANIC COMPOUNDS ON THE ADSORPTION OF PHOSPHATE,
California Univ., Riverside. Dept. of Soil Science.
H. Appelt, N. T. Coleman, and P. F. Pratt.

Soil Science Society of America Proceedings, Vol. 39, No 4, p 628-630, July-August 1975. 5 tab, 16 ref.

Descriptors: *Organic compounds, *Ions, *Adsorption, *Phosphates, Soils, *Soil investigations, Path of pollutants, South America, Anions, Soil analysis.
Identifiers: *Minerals, *Chile, *Typic Dystrandept soils, *Volcanic-ash soils.

The effects of organic compounds on phosphate adsorption by volcanic-ash-derived soils were studied using benzoate, p-OH benzoate, salicylate, and phthalate, and by humic and fulvic acids extracted from a surface soil sample of a Typic Dystrandept. The adsorption of simple organic anions that are specifically adsorbed block to some extent the adsorption sites for nonspecifically adsorbed anions such as chloride and/or nitrate. But, organic anions did not compete for or block adsorption sites for phosphate anions, because of the much higher affinity of phosphates for the adsorption sites in these volcanic-ash-derived soils. VARIATIONS IN PICLORAM LEACHING PATTERNS FOR SEVERAL SOILS,
Washington State Univ., Pullman. Dept. of Agronomy and Soils.
C. L. Ping, H. H. Cheng, and B. L. McNeal.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 470-473, May-June 1975. 3 fig, 2 tab, 9 ref.

Descriptors: *Leaching, Soils, *Soil investigations, *Soil texture, Pesticides, *Diffusion, *Saturated soils, Diffusivity, Porosity, *Hawaii, Electron microscopy, Path of pollutants.
Identifiers: *Picloram, Volcanic soils(Hawaii).

Laboratory studies of picloram leaching under saturated conditions were conducted for four soils. Leaching patterns could be related to variations in soil texture and pore uniformity for three soils from arid and semiarid regions. Diffusion from conducting pores into adjacent micropores appeared to be the most plausible explanation of leaching patterns obtained for an Oxisol of volcanic origin from Hawaii. Evidence supporting the presence of the postulated micropore structure in this tropical soil was obtained from constancy in flow rate, from scanning electron micrographs, and from picloram recovery at a reduced leaching rate. THE MINERAL CONTENT IN SOIL AND SUBSOIL WATER CLOSE TO THE SURFACE BELOW CONIFEROUS AND ARABLE LAND IN SANDY SOIL OF NORTHWEST GERMANY, (IN GERMAN),
Landwirtschaftskammer Weser-Ems, Oldenburg (West Germany).
P. Foerster.
Forstwiss Centralbl. 94(2/3), p 67-78, 1975.

Descriptors: *Sampling, *Subsurface waters, *Soil water, Land, Arable land, Coniferous forests, *Mineral water, Mineralogy, Chlorine, Nitrogen, Phosphorus, Sulfur, Hydrogen ion concentation.
Identifiers: *Mineral content, *West Germany.

Samples of water were extracted during Feb. 1973-Jan. 1974, and tested for N03-N, NH4-N, N02-N, total P, S04-S, C1 and pH. From the depths (30-60 cm, 60-90 cm, 110-140 cm, 150-180 cm below the surface) the water was obtained by the Czeratzki suction apparatus. The subsoil water from the lowest depths (180-210 cm below the surface) was extracted by upright tubes. The N03-N content in soil and subsoil water below woodland was very little in comparison with fertilized arable land. Accordingly, the exudates of N03-N below woodland were approximately 10 times less in comparison with those of arable land. The NH4-N, N02--N and P content in soil water and subsoil water close to the surface below woodland and arable land was approximately the same. Below woodland the S04-S content in soil water was greater than that in arable land, whereas in subsoil water the S04-S content was the same. The C1 content of subsoil water close to the surface below arable land was twice as much as that below woodland.--Copyright 1976, Biological Abstracts, Inc.

Biol Nauki. 17(12), p 106-112, 1974.

Descriptors: Soils, Clays, Swamps, *Forest soils, Drainage systems, Agricultural engineering.
Identifiers: *Ferruginous solonchak, Jurassic clays, *Rudyak soils, *Solonchaks, *Taiga, *USSR.

Problems of the origin and use of rudyak soils (ferruginous solonchaks of the taiga zone) are discussed. These soils are formed in areas swamped by highly ferruginous groundwaters. Ferruginization of the waters and soils is due to the geologic structure of the territory, particularly the relatively close occurrence of Jurassic clays. Ways of evaluating the expediency of constructing drainage systems and agricultural development of swamped soils with rudyak horizons are given.--Copyright 1975, Biological Abstracts, Inc.

THE CHANGE OF CLAY MATERIAL IN CHERNOZEMS UNDER RICE CULTIVATION, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Science.
G. M. Mainasheva, N. P. Chizhikova, and S. A. Nikolaeva.
Vestn Mosk Univ Ser 6 Biol Pochvoved. 29(6), p 74-80, 1974.

Descriptors: *Clays, *Rice, *Aquatic soils, Drowned(Submerged), *Submergence, Flooding, *Oxidation-reduction potential, *Soil chemical properties, Chemical properties, *Chernozems, Oxidation-reduction potential.
Identifiers: Montmorillonite, Shamozite, USSR.

The influence of periodic inundation under a rice crop was studied in the southern chernozems of Odessa oblast (Ukrainian SSR, USSR). The dynamics of several elements and the change in the chemico-mineralogical composition of the clay material were determined in the field cultivated with rice for 4 yr. Due to inundation the upper horizons lost their < 0.001 mm particles and their montmorillonite component. There is a possibility of the formation of the shamozite type of mineral with an imperfect structure due to the change in redox potentials of the soil.--Copyright 1975, Biological Abstracts, Inc.

MECHANISM OF INTERACTION OF WEAKLY MINERALIZED IRRIGATION WATER WITH SOIL, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Science.
B. G. Rozanov, and M. A. Abdel'-Mottalib.
Biol Nauki. 18(2), p 127-130, 1975.

Descriptors: *Irrigation effects, *Soils, *Soil chemical properties, *Surface-groundwater relationships, Sodium, Potassium, Calcium, Magnesium, Mineral water.

When the irrigation and ground waters interact with the soil their composition changes considerably; the change in the composition of Na and K salts was a result of evaporation of the water, and that of Ca and Mg salts was a result of the interaction with the solid phase of the soils.--Copyright 1975, Biological Abstracts, Inc.

ROLE OF EDDY DIFFUSIVITY IN THERMOCLINE FORMATION,
Leicester Univ. (England). Dept. of Engineering.
B. Henderson-Sellers.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE3, Proceedings Paper 12174, p 517-531, June 1976. 8 fig, 3 tab, 19 ref, 2 append.

Descriptors: *Eddies, *Model studies, *Environmental engineering, *Diffusion, Heat transfer, Hydrodynamics, Mixing, Reservoirs, Stratification, Temperature, *Thermocline, Lakes, Turbulence, Water quality, Stratified flow, Stability, Equations.
Identifiers: *Eddy diffusivity, Stratified lake, Thermocline structure, Neutral eddy diffusion.

Several functional forms for the eddy diffusivity in a lake or reservoir were analyzed for incorporation into a one-dimensional model for the vertical temperature structure of the water body. A suitable form for the neutral eddy diffusivity was found, and this was used in solution of the heat transfer equation to simulate thermocline formation and seasonal development. (Lee-ISWS)

PRESENT STATE OF ZOOPLANKTON AND ZOOBENTHOS OF LAKE ADZHIKABUL, (IN RUSSIAN),
A. G. Kasymov, F. G. Badavov, and A. R. Aliev.
Izv Akad Nauk Az Ssr Ser Biol Nauk 2, p 107-110, 1975.

Descriptors: Zooplankton, Benthos, Copepoda, Salinity, Regime, Oxygen, Lakes, Rotifers.
Identifiers: *Lake Adhikabul(USSR), Azerbaijan-Ssr, USSR.

Lake Adzhikabul (area 860 ha, length 6 km, width 3 km, depth 5 m) is located on the left bank of the Kura River in the Azerbaijan SSR (USSR). After construction of the Mingechaur hydroelectric station the lake ceased to obtain water from the Kura and began to dry up and become salty. Formerly there were 45 spp. of zooplankton, now there are 6 spp. of rotifers and 2 spp. of copepods, all salt-loving or resistant to increased salinity. The number of species of benthos has decreased from 44 to 10 in connection with the deterioration of the O2 regime and salinization of the water. Measures for improving the abiotic and biotic environment of the lake are recommended.--Copyright 1976, Biological Abstracts, Inc.

PILOT INVESTIGATION OF THE IMPORTANCE OF VARIOUS WETLAND TYPES TO DUCK PRODUCTION,
South Dakota State Univ., Brookings. Dept. of Wildlife and Fisheries.
J. M. Gates, and L. D. Flake.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 780, Price codees: A03 in paper copy, A01 in microfiche. Completion Report, July 1976. 32 p, 1 fig, 22 ref. OWRT A-038-SDAK(1). 14-31-0001-4042

Descriptors: *Wetlands, *Waterfowl, Reproduction, *Ducks, Water resources development, Wildlife conservation, Balance of nature, Habitat improvement, *South Dakota, Mallard ducks, Gadwall ducks, Blue-winged teal, Pintail duck.
Identifiers: Waterfowl production.

Wetland characteristics, adjacent upland conditions, and corresponding populations of breeding waterfowl broods were surveyed on 500 quarter sections in 125 clusters proportionally stratified within eight physiographic strata in South Dakota. The estimated total of breeding pairs was 1,067,500 in 1973 and 439,600 in 1974. Drought conditions occurred concurrent with the reduced 1974 populations. Blue-winged teal (Anas discors) was the major species followed by mallard (Anas platyrhynchos), pintail (Anas acuta), and gadwall (Anas strepera). Less than five percent of the total breeding pairs was composed of diving ducks (Aythyini). Striking differences in densities of breeding pairs occurred between the major physiographic regions of the state. Waterfowl densities were highest in the glaciated eastern half of South Dakota, particularly in the northern periphery of the Coteau des Prairies and the major portion of the Coteau du Missouri. The non-glaciated western half of the state had relatively low waterfowl densities but contributed 21.6 percent in 1973 and 32.3 percent in 1974 of the total breeding pairs. Class III and IV ponds and stockdams were used by a large segment of most waterfowl populations throughout the study. Stockdams were used by a larger segment of all populations in 1974 than in 1973, while the proportion of ducks using natural ponds and lakes decreased from 1973 and 1974. Dugouts closely associated with other wetlands had higher waterfowl use than those not associated with other wetlands. (Wiersma-South Dakota)

LITTORAL ZOOPLANKTON OF THE BAIKAL OPEN ZONE, (IN RUSSIAN),
Limnologicheskii Institut, Irkutsk (USSR).
E. L. Afanas'Eva.
Gidrobiol Zh 11(3), p 26-31, 1975.

Descriptors: *Zooplankton, *Littoral, Lakes, Crustaceans, Rotifers.
Identifiers: Cyclopidae, *Epischura, USSR, *Lake Baikal(USSR).

Zooplankton of the Baikal (USSR) littoral zone, a narrow shelf area without large inflows and bays is under the constant influence of the waters of the open zone of the lake. A dominating form here is the Baikal endemic Epischura. Periods of appearance and development of Cyclopidae, Cladocera and lake rotifers coincide with those in the open zone, with a predominance of these forms in the littoral. Sharp changes in zooplankter number are observed at constant stations with daily sampling, caused by a spotty distribution of zooplankton and the dynamics of water masses in this region.--Copyright 1976, Biological Abstracts, Inc.

APPENDIX 4, LIMNOLOGY OF LAKES AND EMBAYMENTS, GREAT LAKES BASIN FRAMEWORK STUDY.
Great Lakes Basin Commission, Ann Arbor, Mich. Public Information Office.
1976. 441 p, 301 fig, 95 tab, 923 ref.

Descriptors: *Great Lakes Region, *Lake Erie, *Lake Huron, *Lake Michigan, *Lake Ontario, *Lake Superior, *Geomorphology, Physical properties, *Limnology, *Climatology, Hydrology, Chemical properties, Biological properties, *Sedimentology, Water utilization, Great Lakes, Lakes, *Bays, Precipitation(Atmospheric), Evaporation, Water levels, Water temperature, Radiation, Water level fluctuations, Ice cover, Iced lakes, Currents(Water), Density currents, Water circulation, Trace elements, Bacteria, Coliforms, Data collections, Bottom sediments, Sediment distribution, Ice, Meteorology.
Identifiers: Upland lakes.

This appendix presented the processes that underlie the hydrology, hydrodynamics, biology, and chemistry of the Great Lakes, harbors, embayments, and upland lakes in the Great Lakes Basin; also, current knowledge of the limnological processes was synthesized. The appendix also aids the development of a comprehensive plan for optimum utilization of water and related land areas by doing the following: (1) synthesizing the limnological data applicable to regional planning considerations; (2) describing the limnological processes of the Great Lakes and of the upland lakes of the Great Lakes Basin in such a fashion that they may be logically interrelated; (3) identifying those regions in which insufficient data exist for water resource planning and defining the data deficiencies; (4) identifying those physical, chemical, and biological processes that are inadequately understood and require further study; (5) defining those Great Lakes water resource problems that exist or that may arise by the year 2020; and (6) serving as a basic data source use and management appendixes. The data used in this report were obtained from material either in print or readily accessible from local, State, and Federal agencies. (See also W76-03862 through W76-03870) (Humphreys-ISWS)

POSSIBILITIES OF DETERMINING COMMUNITY BOUNDARIES WITHIN THE LIMITS OF A LAKE ECOSYSTEM, (IN RUSSIAN),
Nature Conservation, Game Preserves and Hunting, Moscow (USSR). Central Lab.
N. V. Vehov.
Zh Obshch Biol 36(3), p 382-388, 1975.

Descriptors: Lakes, *Ecosystems, *Zooplankton, *Littoral, Depth, Biomass, *Biological communities.
Identifiers: *Pelagial depth, *Lake Yanei-Ty(USSR).

The zooplankton of Lake Yanei-Ty (Bolshezemskaya Tundra) (USSR) were used to study the possibility of establishing the spatial limits of the littoral (depths to 1.5 m) and pelagial (depths to 4-6.5 m) zooplankton communities. The species composition of zooplankton was similar in both biotopes, but the species exhibited population density peaks at different times in the littoral and pelagial, their population density also being different. The highest abundance and maximum biomass were observed in different periods; the ratios of the principal taxa and trophic groups in the plankton were different in the course of the observation periods changes in the ratio of these groups occur within the limits of each biotope. The species diversity and biomass was characteristic in the littoral, but it was positive for the pelagial. Such regularities were not detected for all the points throughout the lake when estimating the correlations. This lake contains 2 different plankton communities inhabiting different natural areas of the lake and having many discriminating features, though their species composition may be identical.—Copyright 1976, Biological Abstracts, Inc.

Identifiers: *Akstafa Reservoir, Asplanchna-Priodonta, Azerbaijan SSR, Bosmina-Longirostris, Brachionus-Rubens, Cyclops-Strenuus, Daphnia-Longispina, Dunhevedi-Crassa, Eucyclops-Serrulatus, Lecane-Bulla, Moina-Rectirostris, *USSR.

An investigation of water samples taken from the Akstafa reservoir (area 630 ha), constructed in 1969 on the Akstafachai River near the city of Kazkh in the Azerbaijan SSR (USSR), revealed 24 spp. of zooplankton (9 spp. of Rotatoria, 11 Cladocera and 4 Copepoda), of which only 3, Daphnia longispina, Eucyclops serrulatus and Cyclops strenuus, were dominant species and another 6 subdominant, Brachionus rubens, Asplanchna priodonta, Lecane bulla, Moina rectirostris, Dunhevedi crassa, Bosmina longirostris. Data are given on the seasonal change of the numbers and biomass of these 9 species. The species composition, number and biomass of zooplankton of the Akstafa reservoir are compared with other reservoirs of the Azerbaijan SSR.—Copyright 1976, Biological Abstracts, Inc.

B. V. Timms.
Australian Journal of Marine and Freshwater Research, Vol 27, No 1, p 35 - 60, March 1976. 16 fig, 8 tab, 40 ref.

Descriptors: *Saline lakes, Aquatic environment, Limnology, *Australia, Lakes, Craters, *Salinity, Water temperature, Dissolved oxygen, Light penetration, Stratification, Lake sediments, Hydrogen ion concentration, Seasonal, Organic matter, Oxygenation, Oxidation-reduction potential.
Identifiers: Lake Purrumbete(Vic.), Lake Bullenmeri(Vic.), Lake Gnotuk(Vic.), *Maar lakes(Australia).

Three typical maar lakes in western Victoria were selected for study because although of similar size, altitude and (volcanic) origin, they vary in salinity from fresh to markedly saline, providing an unusually favourable opportunity for investigating the effect of salinity on the ecology of athalassic lakes. The major physiographic and physicochemical features of the lakes are described, with emphasis on variation, between lakes and seasonally. Factors discussed include salinity, pH, oxygenation, temperature, transparency, stratification, and the nature, organic matter content and redox potentials of the sediment. (CSIRO)

CHEMICAL COMPOSITION AND FOOD VALUE OF SOME MEMBERS OF FRESHWATER ZOOPLANKTON IN PONDS OF THE SOUTHERN MOLDAVIAN SSR, (IN RUSSIAN),
V. I. Ashevskii.
Izv Akad Nauk Mold SSR Ser Biol Khim Nauk. 6, p 49-53, 1974.

Descriptors: *Zooplankton, *Chemical properties, Crustaceans, Copepods, Phytoplankton, *Mineral water, Ponds.
Identifiers: Acanthocyclops-Cernalis, Bosmina-Longirostris, Cladocera, Cyclops-Vicinus, Daphnia-Magna, Diaptomus-Coeruleus, Keratella-Quadrata, Moina-Micrura, Moldavian-SSR, Rotatoria, USSR, Food value.

The dependence of the chemical composition of some members of freshwater zooplankton (Rotatoria: Keratella quadrata; Cladocera: Daphnia magna, Moina micrura, Bosmina longirostris; Copepoda: Cyclops vicinus, Acanthocyclops vernalis, Diaptomus coeruleus) on the composition and quantity of phytoplankton and degree of mineralization of water in some ponds in the southern Moldavian SSR (USSR) is discussed. The content of mineral substances in members of Cladocera and Copepoda depends not only on the degree of mineralization of the water but also on the quantitative relationship of the alcium carbonate equilibrium in it. In a food respect (total content of fat, protein and organic matter) the investigated members of Copepoda are distinguished by a greater calorific value than the investigated members of Cladocera, except for B. longirostris having a maximum calorific value (6.78%). The chemical composition of the investigated crustaceans is subject to considerable variation depending on the ecological and trophic conditions of the ponds.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Lakes, Fish, *Fish reproduction, *Environmental effects, Ecology.
Identifiers: Coregonus-lavaretus-nelmuschka, Nelmuschka, Russian-SFSR, USSR, *Whitefish, *Beluga.

The results of an investigation of the dwarf lake-river whitefish, nelmuschka (C. lavaretus nelmushckr) in Lake Kubenskoye in the Vologda Oblast of the Russian SFSR (USSR) are presented. The Kubenskoye nelmuschka is characterized by a decrease in absolute fecundity and increase of relative fecundity and of species fecundity in comparison with other forms of this species. The fecundity of the nelmuschka depends not only on body weight but on environmental conditions. The dwarf growth and fecundity characteristics are evidence that the Kubenskoe nelmuschka exists at the extreme limits of its ecological amplitude. Any deterioration of the habitat of this whitefish will cause its death.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: Bythotrephes-longimanus, Charkhal smelts, Clupeonella-delicatula-caspia-tschar, Kilka, Kuibyshev reservoir, Leptodora-kindtii, Russian-SFSR, USSR.

An analysis was made of the food spectrum of underyearling and yearling Charkhal kilka (Clupeonella delicatula caspic m. tscharchalensis) and its seasonal and local variations in the e Kuibyshev Reservoirs (Russian SFSR, USSR.) on the Volga. Indices of selection of food objects of the 2 age groups were calculated. From the end of the 1st summer, large predatory forms of zooplankton such as Leptodora kindtii and Bythotrephes longimanus became the favorite food of the kilka. To evaluate the role of the kilka in a body of water the consumption of predatory and filter-feeding forms of zooplankton by the kilka school should be investigated.--Copyright 1975, Biological Abstracts, Inc.

2I. Water In Plants

PRESENCE OF SPRING AND WINTER RACES OF THE NELMA IN THE OB RIVER, (IN RUSSIAN),
N. A. Prusevich.
Ekologiya. 6(2), p 88-90, 1975.

Descriptors: *Fish, Anadromous fish, Rivers, Fish reproduction, *Spawning, Seasonal.
Identifiers: *Nelma, Ob River, Russian-SFSR, *Stendous-Leucichthys-Nelma, USSR.

The nelma (Stendous leucichthys nelma) is valuable semi-anadromous fish of the Ob basin (Russian SFSR, USSR). Two independent races of the nelma, spring and winter, exist in the Ob River. This division of the nelma into winter and spring races is a species adaptation permitting maximum use of the Upper Ob with its favorable breeding condition as a spawning ground. The winter race is probably an intermediate step from the purely semi-anadromous spring form to a freshwater form.--Copyright 1976, Biological Abstracts, Inc.

STUDY OF THE URAL RIVER BENTHOS, (IN RUSSIAN),
Tsentralnyi Nauchno-Issledovatelskii Institut Osetrovogo Khozyaistva, Guryev (USSR). Uralskii-Kaspiiskii Otdelenie.
T. I. Zachetnova.
Gidrobiol Zh. 11(2), p 34-38, 1975.

Descriptors: *Rivers, *Benthos, Population, *Biomass, Distribution, Diptera, Dragonflies, *Oligochaetes, Invertebrates.
Identifiers: *Corophiidae, *Sturgeon, *Ural River, USSR, *Zoobenthos.

Data on the quantitative distribution of zoobenthos in the lower reaches of the Ural River (USSR) are given for the 1st time. Zoobenthos is significant for reproduction of sturgeon. The species composition of the predominant forms is presented. The number of benthic invertebrates varies from 40-5740 (average, 764) samples/m2, biomass from 0.05-20.00 (average, 2.54) g/m2 and, taking into account large mollusks, 10.46 g/m2. The numbers of Oligochaeta, Corophiidae, and Chironomidae are largest. The maximum biomass was observed for Chironomidae, Oligochaeta and dragon-fly larvae. The highest density indices were those of the larvae of Chironomidae (6.64), Oligochaeta (6.18) and Corophiidae (3.67).--Copyright 1976, Biological Abstracts, Inc.

LEAF PHOTOSYNTHESIS: THE INFLUENCE OF ENVIRONMENTAL VARIABLES,
Purdue Univ., Lafayette, Ind. Dept. of Mechanical Engineering.
F. P. Incropera.
Journal of Environmental Quality, Vol, 4, No. 4, p 440-447, October-December 1975. 13 fig, 35 ref, append.

Descriptors: *Crop response, *Model studies, *Corn(Field), *Photosynthesis, Environmental effects, Environmental control, Environment, *Leaves, Mathematical models.
Identifiers: *Leaf photosynthesis.

A model is presented for the effects of light intensity and ambient temperature, relative humidity, and carbon dioxide concentration on leaf photosynthesis. The model treats diffusion and chemical processes occurring within the leaf, as well as the transfer of mass and energy between the leaf and its environment. Calculations have been performed for Zea mays L. (maize) which suggest the influence of environmental changes. Although leaf energy exchange processes act to moderate the effect of changes in the atmospheric temperature, a severe cooling trend may cause as

much as 20% reduction in photosynthesis. Under most conditions, the rate of photosynthesis is further diminished by a reduction in relative humidity. In contrast, a 20% increase in the atmospheric CO2 concentration, which is projected for the year 2000, will increase photosynthesis by approximately 15%. The calculations also suggest optimum ambient conditions for controlled growth environments such as a green house. (Skogerboe-Colorado State)

INTRODUCTION TO THE KNOWLEDGE OF FRESHWATER INVERTEBRATES AND THEIR ENVIRONMENT, (IN DUTCH),
Rijksinstituut voor Natuurbeheer, Leersun (Netherlands).
L. W. G. Higler.
Wet Meded K N N V (K Ned Natuurhist Ver), 103, p 1-40, 1975.

Descriptors: *Invertebrates, *Freshwater animals, Analytical techniques, Sampling, *Ecology, Water pollution, Energy, *Environment, *Bioindicators.
Identifiers: *Netherlands.

This introduction is meant for beginners in the study of freshwater invertebrates, students and laymen. A simple key is given for visible and moving invertebrates, leading to existing keys at the order level. Most figures are given as examples of these orders. Sampling and conservation are discussed. Some ecological principles on bio-communities are considered, based on food chain and energy flow. The various kinds of water pollution and of saprobic systems are explained. The possibilities and the failure of these systems in the Dutch waters are discussed. A number of organisms that can be used in the Netherlands as indicators of more or less polluted situations on the basis of existing saprobic systems, are described.--Copyright 1976, Biological Abstracts, Inc.

SIGNIFICANCE OF WATER VEGETATION IN DESMAN LANDS OF THE EUROPEAN SECTION OF THE USSR, (IN RUSSIAN),
Akademiya Nauk URSR, Voroshilovgrad. Voroshilovgrad State Reservation.
V. P. Samarin.
Vestn Zool. 3, p 25-28. 1975.

Descriptors: *Rivers, *Vegetation, Aquatic animals, *Mammals, *Rodents, Europe, Ecology, *Plant growth, Growth rates.
Identifiers: *Desman lands, Desmana-Moschata, *USSR.

Ecological conditions of desman lands were studied for 1971-1972 in the Voroshilovgrad State Reservation of the Ukrainian Academy of Sciences (USSR). The areas in the high-water beds of the rivers Kotorosl (the Yaroslavl Oblast), Oka (the Murom district, the Vladimir Oblast), Bityung and Khoper (the Voronezh Oblast) most densely inhabited by desman (Desmana Moschata) were also examined in the autumn of 1972. A definite relationship was found between the growth of vegetation in the rivers and density of desman .--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF OSMOTIC SUCTION ON THE GERMINATION OF WARM SEASON GRASSES, (IN JAPANESE),
Kyushu Agricultural Experiment Station, Kumamoto (Japan).
K. Okamoto, M. Kawatake, and S. Horiuchi.
J Jpn Soc Grassl Sci. 21(1), p 16-20, 1975.

Descriptors: *Grasses, Soil moisture, *Osmotic pressure, *Germination, *Sorghum.
Identifiers: Love grass, Makarikari grass, Millet, Panicum-Spp., Rhodes grass, *Osmotic suction.

This study was undertaken to obtain information for selecting the warm season grasses suitable for mineral soil which has poor physical conditions and to control the soil moisture conditions in seed bed layer by watering or other methods. The relationships between osmotic suction (+ atm) and the seed germination of warm season grasses as examined in a controlled temperature room kept at 29-30 C. Osmotic solutions were prepared and adjusted by polyethylene glycol. The germination percentage in all species lowered with the increase of osmotic suction, but the degree of decline varied considerably. Germination characteristics among the species differed by the levels of osmotic suction. In general, the germination percentage in those species with relatively small seeds such as Panicum spp. and Rhodes grass was much more severely affected and lowered by lower osmotic suction in comparison with the spp. with large seeded taxa such as Sorghum and millet. Among the species of small seed, Love grass and Makarikari grass were less severely affected. The germination rate of almost all species declined linearly with the increase of osmotic suction, but interspecific differences were not as recognizable as those observed in the decline of germination percentage.--Copyright 1976, Biological Abstracts, Inc.
W77-00422

EFFECT OF SOIL WATER SUCTION ON THE GERMINATION AND EMERGENCE OF WARM SEASON GRASSES, (IN JAPANESE),
Kyushu Agricultural Experiment Station, Kumamoto (Japan).
K. Okamoto, and S. Horiuchi.
J Jpn Soc Grassl Sci. 21(1), p 21-25, 1975.

Descriptors: *Grasses, Soil moisture, *Osmotic pressure, *Germination, Sorghum.
Identifiers: Millet, Panicum-Spp., Rhodes grass, Osmotic suction.

The interrelation between soil water suction and germination and the emergence above the soil surface after germination was investigated at 30 C constant temperature using representative warm season grasses. Water suction-water content curve of the mineral soil was tested. The percentage of germination and emergence of all spp. did not vary at the lower levels of soil water suction and decreased rapidly at some levels above the limit of water suction. The degree of such decline varied by the species and Sorghum spp. and millet emerged well in the higher levels of soil water suction. Among the small seed species, Panicum spp. and Rhodes grass were much more severely affected at increased soil water suction and decreased rapidly at some levels over the limit of water suction. Soil water suction values permitting the relative germination and emergence percentage of 0% and 50% (percentage of 0.03 atm = 100) and also that over which emergence percentage lowered rapidly are given. The rate of emergence of most species declined slowly with the increase of soil water suction at the lower levels in which the percentage of emergence did not decline and decreased rapidly at the levels above the limit of water suction. There were no differences among the species in the degree of such reduction.--Copyright 1976, Biological Abstracts, Inc.

WATER RELATIONS OF GLYCYRRHIZA GLABRA L. UNDER DESERT CONDITIONS,
Cairo Univ., Giza (Egypt). Dept. of Botany; and Cairo Univ., Giza (Egypt). Faculty of Science.
A. A. Abd El-Rahman, K. H. Batanouny, and K. M. Zayed.
Flora (Jena). 163(1/2), p 143-155, 1974.

Descriptors: *Deserts, *Plant growth substances, *Soil-water-plant relationships, *Transpiration, Osmotic pressure, *Water requirements, Moisture uptake, *Drought tolerance.
Identifiers: *Glycyrrhiza-glabra.

The water relations of G. glabra L. under desert condition, including the water expenditure, osmotic pressure of the plant sap and the water saturation deficit, were studied in different localities. Transpiration measurements show that the plant transpires at relatively higher rates than desert plants. The curves of the diurnal march of the transpiration and those of the stomatal aperture showed almost the same trend, indicating a

strong stomatal control on transpiration. There is lack of parallelism between both curves and those of the climatic factors, particularly in dry months. Two types of transpiration curves are recognized, viz. the single-peaked curves with early maximum in dry months and the dome-shaped curves without prominant peak in months with mild climatic conditions. Comparison of the mean monthly transpiration rates in 2 localities revealed that the transpiration was higher in the locality with better water supply. Generally, there is a discrepancy between the mean values of transpiration and those of vapor pressure deficit and evaporation. The plant exhibited high values of osmotic pressure and water saturation deficit which increased later in the growing season. These values were higher in the locality with relatively low available soil moisture. The plant withstands high water deficits for long periods. The mechanisms for drought endurance are discussed.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF DEHYDRATION AND ELEVATED TEMPERATURE ON LEAF CELL THERMORESISTANCE OF A DROUGHT-SENSITIVE BARLEY CULTIVAR, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Lab. of Cytophysiology and Cytoecology.
I. G. Zavadskaya, and G. G. Shukhtina.
Tsitologiya. 16(8), p 950-955, 1974.

Descriptors: *Barley, *Drought tolerance, Heat balance, *Soil-water-plant relationships, *Dehydration, Water requirements, Cultivation.
Identifiers: Hordeum-Sativum.

Dehydration of intact plants or detached leaves of the drought-sensitive barley (Hordeum sativum) cultivar 'Winer' did not affect the primary cellular thermoresistance. Heat hardening of whole plants treated with soil drought for 4 days (decrease of water content in leaves by 35%) increased resistance of cells to heating, shifting the curves towards the area of higher temperatures as compared to the curve of thermoresistance of cells heathardened in saturated state. Rapid dehydration for 3 h (loss of water in leaves by 35%) of detached leaves did not produce additional effects during heat hardening. In contrast to the situation with 'Winer' drought-sensitive varieties required prolonged dehydration treatment to obtain enhanced effect of heat hardening.--Copyright 1975, Biological Abstracts, Inc.

ON THE INFLUENCE OF WATER CURRENTS ON THE GROWTH OF HYDRORHIZAL COLONIES, (IN GERMAN),
Ruhr-Universitaet Bochum (West Germany). Institut fuer Spezials Zoologie.
V. Petriconi, and G. Plickert.
Verh Dtsch Zool Ges. 67, p 107-111, 1974.

Descriptors: *Plant growth, *Currents(Water), *Rheotropism, Method, Measurement.
Identifiers: Eirene-Viridula, *Hydrorhizal colonies, *Stolons.

A water tunnel for studying the influence of current on stolonal colonies is described. A new method for measuring rheotropism is introduced. Eirene viridula (Hydroidea) prefers growing against the direction of flow. A stolon gragment when settled perpendicular to the direction of water flow starts bipolar branching with increased unilateral outgrowth of stolons against the direction of flow; when settled parallel to the water movement, branching is unipolar against the direction of flow.--Copyright 1975, Biological Abstracts, Inc.

METHOD OF SIMULTANEOUS DETERMINATION OF WATER CONDUCTIVITY OF SOILS AND PLANTS, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Physics and Reclamation.
E. V. Shein.
Biol Nauki. 17(12), p 125-129, 1974.

Descriptors: *Water pressure, Soils, Corn(Field), Beans, Transpiration, *Soil-water-plant relationships, Water utilization, *Conductivity, *Hydraulic conductivity, Capillary conductivity.
Identifiers: Horse beans.

The water pressure in soil, roots and leaves of horse beans and corn and the transpiration of plant leaves were studied. The coefficients of water conductivity of soils and plants were then calculated. During soil drought the coefficient of water conductivity of plants is 150-200 times greater than that of soil and does not considerably affect water transport. The main part of the total resistance to water transport in the soil-plant system is concentrated in the soil.--Copyright 1975, Biological Abstracts, Inc.

SEASONAL ACTIVITY AND ENVIRONMENTAL CONTROL OF FORAGING OF THE SUBTERRANEAN TERMITE, HETEROTERMES AUREUS (SNYDER), IN A DESERT GRASSLAND,
Arizona Univ., Tucson. Dept. of Entomology.
M. I. Haverty, J. P. Lafage, and W. L. Nutting.
Life Sci. 15(6), p 1091-1101, 1974.

Descriptors: Grasslands, Deserts, *Arizona, *Sampling, *Analytical techniques, Environmental factors, Rainfall, Temperature, *Feeding rates.
Identifiers: *Foraging, *Heterotermes-Aureus, *Termites.

This research was conducted on a shrub-invaded desert grassland ecotone 40 km S of Tucson, Arizona. To examine the abiotic factors affecting or regulating foraging of subterranean termites, a modified bait sampling method using toilet paper rolls was developed. Observations of foraging activity of H. aureus (Snyder) were made during 24-h periods each wk for 1 yr. Pertinent environmental data were collected at each check. H. aureus foraged day and night throughout most of the yr with minimal activity from Dec.-Feb. Foraging intensity increased moderately in the spring and fall and was high but erratic during the summer months. The number of foragens generally increased with increasing temperature. Rainfall had little effect on foraging when daily mean soil temperature were below 20C (toilet paper roll-soil interface); however, even the slightest amount of rain during the hot summer months greatly increased foraging intensity. Above 33C, even with precipitation, foraging numbers plumeted. The number of surface foragers at any instant (Y) is best explained by the equation, $\ln Y = -0.985 - 0.0761 T + 2.928 \ln T + 0.327 \ln R$ where T is the temperature at the roll-soil interface and R is daily rainfall. It appears that foraging activity is not endogenously controlled; rather it is exogenously controlled by temperature and moisture.--Copyright 1975, Biological Abstracts, Inc.

EVOLUTIONARY ASPECT OF THE REPRODUCTIVE EVOLOGY OF SALMON OF THE GENUS SALMO IN SOME WATER BODIES OF KAMCHATKA, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. Of Ichthyology.
K. A. Savvaitova, M. V. Mina, and V. A. Maksimov.
Vopr Ikhtiol. 15(1), p 21-31, 1975.

Descriptors: *Rivers, *Salmon, Population, *Fish populations, *Spawing, Fish reproduction.
Identifiers: Kamchatka, Russian-SFSR, Salmomykiss, USSR.

The absence of freshwater populations of the Kamchatka salmon S. mykiss in the basins of small rivers of the W coast of Kamchatka (Russian SFSR, USSR) is probably due to the insufficient food content of these rivers. The absence of a migratory form in the Kamchatka River basin is due to the lack of suitable spawning grounds. During the evolution of the freshwater form of S. mykiss from the migratory form, the settlement of small streams occurred. The main factor that limited the abundance of spawning populations was apparently the lack of a spawning substrate. The high food content of the Kamchatka River basin enabled the salmon, having been transformed from a migratory to a freshwater form, to shorten the migration route (and thereby to reduce energy expenditures) while preserving the general scheme of the life cycle of the migratory form.--Copyright 1975, Biological Abstracts, Inc.

FEEDING OF SHEEFISH IN THE UPPER OB ABOVE THE DAM OF THE NOVOSIBIRSK HYDROELECTRIC STATION, (IN RUSSIAN),
Tomskii Pedagogicheskii Institut (USSR). Lab. of Ecology.
L. A. Koneva.
Biol Nauki. 16(9), p 24-27, 1973.

Descriptors: *Fish, Rivers, Dams, *Fish populations, *Fish reproduction, *Fish diets, *Growth rates.
Identifiers: Gobio-gobio, Leuciscus-idus, Novosibirsk, Perch, Pike, Ruff, Rutilus-rutilus, *Sheefish, Stenodus-leucichthys-nelma, *USSR, *Ob River.

An investigation of the feeding of the population of river-bound sheefish (Stenodus leucichthys

nelma) formed upstream of the Novosibirsk hydroelectric station dam showed age-associated and seasonal changes in the food spectrum of the sheefish in comparison with the semi-anadromous sheefish of the Ob River (USSR). The absence of competition with other predators for food and the abundance of the roach (Rutilus rutilus), which is the main food of the sheefish in all seasons, indicates that the trophic conditions in the newly created body of water are favorable for the sheefish and promote its rapid growth and high reproductive capacity. (Leuciscus idus, perch, pike, ruff, Gobio gobio and bream are also cited as food.)--Copyright 1975, Biological Abstracts, Inc.

ECOLOGICAL AND PHYSIOLOGICAL PATTERNS OF POLYARTEMIA FORCIPATA (ANOSTRACA) FROM TUNDRA WATER BODIES OF THE EAST MURMAN, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
M. B. Ivanova, and E. V. Korobtsova.
Zool Zh. 53(8), p 1140-1147, 1974.

Descriptors: *Temperature, Lakes, Sampling, Tundra, *Cold regions, *Fish physiology, Ecological distribution, Distribution patterns, Oxygen.
Identifiers: *Anostraca, Bythotrephes-longimanus, Murmansk, *Polyartemia-forcipata, Russian-SFSR, USSR, Oxygen consumption(Fish), Rate of filtration(Fish).

The effect of temperature on the intensity of O2 consumption (OC) and the rate of filtration (RF) was studied in P. forcipata. The OC was determined in specimens previously adapted to the temperature of the experiment (weight, 7.1-29 mg; duration of experiment, 4-5 h). OC calculated from body weight in P. forcipata agrees well with that calculated according to Sushchenya (1972). The RF was determined by the change of concentration of silt suspension in 1.5-2 h experiments and calculated according to Gauld (1952). OC and RF, at temperatures of 5-25C, change in the same way, and the value F/Q (ml water/mg O2) is almost constant. OC and RF attain a maximum value at 15C and then decrease with a subsequent increase of temperature. The growth curve of P. forcipata in the lake (Russian SFSR, USSR) was constructed, and the energy balance for a growing specimen was calculated from samples taken in July-Aug. K2 decreases during a life span from 0.53-0.25; C/W (ration to body weight) from 21.3-8.2%; A/W (Assimilated food to body weight) from 12.8-4.9%; and R/W (metabolic expenses to body weight) from 6.2-3.7%. Bythotrephes longimanus is mentioned as a predator.--Copyright 1975, Biological Abstracts, Inc.

GULLY DEVELOPMENT AND CONTROL: THE STATUS OF OUR KNOWLEDGE,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
B. H. Heede.
USDA For. Serv. Res. Pap. RM-169, May 1976. 42 p, 36 fig, 81 ref.

Descriptors: *Gullies, *Gully erosion, *Erosion control, *Watershed protection, *Check structures, Grassed waterways, Sediment deposition, Bank protection, Riprap, Vegetation establishment, Design criteria, Structural design, Construction, History, Reviews, Bibliographies.
Identifiers: Gully mechanics, *Gully processes, *Gully growth models, *Gully control systems, Design equations, Flow-sediment relations, Gully control history.

To establish scientific management of gullies, knowledge on gully mechanics, processes and morphology must be enhanced. Even where data on flows and sediment loads are available, the application of physical laws and known theoretical relationships require engineering judgment in predicting gully development and designing control systems. Field projects indicate that simply built rock check dams can be effective control structures. Their construction, costs, and functional relationships are therefore emphasized. (Forest Service)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 918, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, June 15, 1976. 64 p, 19 fig, 2 tab, 17 ref. OWRT A-076-MO(1), 14-31-0001-5025.

Descriptors: Watershed management, *Erosion, Digital computers, Soils, Model studies, *Mathematical models, *Agricultural watersheds, *Sediment transport, Fluid flow, Equations, Sediment load.
Identifiers: *Kinematic wave equations.

A mathematical model for analysis of flow and soil movement across an agricultural watershed is discussed. Erosion due to rainfall on upland areas is described by the continuity-of-mass transport equation and relationships for interrill sediment detachment and the interaction between flow detachment and sediment load. The fluid flow is described by the kinematic wave equations. The flow detachment and transport capacities are taken to be power functions of the flow depth. The interrill detachment is assumed to be proportional to the effective precipitation rate. The resulting two dimensional equations describe the time-space distribution of sediment concentration and transport rate. The process for combining the results for watershed analysis is outlined.

GEOMORPHOLOGICAL MAPPING APPLIED TO SOIL EROSION EVALUATION,
National Inst. of Agricultural Engineering, Silsoe (England).
A. R. Williams, and R. P. C. Morgan.
Journal of Soil and Water Conservation, Vol. 31, No. 4, p 164-168, July-August 1976. 3 fig, 20 ref.

Descriptors: *Geomorphology, *Mapping, *Soil erosion, *Aerial photography, *Erosion, Photography, Surveys, Grassed waterways, Sediments, Accelerated erosion, Soils, Maps, Evaluation.
Identifiers: Soil erosion evaluation, Erosion patterns, Ground surveys, Natural erosion, Mapping procedure, Field surveys, Panchromatic photography.

Aerial photographs provided a base for mapping soil erosion and for evaluating soil erosion hazards. Most soil erosion features were visable indirect stereoscopic image, and those that were not, could be readily inferred from tonal variations. Compared with ground surveys, use of aerial photographs minimized the time required to produce maps and lowered the cost of surveys. However, no standard technique existed for mapping soil erosion. Different countries developed their own systems of geomorphological survey. Some common features emerged from the profusion of techniques and symbolization that existed. In addition to showing the type, intensity, and location of erosion, the authors' system portrayed information on the spatial distribution of erosivity, runoff, slope length, slope steepness, slope curvature in profile and plan, relief, soil type, and plant cover. Aerial photographs of the same area taken on different dates yielded information on temporal changes in erosion patterns for construction of empirical models. Such studies allowed the evaluation of the effects of changing land use and implementation of conservation work. (Roberts-ISWS)

EROSION IN 1973-74: THE RECORD AND THE CHALLENGE,
Soil Conservation Service, Washington, D. C.
C. E. Grant.
Journal of Soil and Water Conservation, Vol. 30, No. 1, p 29-32. January-February, 1975.

Descriptors: *Erosion, *Crop production, *Agriculture, *Soil conservation.

The 1973-74 growing season in many ways was not a good one for the nation's soil and water resources. Excessive soil erosion from both wind and water accompanied the efforts of many farmers to increase crop production. Contributing to the year's poor record was some of the worst weather in years. But severe erosion could also be traced to the unwise selection of certain soils for cultivated crops as well as the existence of too few conservation measures on the land. (Skogerboe-Colo St)

SEDIMENT DISCHARGE IN THE UPPER ARROYO GRANDE AND SANTA RITA CREEK BASINS, SAN LUIS OBISPO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. M. Knott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 422, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 76-64, June 1976. 29 p, 8 fig, 9 tab, 12 ref.

Descriptors: *Sediment transport, *Sediment discharge, *Sediment yield, *California, River basins, Sediment distribution, Streamflow, Sediment load, Bed load.
Identifiers: San Louis Obispo County(Calif), *Upper Arroyo Grande basin(Calif), *Santa Rita Creek basin(Calif).

Sediment data collected in the upper Arroyo Grande and Santa Rita Creek basins, San Luis Obispo County, California, during the 1968-73 water years were analyzed to determine total sediment discharge at four stations in the basins. Water discharge and total sediment discharge at these stations, representative of the 1943-72 period, were estimated from long-term flow data for nearby gaging stations and water-sediment discharge relations determined for the 1968-73 water years. Most of the total annual sediment discharge at each station occurs during a few days each year. The quantity of sediment transported in a single day often accounts for more than 40 percent of the total annual sediment discharge. Estimated sediment discharge for the upper Arroyo Grande and Santa Rita Creek basins during the 1943-72 water years averaged 53,000 tons and 23,000 tons per year. Long-term sediment deposition in Lopez Reservoir, which is in the southern part of the upper Arroyo Grande basin, was estimated to be 35 acre-feet per year. (Woodard-USGS)

CHEMICAL WEATHERING OF GLAUCONITE,
Tripoli Univ., Libya. Dept. of Soil and Water Sciences.
G. Abudelgawad, A. L. Page, and L. J. Lund.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 567-571, May-June 1975. 3 fig, 2 tab, 26 ref.

Descriptors: *Chemical reactions, *Geologic investigations, Geological surveys, Geochemistry, Sampling, Limestone, X-ray diffraction, Mineralogy.
Identifiers: *Glauconite, *Chemical weathering, Barce Plateau(Libya).

Glauconite samples were collected from geologic cuts in the Barce Plateau in the eastern part of Libya. The glauconite was associated with limestone, dolomitic limestone, marl, marl stone, chert, and kaolinite. Samples of the glauconite from the area of study after removal of carbonates gave X-ray diffraction spacings of 10.0, 7.2, 5.0, 3.6 and 3.3 Angstroms. Spacings of 10.0, 5.0, and 3.3 Angstroms represent the 001, 002, and 003 reflection of micaceous components. Spacings of 7.2 and 3.6 Angstroms were due to kaolinite. No 060 reflection was observed for random samples. The absence of this spacing, although not entirely specific for glauconite, is indicative of glauconite-like minerals. Petrographic analysis and chemical composition confirmed that the micaceous mineral studied was glauconite. (Skogerboe-Colo St)

THE ACTIVITY CONCEPT OF PHOSPHATE-ROCK SOLUBILITY,
International Fertilizer Development Center, Florence, Ala.
S. H. Chien, and C. A. Black.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 856-858, September-October 1975. 4 fig, 11 ref.

Descriptors: *Phosphates, *Soil chemistry, Soil investigations, Chemical reactions, Florida, Geochemistry.
Identifiers: *Phosphorite, *Florida phosphate rock.

Variously treated samples of a finely ground Florida phosphate rock were equilibrated with dilute HCl solutions, and the ion-activity product of the carbonate apatite mineral in the phosphate rock was then determined from analyses made on the solutions. Constant ion-activity products or solubility-product constants were found within a certain pH range in each instance. The solubility, as reflected by the numerical value of the constant, decreased with an increase in the proportion of the phosphate rock dissolved in the solubility determination or prior thereto. After a certain portion of the phosphate rock had been dissolved, however, no further decrease in solubility was found with further extraction of the phosphate rock. These results are similar to those obtained previously with synthetic hydroxyapatite and were interpreted in the same way, namely, that the solids are not uniform but exist in a range of activities. THE MECHANISM OF PHOSPHATE FIXATION BY IRON OXIDES,
Griffith Univ., Nathan, (Australia).
R. L. Parfitt, R. J. Atkinson, and R. St. C. Smart.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 837-841, September-October 1975. 6 fig, 1 tab, 12 ref.

Descriptors: *Iron oxides, *Iron, *Phosphates, Soil chemistry, Soil investigations, Chemical reactions, Infrared spectroscopy, Geochemistry.
Identifiers: *Infrared spectroscopy, *Phosphate fixation.

Infrared spectroscopic techniques have been used to obtain a structural model for the surface reaction between iron oxides and phosphate ions. Two surface hydroxyl ions (or water molecules) are replaced by one phosphate ion. Two of the oxygen atoms of the phosphate ion are coordinated, each to a different Fe^{3+} ion, resulting in a binuclear surface complex of the type Fe-O-P(O2)-O-Fe. Evidence is given for phosphate adsorption

producing this coordination structure on the surfaces of goethite, hematite, lepidocrocite, beta-ferric hydroxide, and amorphous ferric hydroxide gel. (Skogerboe-Colo St)

STOICHIOMETRIC DISTANCE AND TOTAL CONCENTRATION: A BINARY NUMERICAL DESCRIPTION OF INLAND WATER CEHMISTRY,
Tasmania Univ., Hobart (Australia). Dept. of Botany.
R. T. Buckney.
Australian Journal of Marine and Freshwater Research, Vol. 27, No. 1, p 73 - 81, March 1976. 7 fig., 21 ref.

Descriptors: *Data processing, *Water chemistry, *Ions, *Surface waters, *Australia, Analytical techniques, Salinity, Hydrogen ion concentration, Silica, Potassium, Sodium, Calcium, Magnesium, Chlorides, Sulfates, Carbonates, Pollutant identification.
Identifiers: *Tasmania.

A method is presented by which analytical data for major ions in water may be simply presented by means of two parameters - a 'total concentration' parameter based on the total anion equivalent concentration, and a 'stoichiometric distance' parameter which expresses the relative concentrations of the major ions in the water by reference to the relative ion composition of seawater. The ions considered are those of potassium, sodium, calcium and magnesium; chloride, sulfate and carbonate-bicarbonate. The system is used to describe some features of inland waters of Tasmania (Australia), and equilibrium and other controls on pH and silica concentration are noted. Since this particular analysis is based on the observed range of ionic proportions in Tasmania, its conclusions may not be directly applicable elsewhere; but it has facilitated the identification of features which might occur more widely. HYDROGEOCHEMISTRY OF THE GENOA RIVER BASIN, NEW SOUTH WALES - VICTORIA (AUSTRALIA),
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Environmental Marine Geology.
G. E. Reinson.
Australian Journal of Marine and Freshwater Research, Vol 27, No 1, p 165-186, March 1976. 9 fig, 5 tab, 22 ref.

Descriptors: *Granites, *Weathering, *River basins, *Water chemistry, *Australia, Rock properties, Water types, Salinity, Watersheds(Basins), Calcium, Magnesium, Sodium, Bicarbonates, Chlorides, Salt balance, Surface waters, Pollutant identification.
Identifiers: Genoa River(NSW-Vic).

Two main chemical types of surface water are identified within the basin: a sodium-chloride type and a mixed-cation chloride-bicarbonate type. The genesis of the types is related to differences in the weathering rates of the granitoid rocks underlying the basin. Readily weathered rock suites yield minerals which supply calcium, magnesium, sodium and bicarbonates to the water draining them (mixed cation type), while where chemical rock weathering is slow, the surface water chemistry is dominated by atmospheric salts (sodium chloride type). This difference remains the controlling factor in the genesis of the two water types even during low runoff periods when the groundwater contribution to streamflow and the rate of evaporation are high. TRIESTE–WATER LEVELS 1952-1971; A STUDY OF THE TIDE, MEAN LEVEL, AND SEICHE ACTIVITY,
Department of the Environment, Ottawa (Ontario). Marine Environmental Data Service.
G. Godin, and L. Trotti.
Miscellaneous Special Publication 28, 1975. 24 p, 17 fig, 14 tab, 29 ref.

Descriptors: *Water levels, *Tides, *Variability, *Seiches, Waves, Gaging stations, Gages, Measurement, Data processing, Analytical techniques, Fourier analysis, Sampling, Estuaries, Harbors, Oceanography.
Identifiers: *Trieste, *Italy.

A sequence of observations on the water level at Trieste covering the interval 1952-71 was submitted to a general analysis. The sequence was divided into sub-sequences of observations of a duration of 355 days to follow the evolution of these sub-sequences. Three factors affected the water level at Trieste: (1) the tide, (2) slow variations, and (3) transient oscillations due to storms which were made evident by seiches or sudden jumps in

. The study of the tide was effected with the of sample Fourier spectra, which aided recog- n and identification of the tidal constituents. identification was checked by the evolution e Greenwich phase lag from sample to sam- If it showed a long-term trend, the identifica- of the constituent was erroneous, and it was ssary to search for a similar or neighboring tituent which could explain the same peak. A r reliable list of constituents of the tide at Tri- was set up which seemed to vary little from to year. An increase in the phases during 3 ecutive years could be attributed to a gradual uction of the stilling well. On the other hand, nean level, obtained from a low-pass filter, ed strong and often prolonged variations dur- he fall and winter and yielded to an explana- only after a deeper study of their physical es. Power spectra of the same low passes computed with the hope that they would help in this type of variation. The difference een the observed level and the predicted tide e up what is calleda 'residue': it reflected all henomena which did not have the regularity e tide. The plot of these residues from month onth allowed a rapid inspection of all that ed to exceed the norms, and the months dur- which important transients occurred were set e for a closer look. In this way, incidents of lation caused by the great Adriatic seiche of a d of 22 h, very near to that of the diurnal tide, abrupt changes in level caused by a rapid sition from a regime of sirocco to the bora or frontal passage could be isolated. MERICAL SIMULATION OF THE ARCTIC EAN CIRCULATION,
fornia Univ., Los Angeles. Dept. of eorology.
Semtner, Jr.
nal of Physical Oceanography, Vol. 6, No. 4, p 425, July 1976. 22 fig, 2 tab, 35 ref.

criptors: *Model studies, *Ocean circulation, ctic Ocean, *Mathematical models, Water cir- tion, Oceans, Winds, Temperature, Water perature, Salinity, Atmospheric pressure, Cur- s(Water), Circulation, Simulation analysis, anography.
ntifiers: *Greenland Sea.

circulation of the Arctic Ocean and Greenland was simulated using the 1969 numerical model Bryan and Cox. The coastline and bottom graphy of the region were resolved by a 110 horizontal grid spacing and by 14 vertical ls. The transfers of mass, heat, and momen- at the ocean surface and at open lateral boun- es were specified from observations. In par- lar, the pattern of wind stress was obtained g a map of mean annual atmospheric pressure; a scalar multiplier was applied to account for nonlinear dependence of stress on wind speed. ee experiments with different values of this ar multiplier were run to simulate the effect of , medium, and low wind stress. Many of the erved features of the Arctic circulation were oduced by the simulation. The observed fea- s were: the Greenland Sea exhibits cyclonic at all levels and deep convection in its central on. The Beaufort Sea shows anti-cyclonic flow ne surface and a stble stratification maintained halocline. The Arctic Ocean receives bottom er and an intermediate layer of warm Atlantic er through the Greenland-Spitsbergen Passage, its exports surface water of low salinity into ntense East Greenland Current. The sense of ulation of the Atlantic layer in the central Arc- Ocean, although opposite to that usually in- ed from water mass properties, seems to be in onable agreement with existing direct current surements. ON FORCED, LONG CONTINENTAL SHELF WAVES ON AN F-PLANE,
Oregon State Univ., Corvallis. School of Oceanography.
J. S. Allen.
Journal of Physical Oceanography, Vol. 6, No. 4, p 426-431, July 1976. 5 ref. NSF DES75-15202, NSF IDO71-04211, NSF OCE76-00596.

Descriptors: *Model studies, *Ocean waves, *Continental shelf, *Continental slope, Waves(Water), Ocean circulation, Mathematical models, Coriolis force, Fluid mechanics, Shores, Coasts, Internal waves, Mathematics, Equations, Computer models, Oceanography.
Identifiers: *Continental shelf waves, f-Plane waves.

Previous studies of forced, long continental shelf waves on an f-plane have considered motion on the shelf and slope which is driven by an alongshore component of the wind stress, essentially through the suction of fluid into the surface layer at the coast. These studies have utilized a boundary condition, which arises consistently in the longwave nondispersive limit for free shelf waves, that at the slope-interior junction the alongshore velocity component is approximately equal to zero. This is an extremely useful condition for problems concerning forced motion on the shelf and slope because it completely uncouples the motion in this region from that in the interior, and it allows the shelf-slope problem to be solved independently of the interior problem. It was shown, however, that this condition is not correct in general for wind-stress-forced f-plane motion. A proper formulation of the f-plane, forced shelf wave problem in the long wave limit was presented. The motion on the shelf and slope, in general, was coupled with and forced by the flow in the interior. (Sims-ISWS)

THE TRANSMISSION AND DECAY OF BAROTROPIC TOPOGRAPHIC ROSSBY WAVES INCIDENT ON A CONTINENTAL SHELF,
Nova Univ., Fort Lauderdale, Fla.
J. Kroll, and P. P. Niiler.
Journal of Physical Oceanography, Vol. 6, No. 4, p 432-450, July 1976. 21 fig, 10 ref. NSF GA-34149.

Descriptors: *Model studies, *Ocean waves, *New England, *Florida, *Continental shelf, Waves(Water), Ocean circulation, Mathematical models, Coriolis force, Fluid mechanics, Shores, Coasts, Topography, Mathematics, Equations, Computer models, Oceanography.
Identifiers: *Continental shelf waves, Barotropic waves, Topographic waves, Rossby waves.

It is known that long-period (greater than 1 day) and long-wavelength (greater than 100 km) topographical Rossby waves can be generated by a wind acting directly on a continental shelf. The characteristics of these waves, which can also be produced off the shelf by wind and current eddies and can propagate up to and onto the shelf, were examined. A shelf model was used which varied in depth in one direction only, and it was assumed that a shelf can be approximated by at most two breaks with the depth varying exponentially. Also assumed was velocity-dependent bottom friction to determine the effect of frictional dissipation. The following results were derived: The regression angle of scatter plots for topography-dominated waves should be small, and the preponderant direction of the waves determined by the sign. The group velocity directed up the slope possesses an absolute maximum which occurs at a relatively short period. The ability of a wave moving up a slope to overcome friction correlates with this group velocity. The energy flux transmission across one and two breaks can be determined. It was suggested that the product of this flux transmission coefficient and the group velocity component up the shelf be the criterion to determine which wavelengths and frequencies penetrate nearest to shore. It was found, however, that the energy from off the shelf is likely to be decayed completely in bottom depths less than about 25 m. A comparison of some results with data for the New England and west Florida shelf showed a general agreement. (Sims-ISWS)
W77-00132

CONTINENTAL SHELF WAVES IN THE FLORIDA STRAITS,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
F. Schott, and W. Duing.
Journal of Physical Oceanography, Vol. 6, No. 4, p 451-460, July 1976. 8 fig, 3 tab, 19 ref, 3 append. ONR N0001475-C-0173.

Descriptors: *Ocean waves, *Continental shelf, *Currents(Water), *Florida, Topography, Water circulation, Ocean circulation, Waves(Water), On-site investigations, Current meters, Data processing, Analytical techniques, Wavelengths, Oceanography.
Identifiers: *Florida Straits, *Gulf Stream, Continental shelf waves, Barotrophic waves, Wave propagation.

Current measurements from three stations along the east coast of Florida at about 300 m water depth with a maximum longshore separation of 180 km were used to analyze for the presence of propagating waves. The analysis was done by solving the inverse problem of determining the most likely wave parameters from 36 independent auto spectra and cross spectra from four current meters. For the 10-13 day band, a significant fit of the data by wave cross-spectral function was found. The wavelength was 170 km and the phase propagation 17 cm/s toward the south. The current fluctuations were elliptically polarized with anticyclonic rotation and with an axis ratio of 0.30. The mean current amplitude was 14.3 cm/s. A marginally significant fit with similar wave parameters resulted for the 7-10 day band. The results suggested that these waves were continental shelf waves, probably generated by atmospheric cold front passages. (Sims-ISWS)

ON THE FLOW THROUGH BARROW CANYON,
Washington Univ., Seattle. Dept. of Oceanography.
D. G. Mountain, L. K. Coachman, and K. Aagaard.
Journal of Physical Oceanography, Vol. 6, No. 4, p 461-470, July 1976. 12 fig, 1 tab, 9 ref. ONR N00014-67-A-0103-0014, ONR N00014-A-0103-0021.

Descriptors: *Flow, *Ocean currents, *Alaska, *Arctic Ocean, Surveys, Measurement, Current meters, Temperature, Salinity, Winds, Model studies, Mathematical models, Dynamics, Fluid mechanics, Oceanography.
Identifiers: *Barrow Canyon, *Bering Strait, *Chukchi Sea.

Simultaneous current and temperature measurements were made at two depths in Barrow Canyon for a period of 120 days from April through August, 1973. The mean of the measured currents was 25 cm/s toward the northeast, such that water moved out of the canyon from the Chukchi Sea toward the Arctic Ocean. The measurements, however, were characterized by higher speeds, commonly in excess of 50 cm/s, and large variations which resulted in periods of reversed (southwest) up-canyon motion. During these reversed flow periods, increased temperature indicated the presence in the canyon at 126 m depth of Atlantic water from 200-300 m depth in the Arctic Ocean. A close relationship existed between the measured currents and the north-south atmospheric pressure gradient, such that when the

pressure rose to the north, the northward flow of water through the canyon decreased. A simple dynamic model was presented to account for the observed current-pressure relationship. (Sims-ISWS)
W77-00134

GEOGRAPHICAL VARIABILITY OF THE INTERNAL WAVE FIELD: A SEARCH FOR SOURCES AND SINKS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
C. Wunsch.
Journal of Physical Oceanography, Vol. 6, No. 4, p 471-485, July 1976. 13 fig, 20 ref. ONR N00014-75-C-0291, NSF IDO75-03998.

Descriptors: *Internal waves, *Atlantic Ocean, *Ocean waves, On-site investigations, Surveys, Current meters, Data processing, Analytical techniques, Topography, Bathymetry, Equations, Energy, Dynamics, Waves(Water), Ocean currents, Currents(Water), Model studies, Mathematical models, Oceanography.
Identifiers: *Muir Seamount, *Gulf Stream.

Internal wave records from a variety of deep water locations in the North Atlantic have been reduced by common analysis methods in a search for systematic deviations from a universal spectral model. It was speculated that such inhomogeneities are probably necessary conditions for sources and sinks of the motion. For a number of reasons, only records at 2000 m and below were used. Real variations in energy level of up to an order of magnitude were found, but the only clear inhomogeneities were associated with bottom topography, especially in those records obtained near Muir seamount. The effects, if any, on the internal wave field by the large velocity and shear of the Gulf Stream region were weak. Apparent topographic sources were inconspicuous at very short distances, suggesting a very rapid, nonlinear recovery of the spectrum to an equilibrium form. (Sims-ISWS)
W77-00135

DETERMINATION OF LAGRANGIAN DEFORMATIONS FROM ANALYSIS OF CURRENT FOLLOWERS,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
A. Okubo, C. C. Ebbesmeyer, and J. M. Helseth.
Journal of Physical Oceanography, Vol. 6, No. 4, p 524-527, July 1976. 10 ref. NOAA 6108A, ONR N-00014-67-A-0103-0014.

Descriptors: *Data processing, *Analytical techniques, *Currents(Water), Drift bottles, Deformation, Velocity, Water circulation, Oceans, Mathematical studies, Current meters, Equations, Oceanography.
Identifiers: *Lagrangian deformations.

Methods were presented to determine Lagrangian deformations and turbulence statistics from current followers (drogues, neutrally buoyant floats, etc.). Such determinations allowed general advection-diffusion equations to be directly evaluated. Methods were also presented to transform these deformations into oceanic velocity gradients. (Sims-ISWS)
W77-00136

SEA SURFACE TEMPERATURE FLUCTUATIONS AT TIDAL FREQUENCIES AT WEATHER SHIPS CHARLIE AND DELTA,
McGill Univ., Montreal (Quebec).
T. Jakobsson.
Journal of Physical Oceanography, Vol. 6, No. 4, p 602-605, July 1976. 2 fig, 1 tab, 13 ref.

Descriptors: *Water temperature, *Atlantic Ocean, *Tidal effects, *Weather data, Temperature, Oceans, Tides, Stations, Fluctuations, Frequency, Internal waves, Topography, Data processing, Frequency analysis, Oceanography.
Identifiers: *Sea surface temperature, Spectral analysis.

Data consisting of three years of 3 h surface observations at North Atlantic ocean weather stations Charlie and Delta were analyzed by spectral analysis. Sea surface temperature variations at higher frequencies were examined in detail and some related to tidal frequencies. These occurred at Charlie. The absence of similar fluctuations at Delta was explained by the station's proximity to an amphidromic point in the North Atlantic tidal system. (Sims-ISWS)
W77-00137

TEMPERATURE-SALINITY CURVES IN THE PACIFIC AND THEIR APPLICATION TO DYNAMIC HEIGHT COMPUTATION,
Hawaii Univ., Honolulu. Dept. of Oceanography.
W. J. Emery, and R. T. Wert.
Journal of Physical Oceanography, Vol. 6, No. 4, p 613-617, July 1976. 3 fig, 8 ref.

Descriptors: *Temperature, *Salinity, *Pacific Ocean, *Oceans, Water properties, Chemical properties, Sea water, Water temperature, Physical properties, Hydrography, Oceanography.
Identifiers: *Temperature-salinity curves, *Temperature-salinity dynamic height.

Mean temperature-salinity (TS) curves were computed from all available hydrographic data from 10 deg quadrangles in the Pacific between 20 deg S and 40 deg N. These curves, together with temperature profiles from hydrographic stations, were used to compute a quantity called TS dynamic height. The rms differences between dynamic and TS dynamic height indicated where mean TS curves might be reliably used to compute dynamic height from temperature profiles. (Sims-ISWS)

BIBLIOGRAPHY ON TIDAL HYDRAULICS, SUPPLEMENTARY MATERIAL COMPILED FROM MAY 1971 TO MAY 1974, ES 816, TIDAL FLOWS IN RIVERS AND HARBORS.
Committee on Tidal Hydraulics (Army), Washington, D.C.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A013 082, Price codes: A11 in paper copy, A01 in microfiche. Report No. 2, Supplement No. 7, June 1975. 241 p.

Descriptors: *Information exchange, *Reviews, *Publications, *Bibliographies, Theoretical analysis, Sedimentation, Water pollution, Regulation, Salinity, Laboratory tests, Instrumentation, Surveys, Surveying instruments, Data collections, Tidal streams, Tidal waters, Hydraulics, Tides, Estuaries, Currents(Water).

The bibliography consisted of 670 references divided into eight sections: (1) theoretical considerations, (2) sedimentation, (3) salinity effects, (4) contamination, (5) regulation and improvement, (6) laboratory experiments, (7) surveys and instruments, and (8) basic physical data. The references were arranged alphabetically by authors' names within each section, and all references were annotated. Copies of the papers listed are available through loan within the continental United States. (Froehlich-ISWS)

VERTICAL DIFFUSION DRIVEN BY INTERNAL WAVES IN A SILL FJORD,
Norges Tekniske Hoegskole, Trondheim. River and Harbor Lab.
A. Strigebrandt.
Journal of Physical Oceanography, Vol. 6, No. 4, p 486-495, July 1976. 5 fig, 1 tab, 8 ref, append.

Descriptors: *Fjords, *Tides, *Mixing, *Internal waves, Model studies, Hydraulic models, Salinity, Saline water-freshwater interfaces, Froude number, Tidal waters, Seiches, Equations, Flow, Waves(Water), Estuaries, Path of pollutants.
Identifiers: *Norway, *Oslofjord(Norway), Sill fjord, Richardson number.

A new mechanism, the breaking of internal waves, was proposed to explain vertical mixing within the lower layers of sill fjords. The generation of the waves at the sill of a fjord was modelled, assuming constant depth except at the narrow sill whose height was the thickness of the lower layer. A barotropic tide oscillating across the sill created internal waves which propagated both seaward and landward from the sill. These waves broke against the bottom, creating boundary turbulence which mixed water of different density in the lower layer. This was demonstrated experimentally. The mixture flowed away from the boundaries into the interior of the fjord, causing an effective vertical mixing. The energy input into the internal waves and the damping of barotropic seiches were computed using linear theory. Possible instability, except at the bottom, was discounted by considering representative Richardson and Froude numbers. The theory was then qualitatively applied to the Oslofjord with particular attention given to the effects caused by changing the sill geometry. An estimate of the Richardson flux number from the Oslofjord data gave a value of 0.05. ((Sims-ISWS)

CLIMATOLOGICAL NUMERICAL MODELS OF THE SURFACE MIXED LAYER OF THE OCEAN,
Woods Hole Oceanographic Institution, Mass.
R. O. R. Y. Thompson.
Journal of Physical Oceanography Vol. 6, No. 4, p 496-503, July 1976. 7 fig, 16 ref. ONR N00014-74-C-0262-NR-083-004.

Descriptors: *Model studies, *Oceans, *Water temperature, *Pacific Ocean, Mathematical models, Forecasting, Temperature, Mixing, Thermocline, Climatology, Oceanography.
Identifiers: *Surface mixed layer, *Ocean Weather Station N(Pacific Ocean).

Three slab models of the surface mixed layer of the ocean were given simple and fast computer implementations. Actual meteorological data from Ocean Weather Station N were used for a year-long forecast. The results compared quite well with the observations of vertical temperature profiles, with correlations up to 0.98 between predicted and observed sea-surface temperatures and of 0.8 between predicted and observed mixed-layer depths. Temperature anomalies introduced in the spring can be covered up in the summer, yet reappear in the winter. A constant-thickness slab was suitable as a lower boundary for some atmospheric climatological studies if a depth of 25 m was used. The model based on a Froude number criterion worked best for the available data set; this was physically appealing since the model contained no adjustable parameters. (Sims-ISWS)
W77-00361

THE ROLE OF SURFACE MIXING IN THE SEASONAL VARIATION OF THE OCEAN THERMAL STRUCTURE,
Naval Postgraduate School, Monterey, Calif. Dept. of Meteorology.
R. L. Haney, and R. W. Davies.
Journal of Physical Oceanography, Vol. 6, No. 4, p 504-510, July 1976. 7 fig, 1 tab, 16 ref. ONR N00014-76-WR-60020.

Descriptors: *Model studies, *Oceans, *Water temperature, *Pacific Ocean, Mathematical models, Temperature, *Mixing, Seasonal, Equations, Heat transfer, Climatology, Oceanography, Meteorology.
Identifiers: *Ocean Weather Station N(Pacific Ocean).

The role of surface-generated mixing in determining the seasonal variation of the ocean thermal structure was investigated using a one-dimensional numerical model. The model contained vertical eddy diffusion with a constant coefficient K sub H = 0.5 sq cm/s, an instantaneous convective adjustment mechanism as commonly used in oceanic general circulation models, and a simple parameterization of surface-generated wind and convective mixing based on recent mixed-layer theories. Forcing on the seasonal time scale was accomplished by prescribing the atmospheric solar radiation, long-wave radiation, wind speed, temperature, and dew point to vary sinusoidally with the annual period. Results of model integrations showed that surface-generated wind and convective mixing were responsible for producing many features which were observed in the real ocean, in-

cluding the occurrence of two sea surface temperature maximai-one in summer and another in early fall. (Sims-ISWS)
W77-00362

SALT FINGERS OBSERVED IN THE MEDITERRANEAN OUTFLOW REGION (34 N, 11 W) USING A TOWED SENSOR,
Massachusetts Inst., of Tech., Cambridge. Dept. of Meteorology.
B. Magnell.
Journal of Physical Oceanography, Vol. 6, No. 4, p 511-523, July 1976. 12 fig, 16 ref. NSF GA-30729X

Descriptors: *Atlantic Ocean, *On-site investigations, *Temperature, *Salinity, Instrumentation, Oceans, Conductivity, Data collections, Data transmission, Telemetry, Thermocline, Water temperature, Saline water, Oceanography.
Identifiers: *Salt finger convection, *Mediterranean Outflow region, *Salt fingers, Towed sensors.

A towed microstructure instrument has been used to measure small-scale conductivity fluctuations in a quasi-horizontal plane, as well as local vertical gradients of temperature and conductivity. This instrument was towed in the Mediterranean Outflow region (34 deg N, 11 deg W) in July 1973, in an area where 'step-like' vertical profiles of temperature and salinity had previously been observed. It was found that intense small-scale horizontal structure (1 cycle/cm) occurred in the thermocline on the thin high-gradient sheets which separated the mixed layers of the step-like structure. Good general agreement between the observed dominant wavelength and amplitude of this structure, and expected theoretical salt finger wavelength and amplitude, strongly suggested that this activity was salt finger convection. (sims-ISWS)
W77-00363

AN INVESTIGATION OF A COLD EDDY ON THE EASTERN SIDE OF THE GULF STREAM USING NOAA 2 AND NOAA 3 SATELLITE DATA AND SHIP DATA,
Research Triangle Inst., Research Triangle Park, N. C.
F. M. Vukovich.
Journal of Physical Oceanography, Vol. 6, No. 4, p 605-612, July 1976. 12 fig, 1 tab, 4 ref. NOAA/NESS 3-35402.

Descriptors: *Eddies, *Atlantic Ocean, *Remote sensing, *On-site investigations, Satellites(Artificial), Ships, Currents(Water), Ocean currents, Circulation, Ocean circulation, Water circulation, Data processing, Temperature, Water temperature, Entrainment, Salinity, Oceanography.
Identifiers: *Gulf Stream.

A study of a cold eddy on the eastern side of the Gulf Stream was performed combining data from the NOAA 2 and NOAA 3 satellites and from the Cape Fear Technical Institute's R/V Advance II. The satellite data were used initially to identify and locate the eddy in real-time. The location data obtained from the satellite imagery were used to plan an oceanic field program using the Advance II to collect temperature and salinity data in the perturbation. The analysis of satellite data indicated that the cold eddy was elliptic in shape with the major axis varying from 180 to 120 km and a minor axis varying from 120 to 100 km. The analysis also suggested that the circulation of the eddy was entraining warm Gulf Stream water, strengthening the warm ring around the eddy. The subsurface analysis indicated that the cold eddy was characterized by a very pronounced dome of relatively cold, less saline water below 200 m. Above 200 m, the temperature and salinity were uniform, both vertically and horizontally. (Sims-ISWS)

FISHERY AND BIOLOGY OF METAPENAEUS MONOCEROS (FABRICIUS) FROM THE GODAVARI ESTUARINE SYSTEM,
Central Inland Fisheries Research Inst., Barrackpore (India).
M. Subrahmanyam.
Indian J Fish. 20(1), p 95-107, 1973.

Descriptors: *Crustaceans, *Estuaries, *Asia, Mangrove swamps, Swamps, Fish diets, *Fish genetics, *Shrimp, Shellfish, *Commercial shellfish, Fish reproduction, Asia.
Identifiers: Foraminifera, *India, *Metapenaeus-Monoceros, *Prawns, Guatami estuary.

M. monoceros (Fabricius) is one of the important commercial prawns and comprises about 42% in the total prawn landing in the Gautami estuary (India). It is abundant in the lower reaches of the estuaries, particularly in the mangrove swamps and backwaters. The main fishing season extends from Oct.-Jan./Feb. and the dominant sizes in the commercial catches range between 26 mm-65 mm. Drag nets and stake nets are the main gear employed in the fishery. Under laboratory conditions the average growth rate was about 13 mm/mo., while the estimated growth from size frequency distributions ranged between 5 mm and 15 mm/mo. The size of the prawns leaving the estuary was 45-50 mm. Laboratory experiments showed that the prawns were active at night and burrowed into the substratum during the day. The post-larvae entered the estuary in large numbers at night almo throughout the year. The overall sex ratio of t prawns was more or less unity. Plant matter, ganic detritus, small crustaceans and foramifer shells formed the main diet of the prawn.—Co right 1975, Biological Abstracts, Inc.

ON THE OCEANOGRAPHIC CONDITIONS OYSTER FARMING AREA NEAR CHUNG (IN KOREAN),
Tong-yeong Fisheries Junior Technical (Republic of Korea).
D. B. Lim, C. Hwan Cho, and W. Sup Kwon.
Bull Korean Fish Soc. 8(2), p 61-67, 1975.

Descriptors: *Oysters, *Shellfish farm *Environmental effects, Bays, Oceans, Fish trol agents, Fish behavior, *Aquacul Oceanography, Chlorophyll, Mortality, Salini
Identifiers: Chungmu(Korea), *Korea.

Oceanographic conditions in the coastal water round Chungmu, one of the most important yster farming areas in Korea, were studied from lay-Nov. 1974 to determine the environmental in-uences on oyster farming. Six localities, Goseong ay, Jaran Bay, off Saryangdo, Hansilpo, Tong-eong Bay and Juklimpo were selected for onthly oceanographic observation and biological ampling. Flood current running westward brings a line water from the SE and ebb current brings e low salinity water of Jinju Bay into the area. he waters in Juklimpo, Hansilpo and Tong-yeong ay are slightly cooler and more saline than the aters in Goseong Bay, Jaran Bay and off aryangdo. The amount of dissolved O2 is lowest Sept. and Hansilpo has the least O2 during mmer. Silicate content is lower in waters of ong-yeong Bay, Juklimpo and off Saryangdo an those of Goseong Bay, Hansilpo and Jaran ay. Suspended matter in this area ranges from 2-16.6 mg/l; it is scarce in Jaran Bay, Juklimpo nd off Saryangdo. Chlorophyll a shows large easonal variation and local fluctuation. Composi-on of phytoplankton reveals the difference etween the waters of Goseong Bay, Jaran Bay nd off Saryangdo and the waters of Hansilpo, ong-yeong Bay and Juklimpo. The growth of ysters was good in Juklimpo, Tong-yeong Bay nd Goseong Bay and worst in Hansilpo. The ighest mortality (82%) was observed in the waters ff Saryangdo.--Copyright 1976, Biological Ab-racts, Inc.

IET OF HIPPOGLOSSINA MACROPS STEINDACHNER) IN MEJILLONES (PISCES, OTHIDAE), (IN SPANISH),
Universidad de Norte, Antofagasta (Chile).
Tomicic-K.
Mus Nac Hist Nat Not Mens (Santiago). 17(205), p 7, 1973.

Descriptors: *Fish diets, Fish, Fish food organ-ms, Bays, South American, Crustaceans.
Identifiers: Pisces, Bothidae, *Chile, Hippoglossina-Macrops, *Mejillones Bay(Chile), Deuroncodes-Monodon.

pecimens (287) of H. macrops, captured at Mejil-nes Bay (Chile) from Aug.-Nov. 1971, were mea-ured (total length) and the stomach contents were nalyzed. The preferred food is crustaceans. The ngth frequency distribution shows 3 clear modal roups. The feeding of the 3 groups was com-ared; groups I and III have almost completely dif-erent diets. Both groups probably occupy dif-erent ecological niches. Group II is the transition etween group I and group III. Only 1 animal, Deuronocodes monodon, was found in the diet of 1 3 modal groups.--Copyright 1975, Biological bstracts, Inc.

ENTHIC BIONOMY OF THE CONTINENTAL HELF OF THE FRENCH CATALONIAN OAST: 8. MACROFAUNA AND MEIOFAUNA, UANTITATIVE AND BIOCENOTIC RELA-IONS, (IN FRENCH),
Museum National d'Histoire Naturelle, Paris France). Laboratoire de Biologie des Invertebres arins.
. Guille, and J. Soyer.
ie Milieu Ser B Oceanogr. 24(2), p 301-320, 1974.

Descriptors: Wildlife, *Copecods, Aquatic life, ankton, Seston, Zooplankton, Crustaceans, Europe, *Aquatic populations, Population, *Analysis, *Continental Shelf, *Benthic fauna, Ecology.
Identifiers: Bionomy, Catalonian coast, Fauna, Taxocenosis, *France.

In qualitative terms, the distribution of the populations of harpacticoid copepods on the continental shelf of the French catalonian coast corresponds largely to the distribution of the communities of the macrofauna. Complementary units or bionomical subdivisions may be distinguished according to the higher sensitibility of the meiofauna to the physicochemial conditions, mainly thermal and granulometric. The structure of the populations of the 2 stocks shows that the high specific diversity of the harpacticoids varies only to a certain extent with different populations; the different populations; the different groups forming the macrofauna generally show a preference for 1 type of biotope. These comparisons between taxocenoses, and between taxocenoses and biocenoses, seem to improve the bionomical definition of a region in spite of the different dimensional levels of the ecological niches of the taxa considered. The density of macrobenthos is feeble as compared to the densities in the boreal zone; the quantity of meiobenthic organisms is very similar. The latter category shows, a higher relative importance which is apparently related to its capacity to occupy small ecological niches and to proliferate in areas not favoring the development of macrofauna. The numerical quantitative evolution of the 2 stocks is parallel, being related to the bathymetry. The biomass of the macrobenthos may be relatively independent of the density because of the diversity in the size of its components, in contrast to the meiobenthos. The weight ratio shows that the meiobenthos comprises 4.75% of the biomass of the macrobenthos. On the continental shelf of the French catalonian coast, the importance of the meiobenthos in terms of ingested food and biomass entering the food chain is about 24%.--Copyright 1976, Biological Abstracts, Inc.

FINAL REPORT ON AN INVESTIGATION OF PRECIPITATING ICE CRYSTALS FROM NATURAL AND SEEDED WINTER OROGRAPHIC CLOUDS,
Western Scientific Services, Inc., Fort Collins, Colo.
L. Vardiman, and C. L. Hartzell.
Report SR-359-4, June 1976. 129 p, 98 fig, 8 tab, 11 ref, 5 append. Bureau of Reclamation 14-06-D-6644.

Descriptors: *Weather modification, Cloud physics, *Ice crystals, *Colorado, Rocky mountain region, *Orographic clouds, *Cloud seeding, Silver iodide.
Identifiers: San Juan Mountains(Colo).

Findings are presented of an investigation into the changes expected in ice crystal characteristics caused by silver iodide seeding of winter, orographic clouds in the San Juan Mountains of Colorado. Ice crystal data were collected from 22 storms near Wolf Creek Pass for the period of February 1973 through March 1975. Additional data on ice nuclei and cloud-top temperatures were also obtained. Analyses were performed on the crystal type, size, concentration, and the amount of rime under seeded and natural conditions. The storms were subdivided into three-hour blocks based on sounding times. Each block was classified into a seed or nonseed category depending on generator operations and ice nucleus concentrations. A total of 66 three-hour blocks was studied. Changes in ice crystal characteristics were observed near Wolf Creek Pass when artificial nuclei were detected in and slightly upwind of the target area. Precipitation and ice crystal concentrations were increased and riming was decreased as expected. Relative concentrations of plates and columns were increased. Crystal diameter was increased against expectation. Ice crystal concentration measured at KP3 does not appear to be a function of cloud-top temperature for either seeded or nonseeded cases. However, seeding does increase the crystal concentration at all temperatures. (Bur Reclam)

COPING WITH INCREASING COSTS,
Black and Veatch, Kansas City, Mo.
R. F. Banker.
Journal American Water Works Association, Vol. 67, No. 11, p. 600-603, 1976.

Descriptors: *Water costs, *Inflation(Economic), *Water works, Peak loads, Financing, Water loss, Water rates, Economic efficiency, Capital costs, Operating costs, Maintenance costs.

The impact on water utilities of inflationary increases in unit costs of service and how to cope with them are discussed. Costs for electrical energy, supplies, and salaries plus fringe benefits usually cannot be controlled by the utility, but the utility can practice sound management, control purchase amounts, and use supplies efficiently. An objective study of utility operations might indicate areas for increased efficiency. Sometimes capital expenditures to improve service and system reliability can reduce operating expenses. Although operating expense increases affect the utility immediately, ultimately costs related to new capital investment affect the total budget. Sound facility design is essential. Alternatives for financing construction might reduce costs. System losses should be determined and eliminated. Peak demands should be smoothed; by improving the system-load factor, excess capacity in existing systems might meet growth requirements without increasing investment. When rate increases are necessary, public offficials and citizens must be assured that the system is well-run and that each is paying only a fair share of costs. Costs should be proportionally distributed when multiple services are provided by the water utility. New customers should finance system growth to prevent increased rates for all customers. ENVIRONMENT, ENERGY, AND CAPITAL IN THE FOSSIL FUELED ELECTRIC POWER INDUSTRY,
Houston Univ., Tex.
R. G. Thompson, L. T. Moore, J. A. Calloway, H. P. Young, and R. J. Lievano.
Computers and Operations Research, Vol. 3, No. 2/3, p 241-257, August 1976. 9 fig, 12 tab, 14 ref.

Descriptors: *Environment, *Linear programming, *Economics, *Electric power industry, *Fossil fuels, *Energy, Evaluation, Management, Capital costs, Operating costs, Marginal costs, Optimization, Waste treatment, Water quality control, Effluents, Air quality, Water, Utilization, Wastes, Mathematical models, Systems analysis.
Identifiers: Cost minimization.

Shown is how cost-conscious managers in the fossil-fueled electric power industry would respond to legislated environmental policy, increasing electricity requirements, higher resource prices, and decreased capital availability. A linear programming economic model has been used to evaluate how managers would substitute production processes, factor inputs (fuel, water, capital), and waste discharges for each specification of environmental policy and availabilities of energy and capital. The model synthesizes the important technical information into a comprehensive economic basis for analysis. All prices and costs are in constant 1973 dollars. According to results, imposition of the most stringent environmental constraint increased production costs by 50%. Stringent air pollution criteria causes shifts both away from use of high-sulfur coal and toward generation by new technologies. As electricity requirements increased, effluent standards became more restrictive, clean fuel became scarcer, shifts toward generation by the new technologies again occurred and marginal and average costs of production increased. Demand by utilities for low-sulfur coal was especially sensitive to the price of coal. Capital requirements for utilities through 1985 generally fell within forecast limits of availability from the economy except for the lowest forecast of captial availability. (Bell-Cornell)

MARINE SAND AND GRAVEL MINING,
Geological Survey, Menlo Park, Calif. Conservation Div.
M. J. Cruckshank, and H. D. Hess.
Oceanus, Vol. 19, No. 1, p. 32-44, 1975. 11 fig., 2 tab., 14 ref.

Descriptors: *Continental margin, *Sands, *Gravels, *Mining, Environmental effects, Dredging, Costs, Monitoring.
Identifiers: *Marine mining.

Based on current projections the world's terrestrial supply of sand and gravel will be depleted by the year 2000. To meet anticipated needs, sand and gravel deposits on the coastal margins are being considered. Marine aggregates mining has been very limited in the United States since public protests have resulted in dredging moratoria in most coastal areas. Costs would be competitive with those on land. It has been estimated that about 1400 billion tons are present in all U.S. coastal regions in a ratio of about 15 to 1, sand to gravel. Underwater mining is usually by a dredge that digs a pit or one that skims off the top layer of material. Environmentally this may alter the sea floor shape, interfere with other uses, and disturb marine ecosystems. Both beneficial and adverse effects are possible. Resource conservation and environmental management research is needed. Continual monitoring will be required. Adverse environmental effects are probably more damaging to physical features of coastal areas and the resource base than the ecology. With adequate information on the deposits and environment, sound resource management practices could prevent or minimize damage of mining operations. (Buchanan-Davidson-Wisconsin).

ntifiers: *Chemical recovery, *Kraft mills, shing(Pulp), Black liquor, White liquor.

review of the literature on NaCl in alkaline ping and chemical recovery is presented. The ut of NaCl with wood, chemicals, and water ply, the history of NaCl accumulation in overy systems, and methods available for Cl control and removal are reviewed. In the ef-ent recovery program, all effluents from a D/CEDED bleach plant are used to wash the brown stock and to prepare fresh cooking liquor. Sodium chloride, as a spent bleaching chemical, thereby enters the pulping chemical recovery cycle. White liquor is evaporated to recover the NaCl in pure crystalline form and to control NaCl load in the recovery cycle by the salt recovery process (SRP). Alkaline pulping and chemical recovery operations are not significantly affected by the moderate NaCl concentrations and loads which result from the proposed system. There is no apparent effect of NaCl on cooking, brown stock washing, black liquor evaporation, or white liquor preparation. Some of the properties of black liquor, smelt, and furnace dust are changed, but no significant effect results. (See also W74-07379 and W74-05275) (Sykes-IPC)

WEATHER-DEPENDENT PRICING FOR WATER RESOURCES IN THE TEXAS HIGH PLAINS,
International Bank for Reconstruction and Development, Washington, D. C.
M. N. Lane, and S. C. Littlechild.
Water Resources Research, Vol. 12, No. 4, p 599-605, August 1976. 4 tab, 9 ref.

Descriptors: *Irrigation water, *Pricing, *Linear programming, Optimization, Weather, Reservoirs, Water supply, Farms, Profit, Crops, Constraints, Costs, Rainfall, Equations, Mathematical models, Systems analysis.
Identifiers: Uncertainty, High Plains of Texas.

Two alternative schemes for pricing irrigation water are examined. Under the first scheme, price is independent of weather; in the second scheme, price varies with weather so as to generate just enough demand to exhaust reservoir capacity. The second scheme provides savings through the more efficient utilization of available reservoir supplies and through the curtailing of demand so as to allow the construction of smaller reservoirs. The analysis proceeds by means of a linear programming under uncertainty model of a representative farm. The model is applied to the High Plains of Texas. Results suggest that the weather-dependent pricing scheme would increase farm profits by the order of 10%per annum.

USING LINEAR PROGRAMMING TO EVALUATE AGRICULTURAL FLOOD CONTROL PROJECTS,
Economic Research Service, Berkeley, Calif. Natural Resource Economics Div.
D. G. Piper.
Journal of Soil and Water Conservation, Vol. 30, No. 5, p. 227-230, 1975. 1 fig., 3 tab., 8 ref.

Descriptors: *Cost-benefit analysis, *Agriculture, *Project benefits, *Flood control, *Evaluation, Linear programming, Model studies, River basin development, Water resources development, Crop production, Flood protection, *Indiana.
Identifiers: Wabash River Basin(Ind).

A regional least-cost linear programming model for river basin planning was developed to identify the economic potential for water resource development as related to agricultural production. It is based on the assumptions that the region is internally homogeneous in each soil management group; constant returns per acre are obtained for each soil management group; available cropland acreage limits production and all crops compete for it; farmers minimize crop production costs; demands for food and fiber are exogenously determined and known; and available resources, input-output coefficients, and prices are known. If appropriately modified, this model can be used as an analytical framework and data base to evaluate agricultural benefits of proposed flood-control projects. Such a project evaluation model can estimate the cost of producing specified outputs from an area under conditions of present flood hazards and with flood protection. Differences between these two estimates provide a single measure of benefits reflecting direct damage reduction and net regional enhancement effects. The model also can provide estimates of probable land use changes associated with a change in the level of flood protection. (Buchanan-Davidson--Wisconsin)

VARIATIONS IN THE NATURAL ABUNDANCE OF N OF WHEAT PLANTS IN RELATION TO FERTILIZER NITROGEN APPLICATIONS,
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
G. Shearer, and J. O. Legg.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 896-901, September-October 1975. 4 fig, 3 tab, 11 ref.

Descriptors: *Nitrogen, *Fertilization, *Fertilizers, *Wheat, Crop response, *Pennsylvania, Measurement, Laboratory tests.
Identifiers: *Soil fertility.

Measurements were made by two laboratories of the per mill (15)N excess of winter wheat plants grown at five locations in Pennsylvania on experimental plots. The plots were fertilized with N at various rates. The results from both laboratories showed a consistent decline in per mill (15)N excess with increasing rates of N application. Such a decrease in per mill (15)N excess is consistent with increasing contributions of fertilizer N to the plants as the rate of application increased, given that fertilizer N has a lower 15N content than the soil N. The coefficients of regression of per mill (15)N excess of wheat on N application rate were always negative and usually significantly different from zero. The regression coefficients computed from the results of the two laboratories were not significantly different from each other in 12 of 16 experiments. There was, however, a systematic, unexplained difference in the results from the two laboratories. A regression of one set of data on the other resulted in a regression coefficient significantly different from one, the theoretically expected value. (Skogerboe-Colo St)

ECONOMICS OF INCREASED MOBILITY FROM TILE DRAINAGE,
Mosul Univ. (Iraq). Coll. of Engineering.
A. S. Y. Aldabagh, and C. E. Beer.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 1, p 116-121, January-February 1975. 4 fig, 3 tab, 16 ref.

Descriptors: *Drainage, *Drainage engineering, *Drains, *Drainage systems, Economics, Economic impact, *Tile drains, Cost estimates.

The purpose was to estimate the added economic benefit of tile drainage from increased mobility of agricultural machinery. This was achieved by first relating the performance of vehicles to soil strength in terms of rating cone index. The rating cone index was evaluated by the cone penetrometer and remolding equipment. Relations then were developed between soil strength, moisture content, and depth to water table for poorly drained soils. Existing data were used in predicting the behavior of water table for various drain spacings and soil conductivities. A tile depth of 4 ft, a tile diameter of 0.5 ft, and a depth to the impervious layer below the drain of 4 ft, were assumed. The results were applied to determine the increased number of days in which machine operations can be performed during the planting season when tile drains with various spacings are used. Information Series No. 16, June 1975. 61 p.

Descriptors: *Irrigation, *Irrigation effects, *Irrigation practices, *Irrigation design, *Irrigation efficiency, *Irrigation engineering, *Irrigation systems, Evapotranspiration, Fertilization, Crop response, *Bibliographies.
Identifiers: *Trickle irrigation, *Drip irrigation.

Trickle irrigation (or drip irrigation) is a relatively new approach to supplying agricultural crops with moisture where natural precipitation is inadequate. Research relating to trickle irrigation is being conducted throughout the world, including a significant effort in the United States. To date the application of this irrigation method in Colorado has been considered feasible only in orchards or greenhouses. However, increased emphasis on improving irrigation water management capabilities for salinity control, revegetation of lands disturbed by mining activities, etc. necessitates further examination. This report presents a compilation of 182 annotated references from approximately 30 sources of technical literature. Its purpose is to allow the reader to assess the existing knowledge and evaluate information relevant to the problems being encountered as well as indicating where further study is necessary. A key word index is provided as an appendix. (Skogerboe-Colo St)

Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975, Chicago, Illinois, 15 p, 8 fig, 2 tab, 7 ref.

Descriptors: *Irrigation, *Irrigation systems, Irrigation design, Irrigation effects, Irrigation efficiency, Irrigation practices, Water conservation, Soil moisture, Soil moisture movement, Design criteria, Construction, Operations

Criteria for the design, construction, and operation of an experimental buried lateral, gravity multiset irrigation system are presented. The system has a potential water application efficiency of 80% with very little runoff or erosion without automatic controls. With automatic controls and with water available on demand, light, frequent irrigations can be applied with efficiencies of 90 to 95%. The energy required to operate the system is minimal and labor requirements involve only periodic inspection and maintenance services. Cost and benefit estimates indicate that this system may be economically feasible, practical, and attractive at a time of rising energy costs and labor shortages. (Skogerboe-Colo St)

Descriptors: *Computer models, *Water balance, *Wheat, *Available moisture, *Crop production, Water storage, Soil moisture, Soil-water-plant relationships, Water requirements, Evapotranspiration, *Australia.

A water balance model has been developed to simulate the soil water regime under wheat in southern Australia. Two soil layers are considered, broadly corresponding to the surface and subsoil horizons, on which the growing root zone of the crop is imposed. Required inputs for weather are daily rainfall and potential evaporation, and for the soil, the upper and lower limits of available water, field capacity and wilting point, and an initial starting point value for stored water. The performance of the model in predicting available water was best when the rate of uptake of soil water was limited by the length of roots in the subsoil. For ten crops covering three years, the discrepancy between predicted and measured stored water in the soil rarely exceeded one cm. A useful index of the water supply factor related to crop yield is given. The total water evaporated by the crop from seeding to standard week number accounted for 86 per cent of the variability in yield on ten well-documented sites. Details of the FORTRAN IV computer programme are given in an apendix. (CSIRO)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

APPLICATION OF A HYDROLOGIC MODEL TO THE PLANNING AND DESIGN OF STORM DRAINAGE SYSTEMS FOR URBAN AREAS,
Utah Water Research Lab., Logan.
G. B. Shih, E. K. Israelsen, R. N. Parnell, Jr., and J. P. Riley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 639, Price codes: A05 in paper copy, A01 in microfiche. Publication PRWG86-1, May 1976. 79 p, 46 fig, 5 tab, 18 ref, 2 append. OWRT B-048-UTAH(1). 14-31-0001-3341.

Descriptors: Hydrographs, Economic prediction, Water resources development, Management, Computer programs, *Utah, *Model studies, *Planning, *Design criteria, Storm drains, *Storm runoff, *Urban drainage, Urban runoff, Simulation analysis, Watersheds(Basins).
Identifiers: Jordan River(Utah), Salt Lake County(Utah), *Urban watersheds.

A generally applicable hybrid computer program is developed to simulate runoff from urban watersheds, and is applied to represent the outflow hydrographs of three urban watersheds located within Salt Lake County, Utah. The gaged outflow of the watersheds provided a means for comparing the observed and the simulated final outflow hydrographs. Each of the three watersheds was subdivided into spatial units or subzones, and the outflow hydrographs for each subzone were obtained by abstracting interception, infiltration, and depression storage from the rainfall hyetograph of each subzone. The resulting hydrograph outflow of each subzone then was routed to the Jordan River, the final outflow point of the three watersheds. The final hydrographs of the three watersheds were combined and compared with the gaged flow. The unique features of this model are its ability to (1) accept a wide range of input hyetographs; (2) accommodate variable loss rates; (3) combine subzone hydrographs; and (4) combine watershed hydrographs into a single runoff function. In addition to numerical output, graphs can be plotted for visual inspection. This characteristic enables designers and planners to use the model to examine quickly both the physical and economic impacts of various possible input conditions and management alternatives.

FLOOD HAZARD ANALYSIS: CROOKED RIVER, TOWN OF CASCO, TOWN OF NAPLES, CUMBERLAND COUNTY, MAINE,
Soil Conservation Service, Orono, Maine.
Prepared for Casco and Naples, Maine, December 1974. 16 p, 4 fig, 21 plates, 3 tab.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Maine, Streamflow forecasting, Peak discharge, Floodways, Flood protection, Non-structural alternatives, Control structures.
Identifiers: *Crooked River(ME), *Casco(ME), *Naples(ME), 100-year flood, Songo River(ME), 500-year flood.

Land use in the Crooked River Watershed is approximately 90% forest. Less than 1% of the land is urbanized or in recreational use, but this is expected to reach 2.8% by 1980. This watershed drains 152 square miles at its confluence with Songo River. Channel length in the study area is about 14 miles, from Tea Swamp to Sebago River. There is one dam in poor condition at Edes Falls. Fluctuation of the Sebago Lake level affects the stream bank erosion and flooding potential along lower reaches of the Songo and Crooked Rivers. There are no streamgages on Crooked River, but on the down-stream Sebago Lake, a high was recorded in 1936 which was considered a 50-year frequency event. Most floods occur in March through May and in November, the remainder being spread throughout the year. Projections on 10, 100 and 500 year frequency floods are presented in the form of flood profiles and flood plain maps. In a 100-year flood a peak discharge of 11,000 cubic feet per second is predicted for Crooked Creek at its confluence with Songo River. In a 500-year flood, a discharge of 14,800 cfs is anticipated. This report serves as a technical base upon which to formulate flood reduction measures, but does not detail such methods. A 1971 Maine law, 'Mandatory Zoning and Subdivision Control' requires municipal governments to adopt ordinances for shoreline areas. (Smith-North Carolina)

FLOOD PLAIN INFORMATION: REPORT ON RANCOCAS CREEK, BURLINGTON COUNTY, NJ (SUMMARY REPORT).
Army Engineer District, Philadelphia, Pa.
Prepared for Burlington County Planning Board, April 1967. 12 p, 8 fig, 10 plates.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Non-structural alternatives, *New Jersey, Floodwater, Streamflow forecasting, Maximum probable flood, Historic floods, Peak discharge, Flood plain zoning, Building codes, Reservoirs, Diversion structures, Channel improvement, Floodproofing.

Identifiers: *Rancocas Creek(NJ), Burlington County(NJ), Mount Holly(NJ), *Flood plain management, Standard Project Flood, Intermediate Regional Flood, Subdivision regulations.

Information is given on one mile of Rancocas Creek, 22 miles of the South Branch Rancocas Creek, and 12 miles of the North Branch Rancocas Creek. Floodplains along these streams are low flat marshlands in the tidal reaches in some sections and low, sometimes wooded, areas in other sections. The most extensively developed area is in Mount Holly, NJ along the North Branch of Rancocas Creek. Between 1960 - 1990, population in Burlington County is expected to double and, therefore, pressure to develop floodplains will be great. Development, with its concomitant increase in impervious surfaces, will increase flood hazards. A flood in 1940 is considered the greatest flood because it produced record high flows and flood stages. Ten inches of rain fell causing dams at Taunton and Medford Lakes to fail, resulting in flooding downstream. Property damage in Mount Holly alone was $129,000. Large floods generally occur in summer and early fall, however, lesser floods may occur at all times of the year. Maps and profiles give information on a 20-year flood, 100-year flood and Standard Project Flood. Flooding problems in this area can be compounded when high waters occur at times of high tide on the Delaware River. In 1944 the Corps of Engineers completed a $283,700 flood control project which included channel improvements, a diversion channel and a cut-off channel. This protects the business section of Mount Holly. Local dams and reservoirs also provide a small amount of protection. Guidelines for floodplain management are presented. (Smith-North Carolina).

FLOOD PLAIN INFORMATION: SOUTHAMPTON COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for Southampton County, Virginia. June 1975. 24 p, 6 fig, 25 plates, 6 tab.

Descriptors: *Virginia, *River forecasting, *Flood profiles, *Flood stages, *Flood plains, Floods, Regional flood, Flood flow, Hurricanes, Historic floods, Flood data, Peak discharge.
Identifiers: *Standard Project Flood, *Intermediate Regional Flood, Courtland(VA), *Nottoway River(VA).

Except for the town of Courtland, properties along the Nottoway River are relatively undeveloped and consist of marsh, woodlands, farms and open space. These areas may come under pressure to develop, as the zone is very accessible by major highways. Southampton County is the leading hog producing county in Virginia and leads in peanut production in both the state and nation. The drainage area of the Nottoway River at its mouth is 1,695 sq mi. It joins the Blackwater River to form the Chowan River. The channel is generally well-defined and overbank areas are generally covered with vegetation. Floods occur in all seasons and result from intense rain or tropical hurricanes. Six large floods have occurred since 1940; the largest, in 1940, had a peak discharge or 48,000 cubic feet per second. Damaged were houses, roads, bridges and some deaths occurred. In an Intermediate Regional Flood (IRF) a peak discharge of 34,500 cfs and water velocities of 3.7 feet per second in the main channel and 1.6 ft/sec in the overbank area are expected. It is anticipated that it would take 68 hours to reach flood peak after flood stage is reached, with flood stage lasting 185 hours. A Standard Project Flood (SPF) would have a peak discharge of 54,000 cfs, slightly higher than the 1940 flood. Water velocities would be 3.8 and 1.7 ft/sec in the main channel and overbank, respectively. Time of rise would be about 116 hours and flood stage would last 252 hours. During an ERF, 5 of 8 bridges would be obstructive to flow and 7 would be obstructive during the SPF. In either flood, approach roadways on 3 highways will be submerged before water reaches low steel elevations on bridges. There are no existing flood control structures. The 100-year flood plain is governed by the State Building Code. (Smith-North Carolina)
W77-00104

FLOOD PLAIN INFORMATION: RESURRECTION RIVER AND SALMON CREEK, ALASKA.
Army Engineer District, Anchorage, Alaska.
Prepared for Kenai Peninsula Borough, Alaska. June 1975. 24 p, 12 fig, 18 plates, 3 tab.

Descriptors: *Alaska, *Floods, *Flood profiles, *Bank erosion, *Flood plains, *Tsunamis, Streamflow forecasting, Maximum probable flood, River forecasting, Historic floods, Flood data, Peak discharge, Flood damage, Erosion, Snowmelt.
Identifiers: *Resurrection River(AK), *Salmon Creek(Ak), Seward(AK), 100-year flood, 500-year flood, Channel changes.

Properties along the streams are mostly residential, and open spaces in the flood plain are now under pressure to develop. Though population of Seward has declined in recent years to 1,891 in 1974, future growth is expected. Resurrection River is glacial fed with a steep gradient through its drainage area of about 170 sq mi. Salmon Creek, a tributary of Resurrection River, has a drainage area of 36 sq mi. It has a steep braided channel and has overflowed its banks several times in recent years. Floods usually occur from August through November or in Spring; primary cause of flooding is rapid runoff during heavy rains. Little historic flood data exist, though floods have been recorded on one or both rivers since 1946. In a 100-year flood, it is anticipated that peak flows on Resurrection River and Salmon Creek will be 55,000 and 16,000 cubic feet per second, respectively. Velocities of up to 10 feet per second in the main channel and 3 ft/sec in the overland area are expected. A 500-year flood would have a peak discharge of 82,000 cfs and 24,000 cfs on Resurrection River and Salmon Creek, respectively Water velocities would be slightly higher than during the 100-year flood. Seward, located at the mouth of Resurrection River and at head of Resurrection Bay, is subject to riverine and coastal flooding. A tsunami like the one which occurred following the 1964 Alaska earthquake is rarer than the 500-year flood. The wave in 1964 caused extensive damage. Erosion of the alluvial material on the flood plain has been a problem in the past and is expected to be a problem in future floods. There are no existing flood control structures or flood plain management regulations in force. (Smith-North Carolina)

OPTIMAL DESIGN OF SINGLE RESERVOIR SYSTEM USING (DELTA) RELASE POLICY,
California Polytechnic State Univ., San Luis Obispo. Dept. of Computer Science and Statistics.
S. S. Luthra, and S. R. Arora.
Water Resources Research, Vol. 12, No. 4, p 606-612, August 1976. 3 fig 5 tab, 4 ref.

Descriptors: *Multiple-purpose reservoirs, *Design, *Reservoir releases, Water policy, Optimization, Inflow, Economics, Costs, Equations, Mathematical models, Systems analysis.
Identifiers: *Chance-constrained programming, Cost minimization, Linear decision rule, *Reservoir capacity.

Reservoirs provide storage capacity which serves to match more ideally the demands and supplies of water. The amount of storage required very criti cally depends upon the constraints on freeboard minimum pool level, and upon the permissibl limits on releases. Release policy also plays a ver critical role. During recent years, one of the poli cies which has attracted much attention is th linear decision rule policy. This policy passes o the variability of a particular period's inflow to th next period's release. Another release policy i presented, the delta release policy, where delta is parameter whose value distributes the effects o inflow variability between the releases and th pool level. It is shown that delta release polic requires smaller reservoir capacity than that ob tained by the linear decision rule policy. The op timization problem is formulated as a chance-con strained programming problem for minimizing th cost of the reservoir. (Bell-Cornell)

ECONOMIC OPTIMUM RECORD LENGTH,
Nielsen and Rauschenberger A/S. Lyngb (Denmark).
S. Jacobi.
Nordic Hydrology, Vol. 6, No. 1,p 28-42, 1975. fig, 9 ref.

Descriptors: *Stochastic processe *Optimization, *Hydrology, *Design, *Decisio making, *Reservoirs, Monte Carlo method Simulation analysis, Storage, Projects, Sedimen load, Marginal costs, Marginal benefits, Data co lections, Mathematical models, Equation Systems analysis.
Identifiers: *Cost minimization, *Record lengt *Expected opportunity loss, *Uncertainty *Bayesian design approach.

Uncertainty in hydrologic design parameters reflected as an increase in expected project cost The Bayesian or statistical decision approac produces a minimum-cost decision for a specif design, yielding the expected opportunity los EOL, a measure of the uncertainty inherent in th decision process. The uncertainty stems from th fact that the population value of the desig parameters is unknown. Additional informatio can be obtained by collecting more data, and th value of these data is measured by the decrease EOL. But there are costs involved in getting add tional data: the cost of continued data collectio and the costs of delaying the construction of th project (benefits foregone). The expecte economic optimum record length is defined at th point where the marginal benefits of addition data are equal to the marginal costs of obtainin those data. The theory is applied to sediment los data used to design the sediment storage portion a reservoir. Based on an economic efficienc criterion, the expected optimum record length found to be 12 years, given that 5 years of data a available at the time of the analysis. Objective like environmental quality and social benefits a disregarded in this analysis. (Bell-Cornell)

A STABLE ESTIMATOR FOR LINEA MODELS 1. THEORETICAL DEVELOPMEN AND MONTE CARLO EXPERIMENTS.
Pavia Univ. (Italy).

L. Natale, and E. Todini.
Water Resources Research, Vol. 12, No. 4, p 667-671, August 1976. 5 fig, 8 ref.

Descriptors: *Hydrologic systems, *Linear programming, *Estimating, Optimization, Simulation analysis, Monte Carlo method, Constraints, Hydrologic data, River basins, Networks, Drainage, Input-output analysis, Mathematical models, Systems analysis.
Identifiers: *Black box parameter estimation, Quadratic programming, Error minimization, Sensitivity.

Instant unit hydrograph (IUH) type linear models have been widely used to simulate many hydrologic systems. Unfortunately, the classical parameter estimators used to calibrate this type of model often fail to give a reliable and meaningful solution. It has been suggested that a set of constraints that can be deduced from the physics of the hydrologic system be imposed on the IUH in order to reduce the high sensitivity of the classical estimators to errors in the available data. Therefore, a mathematically correct constrained estimator has been devised, and its solution is obtained by using quadratic programming. The higher degree of efficiency of this estimator (smaller dispersion of the estimates about the true value) is shown numerically through Monte Carlo experiments. (Bell-Cornell)

HYDROLOGIC ENGINEERING METHODS FOR WATER RESOURCES DEVELOPMENT, VOLUME 3, HYDROLOGIC FREQUENCY ANALYSIS,
Hydrologic Engineering Center, Davis, Calif.
L. R. Beard, and A. J. Fredrich.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A017 433, Price codes: A08 in paper copy, A01 in microfiche. Report HEC-IHD-300, April 1975. 143 p, 38 fig, 6 tab, 33 ref.

Descriptors: *Hydrology, *Analytical techniques, *Statistical methods, Data processing, Statistics, Frequency analysis, Frequency curves, Flood frequency, Runoff, Surface runoff, Forecasting, Correlation analysis, Probability, Hydrologic data, Climatology.
Identifiers: *Hydrologic engineering.

Statistical analysis as applied in hydrologic engineering consists of (1) estimating the future frequency or probability of hydrologic events based on information contained in hydrologic records, and (2) correlating interrelated hydrologic variables. In probability analyses, statistical methods permit coordination of observed data to yield a more accurate estimate of future frequencies than is indicated by the observed data. In correlation analyses, statistical methods provide means for deriving the best relationship for predicting the value of one variable from known value of other variables. The volume described and illustrates applications of statistical analysis in hydrologic engineering. The volume included the following items: (1)A review of the basic concepts of probability that are applicable in hydrologic engineering, with a guide to supplemental reading for further study, (2)Presentation of detailed computation procedures and supporting justification and computation aids for derivation of probability or frequency estimates based on analysis of hydrologic records that have been adjusted to be consistent with selected reference base conditions, and (3)A summary of procedures for developing 'regionalized' hydrologic frequency estimates, based on analyses of hydrologic records available at stream gaging stations, adjusted to provide generalized flood-frequency relations that are considered most representative of long-period hydrologic characteristics in various drainage areas in the region. Descriptors: *Africa, *Deltas, *Land reclamation, *Wetlands, Arid lands, Environmental effects, Planning, Fisheries, Irrigation, Aquaculture, Water pollution, Monitoring.
Identifiers: *Egypt, Nile River(Egypt), Lake Manzala(Egypt).

Agriculturally productive land is probably the most important physical constraint determining Egypt's potential growth. Previous reclamation efforts have involved the desert; now the northern wetlands are being considered. Construction of the Aswan High Dam caused the water table of the Nile Delta to rise and nutrient content of the water and sardine catches to decrease. Planning responsibilities for the wetland area are fragmented, especially for the Lake Manzala area. Land reclamation might require twenty years before cultivation due to high salinity, it would destroy a major fishing ground, reduce fish spawning grounds, destroy wetland flora and fauna, affect bird migration routes, and remove avian insectivorous species. Use of the lake's water for irrigation, if salinity were reduced, would also have ecological effects. Lake Manzala now supplies 25% of Egypt's annual fish consumption. Aquaculture experiments are being conducted. Pollution is a significant factor in determining the feasibility of either fish farming or irrigation. Environmental management with an effective monitoring system is an urgent priority as large scale land reclamation is ecologically irreversible. (Buchanan-Davidson--Wisconsin)

UNITED STATES COAST PILOT 4 - ATLANTIC COAST FROM CAPE HENRY TO KEY WEST.
National Ocean Survey, Rockville, Md.
Fourteenth Edition, July 1976, 234 p, 2 fig, 21 tab, append.

Descriptors: *Navigation, *Navigable waters, *Coasts, Charts, Rivers and Harbors Act, Transportation, North Carolina, South Carolina, Georgia, Florida, Virginia, *Southeast US.
Identifiers: Intracoastal waterways, Waterways(Transportation), Navigable canals, Navigational charts, *Southeast US Coast.

The National Ocean Survey Coast Pilots are a series of eight nautical books that cover a wide variety of information important to navigators of the United States coastal and intracoastal waters. Most of this information cannot be shown graphically on the standard nautical charts and is not readily available elsewhere. Coast Pilot subjects include navigation regulations, outstanding landmarks, channel and anchorage peculiarities, dangers, weather, ice, freshets, routes, pilotage, and port facilities. The Coast Pilot is corrected through the dates of Notices to Mariners shown on the title page and should not be used without references to the Notices to Mariners issued subsequent to those dates. This volume of Coast Pilot 4, cancels the 13th (July 1975) Edition. Details are given for the following localities: Cape Henry to Key West, Cape Henry to Cape Lookout, Cape Lookout to Cape Fear, Cape Fear to Charleston Harbor, Charlston Harbor to Savannah River, Savannah River to St. Johns River, St. Johns River, St. Johns River to Miami, Miami to Key West and Intracoastal Water-way, Atlantic Section. PERFORMANCE AND EVALUATION OF COMBINED MOLE-TILE DRAIN SYSTEM IN HEAVY SOILS,
Utah State Univ., Logan.
K. Unhanand, and K. Tuamsangiem.
International Commission On Irrigation and Drainage Bulletin, p 36-52, January 1975. 24 fig, 15 ref.

Descriptors: *Drainage, *Drainage effects, *Drainage practices, *Drainage system, *Drains, Soils, Soil water, *Tide drains.

A field experiment investigated the performance and cost of the combined mole-drain systems in heavy soils in comparison with a similar tile drain system. Three experimental plots consisted of a tile-drained plot, a combined (single mole) drained plot and a combined (double mole) drained plot. They were constructed with a tile drain spacing of 37 metres (120 feet) and a mole drain spacing of 1.83 metres (6 feet). The experimental results show that the combined systems were more effective than the drain system in lowering the water table. The difference in the effectiveness of the single mole drains and double mole drains was not distinctly apparent. No deterioration of the mole drains was detected during the two year test period. The cost analysis indicated that the annual cost of the combined systems is always less than that of an equivalent tile drain system even if the mole drains in the combined system have to be redrawn every year. (Skogerboe-Colo St).

MAPPING RUNOFF-PRODUCING ZONES IN HUMID REGIONS,
McGill Univ., Montreal (Quebec). Dept. of Geography.
T. R. Moore, and C. H. Taylor.
Journal of Soil and Water Conservation, Vol. 31, No. 4, p 160-164, July-August 1976. 5 fig, 27 ref.

Descriptors: *Mapping, *Runoff, Zoning, Humid areas, Hortons law, Hydrology, Overland flow, River flow, Land management, Rainfall intensity.
Identifiers: *Runoff-producing zones, Horton infiltration approach, River discharge, Infiltration capacity, Prediction technique, Saturated areas, Soil morphology.

In undisturbed humid regions, the saturated areas of a catchment play an important role in determining storm runoff through subsurface storm flow, return flow, and direct precipitation onto saturated areas. Field mapping showed that the extent of the saturated area varies seasonally from 15 to 51%. The saturated areas also served an important function in determining stream water quality and land capability. The best method of evaluating the size, location, and variation of saturated areas was by repeated field mapping. Topography had a major influence on the distribution of the saturated area. Soil morphology was a more useful criterion. From the distribution and type of gley morphology within a soil profile, the soil water regime and water table depth could be estimated. A number of relatively simple observations indicated fairly well the distribution of saturated areas in catchments. Estimates could also be derived from soil moisture budgets of typical types and hydrograph analysis. Each method had different applicability in different types of catchments. (Roberts-ISWS)

Identifiers: *St. Lawrence River basin, Maximum discharges, Minimum discharges.

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the St. Lawrence River basin below Lake Huron. This report is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. (Woodard-USGS)

ESTIMATION AND SIMULATION OF SHEET RUNOFF,
Commonwealth Scientific and Industrial Organization, Canberra (Australia). Div. of Land Use Research.
J. R. Ive, C. W. Rose, B. H. Wall, and B. W. R. Torssell.
Australian Journal of Soil Research, Vol 14, No 2, p 129-138, June 1976. 3 fig, 2 tab, 23 ref, append.

Descriptors: *Model studies, *Surface runoff, *Water balance, *Soil moisture, Water storage, Water loss, Antecedent moisture content, Storm runoff, Pastures, Rainfall-runoff relationships, Plant growth, Australia, Estimating.

Many water use models assume that surface runoff is negligible or that it occurs only after a defined soil water storage has been filled. In areas where rainfall is characterized by high intensity storms of short duration, such as the dry monsoonal area of northern Australia, such models overestimate soil water storage. A study is reported which aimed to estimate sheet runoff in such a situation and to demonstrate its importance by evaluating the improvement achieved when a runoff function is included in a water balance routine of a simulation model. Runoff was estimated for a Townsville stylo - annual grass pasture with a 1% slope using neutron hydrometry supplemented by gravimetric soil sampling, both carefully timed with respect to the rainfall event. An empirical model relating sheet runoff to antecedent soil moisture content and the standard daily rainfall total was developed and incorporated into an existing growth model which included a water balance routine. The soil water values simulated with the runoff model included were significantly closer to experimental values than when runoff was assumed to be zero; this improvement was consistent with an improvement in subsequent dry matter simulation. Descriptors: *Streamflow forecasting, *Reservoirs, Hydrology, *Simulation analysis, *Water balance, Methodology, Model studies, Hydrologic data, Input-output analysis, Reservoir operation, *South Carolina, *Reservoir operations.
Identifiers: *Lakes Marion-Moultrie reservoir(SC).

A stream-reservoir model was developed to simulate the operation of the Lakes Marion-Moultrie, South Carolina, reservoir system. The reservoir system is operated under the assumption of a 3-day prior knowledge of inflows. This information is attainable from the ooperational reservoir-inflow forecasting model developed in the Part I report. The model, developed for this part of the study, incorporates an inflow component, a diversion-canal component, and a reservoir system component and is capable of evaluating the performance of the reservoir systemem for a variety of operating rule conditions. All model components were verified using observed reservoir input and output data for a 6-year (1967-72 water years) period. In addition, a long-term 31-year simulation under present rule of operation was performed and the results summarized statistically. The model may be used for simulating other rule curves of operation for planning studies of reservoir system performance. (See also W75-05646) (Woodard-USGS)

THE BROADLEAF EVERGREEN FORESTS OF JAPAN, (IN GERMAN),
T. Suzuki.
Phytocoenologia. 2(3/4), p 293-300, 1975.

Descriptors: *Asia, *forests, Rain forests, Forest management.
Identifiers: *Broadleaf evergreen forests, *Evergreen forests, Fern, Ficus-retusa, Ficus-wightiana, *Japan, Liana, Machilus-thunbergii, Quercus-phillyraeoides, *Lawraceae, *Fagaceae.

Rainy climate continues from the subtropics northward to the cool-temperate region in Japan. The broad-leaved evergreen forests of Japan have many characteristics of the rain-forest, such as richness in lianas, epiphytes and ferns. The dominant genera, within which evergreen and deciduous species have differentiated during the climatic alternations since the Tertiary, are for the most endemic or have specified endemic taxa in Sino-Japanese Region. It is a unique character of this east Asiatic and southeast Asiatic broad-leaved evergreen forest that the Lauraceae and the Fagaceae grow in a community. Because the route of migration was 1 way, along the axis of the Archipelago, this class-group is monotypic with only 1 class, 1 order and 1 alliance. The alliance of Shiion sieboldii is the only one of the class-group that has reached the seashore. Shiion sieboldii comprises 4 suballiances. Suballiance of Quercion phylliraeoides is physiognomically a sclerophyllous forest, but it is floristically a suballiance of the Shiion sieboldii. Quercus phillyraeoides itself is a relict of the Tertiary warm zerophytic flora. In this suballiance the Lauraceae are separated from the Fagaceae. The typical suballiance has no clear character species for itself, but is the main part of the alliance. It is composed of 5 associations. Cyclobalanopsion stenophyllae develops near the upper limit of the alliance. It has 3 associations, among which the Aucubo-cyclobalapsetum stenophyllae is the only one differentiated under the snowy climate of the Japan sea coast. The last Machilion thunbergii is hygrophilous and shade-tolerant. In the south it is the most therm ophilous of the all suballiances; it forms subtropical stand near the boundary to the Ficus wightiana and F. retusa forests, but it is the suballiance that can attain the northernmost limit of the alliance, because Machilus thunbergii can utilized more efficiently the lateral light from the lower position of the sun and refraction from the sea surface.—Copuright 1976, Biological Abstracts, Inc.

HYDROGEOLOGIC DATA FROM THE GREAT BEND PRAIRIE, SOUTH-CENTRAL KANSAS,
Geological Survey, Lawrence, Kans.
L. E. Stullken, and S. W. Fader.
Kansas Geological Survey, Lawrence, Basic-Data Series Ground-Water Release No 5, 1974. 50 p, 1 fig, 1 plate, 4 tab.

Descriptors: *Hydrologic data, *Groundwater resources, *Water quality, *Aquifer characteristics, *Well data, Hydrogeology, Water supply, Water yield, Water levels, Water users, Lithologic logs, Chemical analysis, Great Plains.
Identifiers: *Great Bend Prairie(Kans).

The investigation of the geology and ground-water resources of the Great Bend Prairie, an area of 5,400 square miles which includes all of Kingman, Kiowa, Pratt, Stafford, and parts of Barber, Barton, Edwards, Pawnee Reno, and Rice Counties, south-cental Kansas, was made during 1973-74. The study is part of the cooperative program between the Kansas Geological Survey and the U.S. Geological Survey, with data and support from the Division of Water Resources of the Kansas State Board of Agriculture and the Division of Environment of the Kansas State Board of Health and Environment. Records of 1,508 wells in the ten counties are presented. Included are 1,234 irrigation, 25 domestic or stock, 172 industrial or public supply, and 77 other wells. One hundred fifty-two chemical analyses of water from 148 representative wells are listed. Lithologic logs of 127 test holes also are included. (Woodard-USGS)

GROUND-WATER LEVELS IN THE UNITED STATES, 1970-74: SOUTH-CENTRAL STATES.
Geological Survey, Reston, Va.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington, Va., 22202, price $2.50. Water-Supply Paper 2172, 1976. 172 p, 5 fig.

Descriptors: *Water leve's, *Groundwater, *Arkansas, *Louisiana, *Oklahoma, *Texas, Basic data collections, Water wells, Observation wells.
Identifiers: *South-central states.

Water-level measurements in this report of south-central states, for 1970-74, are given in feet with reference to either mean sea level or land-surface datum. Mean sea level is the datum plane on which the national network of precise levels is based; land-surface datum is a datum plane that is approximately at land surface at each well. If known, the altitude of the land-surface datum above mean sea level is given in the well description. The height of the measuring point above or below land-surface datum is given in each well description. Water levels in wells equipped with recording gages are reported for every fifth day and the end of each month. (Woodard-USGS)

EFFECTS OF NEAR-WELL PERMEABILITY VARIATION ON WELL PERFORMANCE,
New South Wales Univ., Kensington (Australia). Water Research Lab.
C. R. Dudgeon, and P. S. Huyakorn.
Australian Water Resources Council, Canberra, Technical Paper No. 18, 1976. 132 p, 52 fig, 23 ref, 4 append.

Descriptors: *Water wells, *Water yield, *Aquifers, *Permeability, Groundwater movement, Specific capacity, Drawdown, Pumping.

Field evidence has shown that the specific capacity of a pumped well can be greatly affected by permeability variations which occur in a zone immediately surrounding the well: for instance, by the invasion of drilling fluids to form a mud cake. A theoretical investigation is reported into the effect of such a phenomenon on the production capacity and drawdown of fully and partially penetrating wells which are screened in a confined aquifer. A method is presented for determining the average coefficient of permeability in the affected zone and the radial extent of the zone. Numerical solutions of several transient and steady flow cases were obtained using finite element analysis.

The results are presented in graphical form which enables a parametric study of dimenionless relationships to be conducted readily. Detailed tabulations of the results are given in appendices. (CSIRO)

GROUND-WATER DISCHARGE FROM THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1975,
Geological Survey, Austin, Tex.
R. A. Rappmund.
Edwards Underground Water District, San Antonio, Texas, Bulletin 35, July 1976. 7 p, 1 tab, 15 ref.

Descriptors: *Water yield, *Groundwater, *Limestones, *Aquifers, *Texas, *Water wells, *Springs, Data collections, Discharge(Water), Fluctuations, Annual.
Identifiers: *San Antonio area(Tex), *Edwards limestone(Tex).

The estimated total discharge from wells and springs in the Edwards and associated limestones in the San Antonio area, Texas, during 1975 was 868,200 acre-feet, which is the record high for the period 1934-75. The total discharge from wells and springs in 1975 was about 2 percent more than in 1974 and about 55 percent more than the average for 1934-74. About 38 percent of the total discharge was from wells, and approximately two-thirds of this amount was from wells in Bexar County. The discharge from wells in 1975 was 10 percent less than in 1974; springflow increased by about 12 percent. The discharge from springs was compiled from reports of gages operated by the U.S. Geological Survey at points of discharge. Pumpage for agriculture was estimated from records of power consumption and irrigated acreage. Records of the annual canvass of pumpage in the San Antonio area by the Texas Water Development Board were used to compile municipal, military and industrial usage. (Woodard-USGS)

DIGITAL SIMULATION OF A BASALT AQUIFER SYSTEM, WALLA WALLA RIVER BASIN, WASHINGTON AND OREGON,
Geological Survey, Tacoma, Wash.
R. D. Mac Nish, and R. A. Barker.
Washington Department of Ecology, Olympia, Water-Supply Bulletin 44, 1976. 51 p, 19 fig, 1 plate, 3 tab, 14 ref.

Descriptors: *Model studies, *Aquifer systems, *Aquifer characteristics, *Pumping, Washington, Oregon, Water yield, *Water demand, Water utilization, Water levels, Transmissivity, Hydrogeology, Projections, Evaluation, Mathematical models, Computer models, River basins, *Simulation analysis, Groundwater.
Identifiers: *Walla Walla River basin(Wash-Oreg).

A digital (mathematical) model utilizing an alternating-direction implicit procedure simulates the hydraulic response to 72 years of pumping stress of a basalt aquifer system underlying the 1,758-square-mile Walla Walla River basin in Washington and Oregon. The modeled aquifer system is sandwiched between an underlying basalt-aquifer zone and an overlying aquifer zone composed of gravel and clay in the central lowland part of the basin and of basalt elsewhere. A water budget of the aquifer system before pumping stress began in about 1900 was computed by steady-state simulation. For this simulation the aquifer received 132,000 acre-feet of water per year, with 114,000 acre-feet entering from the principal recharge area, the Blue Mountains, on the southeastern border of the basin. Annual discharge rates were 97,500 acre-feet laterally to the Snake and Columbia Rivers and 34,500 acre-feet to adjacent aquifers, which also eventually drain to the two rivers. By 1945 pumping stress had reached about 5,000 acre-feet per year. A large increase in irrigation demand over the next 20 years increased the pumpage to 20,000 acre-feet per year and caused declines of as much as 135 feet from the 1900 water levels. Simulation of the effects of pumping indicated that by 1972 the water budget of the basalt aquifer system showed a net increase of flow from the recharge areas (6,500 acre-feet per year) and reduction in both lateral outflow (8,500 acre-feet per year) and discharge to adjacent aquifers (12,500 acre-feet per year). (Woodard-USGS)
W77-00481

DIGITAL-MODEL ANALYSIS TO PREDICT WATER LEVELS IN A WELL FIELD NEAR COLUMBUS, INDIANA,
Geological Survey, Indianapolis, Ind.
M. Planter.
Available from National Technical Information Service, Springfield, VA 22161 as PB-255 909/As, Price codes: A02 in paper copy, A01 in microfiche. Water-Resources Investigations 76-63, May 1976. 15 p, 7 fig, 1 tab, 4 ref.

Descriptors: *Model studies, *Water levels, *Projections, *Aquifer characteristics, *Groundwater resources, *Indiana, Digital computers, Water supply, Water demand, Drawdown, Well resources, *Indiana, Digital computers, Water supply, Water demand, Drawdown, Well spacing, Water table aquifers, Groundwater barriers, Hydrologic data, Hydrogeology.
Identifiers: Columbus area(Ind).

Columbus, Indiana, obtains its water supply from six municipally owned wells southwest of the city. The wells are screened in an outwash sand and gravel aquifer that was deposited by glacial melt water in a preglacial bedrock valley. The well field is midway between the East Fork White River and the western edge of the valley. A digital model was used to determine the effects of two pumping plans on the outwash sand and gravel aquifer. In pumping plan 1, a continuous pumping rate of 1,400 gallons per minute (gpm) for 10 years in each of the city's six existing wells was simulated with the model. Model results of plan 1 indicate that the water levels in the area of the well field would be lowered more than 20 ft and that drawdowns in the wells would approach 35 ft after 10 years' pumping. Pumping plan 2 had two stages of pumping. In the first, a continuous pumping rate of 1,400 gpm for 5 years in each of the city's six existing wells was simulated with the model; the second stage of pumping plan 2 differed from stage 1 only in that five planned wells were added to the six existing wells. Model results of plan 2 indicate that water levels in the area of the well field would be lowered as much as 40 feet. Drawdown at two of the well sites would approach 60 ft, leaving less than 15 ft of the initial 70 ft of saturated thickness at the two wells after 10 years' pumping. (Woodard-USGS)

CHANGES IN THE WATER SUPPLY IN THE UPPER REPUBLICAN NATURAL RESOURCES DISTRICT, SOUTHWEST NEBRASKA, FROM 1952-75,
Geological Survey, Lincoln, Nebr.
E. G. Lappala.
Open-file report 76-498, July 1976. 17 p, 4 fig, 1 tab, 4 ref.

Descriptors: *Groundwater resources, *Irrigation effects, *Drawdown, *Water levels, *Nebraska, Water supply, Water demand, Hydrologic data, Surface-groundwater relationships, Aquifer characteristics, Pumping, Groundwater recharge, *Water districts.
Identifiers: Southwest Nebraska, *Upper Republican Natural Resources Dist(Neb).

Use of ground water for irrigation has increased rapidly in the Upper Republican Natural Resources District in southwestern Nebraska in recent years. The principal aquifer being developed is composed of saturated and gravel of the Ogallala Formation of Tertiary age. Water-level declines of as much as 16 feet (4.9 meters) have occured. Base flow of major streams draining the aquifer was reduced by as much as 19 percent between 1967 and 1975. Recoverable ground water in storage was reduced by about 1 percent. New withdrawal of ground water in 1975 was about 250,000 acre-feet (308 million cubic meters), compared with estimated recharge from precipitation of 176,000 acre-feet (217 million cubic meters). Water levels and streamflow will continue to decline if ground-water withdrawals continue at or greater than the 1975. (Woodard-USGS)

FLOODFLOW CHARACTERISTICS AT PROPOSED BRIDGE SITE ON FISHKILL CREEK, FISHKILL, NEW YORK,
Geological Survey, Albany, N.Y.
T. J. Zembrzuski, Jr., and B. Dunn.
Open-file report 76-595, August 1976. 8 p, 3 fig, 3 tab, 5 ref.

Descriptors: *Flood flow, *Bridge design, *Backwater, *Flood recurrence interval, *Flood discharge, Engineering structures, Bridge construction, Hydrologic data, Evaluation, Planning, New York, Flood frequency, Flood profiles.
Identifiers: *Fishkill Creek(NY).

An evaluation of floodflow characteristics of Fishkill Creek at the proposed bridge site at Fishkill, N.Y., was made for the 50- and 100-year floods. The flood-frequency analysis revealed that the magnitude of the 50- and 100-year floods are 8,000 cubic feet per second (cfs) and 10,000 cfs, respectively. The normal water-surface elevation at the approach cross section was determined by the slope-conveyance method to be 209.8 feet during a 50-year flood and 210.8 feet during a 100-year flood. Also included is an analysis of the effect of the existing bridge and of two alternative bridge designs on the profiles of floods having recurrence intervals of 50 and 100 years. (Woodard-USGS)

AN OVERVIEW OF URBAN SEDIMENTOLOGY,
Geological Survey, Reston, Va.
H. P. Guy.
In: National Symposium on Urban Rainfall and Runoff and Sediment Control: Proceedings of Symposium held July 29-31, 1974, Lexington, Kentucky. Report UKY BU106, Kentucky University, Office of Research and Engineering Services, p 149-159, October 1974. 8 fig, 15 ref.

Descriptors: *Sediment transport, *Urbanization, *Storm runoff, *Construction, *Soil erosion, Channel erosion, Erosion control, Methodology, Urban hydrology, Sedimentology, Sediment yield, Runoff.

Urban sedimentology implies all theoretical, scientific, analytical, and philosophical studies of particulate matter moved, or likely to be moved, by water, wind, ice, gravity, or man in an existing or developing urban area. More commonly, however, urban sedimentology is concerned with (1) spatial and temporal erosion of soils in construction areas, (2) the nature of the movement and impact of sediments in construction areas and in water bodies downstream, (3) methods for mitigating erosion and sediment movement, and (4) channel erosion downstream where flows have increased as a result of increased imperviousness from urbanization. Minimizing sediment problems in an urban development area begins with sound land use and structure design, then makes use of practical vegetative controls on as much of the site as possible, for as much time as possible to prevent erosion and trap sediment; and then makes use of physical controls to slow runoff and trap sediment. Such controls must be applied with specific criteria as to their needs and effectiveness; that is, the reduction in damages must exceed the cost of application. (See also W76-09729) (Woodard-USGS)

TRI-STATE CONFERENCE REPORT: METHODS FOR BEACH AND SAND DUNE PROTECTION,
Georgia Dept. of Natural Resources, Atlanta.
In: 'Methods for Beach and Sand Dune Protection', March 31-April 2, 1974, Jekyll Island, Ga. 48 p, 6 fig.

Descriptors: *Erosion control, *Shore protection, *Beaches, *Dunes, Sands, Georgia, North Carolina, South Carolina, Conferences, Barrier islands, Stability, Methodology, Seashores, Governmental interrelations, Vegetation, Barriers, Costs, Land use, Legislation, Social participation, Planning, *Southeast US.

A conference of representatives from Georgia and North and South Carolina, discussed the importance of the natural beach and sand dune system; typical features of a Georgia barrier island; role of dunes in shoreline stability; energy of the tide and its effect on the coastal zone; critical areas in the shore zone of some Georgia islands; ecological consequences of barrier island migration and management in North Carolina; and coastal processes at Tybee Island, Georgia (an eroding barrier island); stabilizing of coastal dunes; beach erosion control in South Carolina; beach stabilization with experimental nylon bag groins; role of a local citizen commission in dune protection; inter-governmental cooperation for dune protection at Savannah Beach, Georgia; federal interest in beach and dune protection; role of citizens in sand dune protection; criteria for successful beach erosion control projects; and intergovernmental cooperation for beach and sand dune protection. It was pointed out that beaches and sand dunes are fragile systems requiring careful management and must be understood to be controlled. Too often costs and benefits have not been measured before undertaking projects. Protection is the joint responsibility of local, state, and federal governments, in which citizens have an important role to play. (Buchanan-Davidson-Wisconsin).

STUDY OF THE EROSION STABILITY OF THE PLOW LAYERS OF GRAY FOREST SOILS OF THE NORTHERN FOREST-STEPPE, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Physics and Reclamation.

M. S. Kuznetsov, V. Ya. Grigor'ev, E. G. Aleksandrova, and G. P. Glazunov.
Biol Nauki. 18(2), p 122-126, 1975.

Descriptors: *Forest soils, Gray-Brow podzolic soils, *Analytical techniques, Mathematical studies, *Erosion, Slope stability, *Erosion control, Grasslands.
Identifiers: Steppes, USSR.

The erosion stability of the gray forest soils of the right-bank region of the Oka River, USSR, which are subjected to intense processes of slope erosion was evaluated by means of the values of the permissible (noneroding) water-flow velocities, i.e., the flow velocities at the height of the projections of the channel bed not causing erosion. An equation is derived for calculating the permissible flow velocities. The data obtained can be used for forecasting slope erosion and for developing antierosion measures.—Copyright 1975, Biological Abstracts, Inc.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

CHARACTERISTICS OF RURAL HOUSEHOLD WASTEWATER,
Wisconsin Univ., Madison. Small Scale Waste Management Project.
R. Siegrist, M. Witt, and W. C. Boyle.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE3, p 533-548, June, 1976. 3 fig, 17 tab, 15 ref.

Descriptors: *Domestic water, *Domestic wastes, *On-site investigations, Water requirements, Biochemical oxygen demand, Suspended solids, Nitrogen compounds, Phosphorus compounds, Microorganisms, Disinfection, Water reuse, *Pollutant identification.

Water use was monitored at 11 rural homes for about a month and waste water quality was monitored at three of the residences. Water usage yielded an average flow of 42.6 gallons/capita/day. Laundry, bath/shower, toilet flushings, dishwashing, water softener use, and other events accounted for the following percentages of water use: 24.7%, 23.5%, 21.5%, 11.4%, 6.2%, and 12.7%, respectively. The average daily contributions of biochemical oxygen demand, suspended solids, total nitrogen, and total phosphorus were 0.109, 0.77, 0.013, and 0.009 pounds of pollutant/capita/day, respectively. Bacteriological analyses indicated wide variation in indicator organisms and the possibility of pathogenic organisms in bath and laundry waste waters. Therefore, disinfection of these prior to reuse is recommended. (Kreager-FIRL)

BIOASSAY PROCEDURES FOR THE OCEAN DISPOSAL PERMIT PROGRAM,
Environmental Protection Agency, Gulf Breeze, Fla. Environmental Research Lab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 209, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/9-76-010, May, 1976. 106 p, 9 fig, 12 tab, 87 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Bioassay, *Oysters, *Algae, Marine fish, Crustaceans, Brine shrimp, Waste disposal, Toxicity.
Identifiers: *Ocean Disposal Permit Program(EPA).

Bioassay procedures are given which were developed to provide tests for conducting toxicity evaluations of waste materials considered for ocean disposal under the Environmental Protection Agency's (EPA) Ocean Disposal Permit Program. Three of the nine bioassay procedures described, the oyster shell growth procedure, the chronic fish egg-to-egg procedure, and the acetylcholinesterase inhibition test, are not recommended for routine use. At least three species from different taxonomic groups and representing several trophic levels should be used in evaluating a dumping permit. The procedures include both flow-through and static tests. The methods vary in their utility and complexity of performance. The procedures are not intended to be 'standard methods' but as guides for those involved in evaluating ocean dumping permits. (Snyder-FIRL)

ASSOCIATIONS OF CHLORINATED HYDROCARBONS WITH FINE PARTICLES AND HUMIC SUBSTANCES IN NEARSHORE SURFICIAL SEDIMENTS,
University of Southern California, Los Angeles. Environmental Engineering Program.
W. W. Choi, and K. Y. Chen.
Environmental Science and Technology, Vol. 10, No. 8, p 782-786, August 1976. 6 fig, 4 tab, 34 ref. Army DACW39-74-C-0077.

Descriptors: *Chlorinated hydrocarbon pesticides, *Sediments, *Pollutant identification, Sampling, Laboratory tests, Pesticides, Organic pesticides, Organic compounds, DDE, DDD, DDT, Polychlorinated biphenyls, Aroclors, Particle size, Humus, Fulvic acids, Pollutants, Water pollution, Harbors, Sewage effluents, Outfall sewers.

Sediment samples from Los Angeles Harbor along the Terminal Island sewer outfall to the breakwater entrance were collected. Upon extrusion from cores, these sediment samples were sealed in plastic bags and stored in ice at 4 C for transport to the laboratory, where the well-mixed subsamples were transferred into an airtight plastic container in a glove bag under a nitrogen atmosphere. The samples were stored in a refrigeration unit at approximately 4 C until used. The homogenized sediment from each station was split into three fractions to be extracted and/or analyzed for humic and fulvic acids, chlorinated hydrocarbons, and particle size. It was found that: p,p'DDE generally accounts for 60-70% of the total chlorinated hydrocarbon content in sediment, whereas PCB's (mostly Arochlor 1254) constitute almost 10-20% of the total. Other isomers of DDT and dieldrin account for the remaining fraction. Concentrations of chlorinated hydrocarbons are closely related to the organic contents and to particles of 8 micrometers or less in size. Total organic carbons of sediments as well as fulvic and humic acid fractions bear a linear relationship with respect to concentrations of chlorinated hydrocarbons in sediments. Total chlorinated hydrocarbon contents of sediments studied range from 0.3 to 3.5 ppm, whereas total organic carbon contents range from 0.45 to 1.70% on a dry weight basis. (Sims-ISWS)

URBAN WATERSHED MANAGEMENT USING ACTIVITY INDICATORS TO PREDICT WATER QUALITY,
Carnegie-Mellon Univ., Pittsburgh, Pa. Environmental Studies Inst.
W. P. Darby, F. C. McMichael, and R. W. Dunlap.
Water Resources Research, Vol. 12, No. 2, p. 245-252. April 1976. 1 fig, 18 ref, 6 tab.

Descriptors: *Water quality, *Water quality control, *Water management(Applied), *Watersheds(Basins), *Indicators, Land use, Urbanization, Waste disposal, Cities, *Pollutant identification.
Identifiers: Federal Water Pollution Control Act of 1972, Discriminant analysis technique, Activity indicators, Stream potential.

The 1972 Federal Water Pollution Control Act amendments (public law 92-500) established water quality goals and proposed methodology appropriate for major rivers. The role of small urban watersheds which drain into a small stream which eventually joins a large urban river was studied using fifty-two small watersheds in Allegheny County (PA). Three data bases were sought: stream sampling data, perceived water quality data and watershed data. Stream sampling data included pH, dissolved oxygen, total coliform, tota

dissolved solids, total iron and temperature. Experts were asked to analyze water quality by perception, rating streams on a scale of 1 to 5 from poor to excellent quality. Sixteen indicators were used to predict actual stream qualty for watersheds for which no direct stream quality measures exist. The 16 indicators were subdivisions of 7 principal activities, including municipal waste disposal, solid waste disposal, urbanization, acid mine drainage, industrial waste disposal, siltation and stream potential. The discriminant analysis technique was employed to relate activity indicators to actual water quality. The concept of activity indicators is valuable when data are sparse, disaggregate or discontinuous in nature, or when an agency does not have the funds for extensive monitoring programs. With limited sampling data, indicators of watershed characteristics may be used to estimate overall water quality of a stream and predict individual problem parameters. Local authorities may therefore participate more fully in management of small urban watersheds. (Gentry-North Carolina)

Descriptors: Indexing, Documentation, *Data processing, *Water quality, *Benthic communities, Methodology, Testing procedures, Habitats, Sampling, Effluent, Bioassay, *Pollutant identification.
Identifiers: *Trent biotic index, *Chandler's score system, *Kothe's species deficit, *Graham's biotic index, *Community diversity index, *Benthic macro-invertebrates, North Esk River(Scotland), Ivel River(England), Taf River(Wales), Riffle habitat.

Data processing methods are compared and evaluated. Individual biological surveys were carried out on 3 British rivers: North Esk, Ivel and Taf. Benthic communities were used as an index or summary indicator reflecting ecological conditions caused by effluent discharge. Parameters varied between rivers, but included: temperature, pH, specific conductance, dissolved oxygen (DO), biological oxygen demand (BOD), nitrite, nitrate, total hardness, alkalinity, chloride, phosphate, sulphate, velocity of water flow and nature of substream, among others. Benthic macro-invertebrates were chosen as most suitable organisms for assessing water quality. The riffle habitat was chosen for collection of samples because of the large number of microhabitats and presence of most macro-invertebrate species sensitive to water quality deterioration. Two sampling techniques were used: the heel-kick and stop net method, and a cylindrical core sampler (modification of the Neill design) to test the substratum. Data were collected into several numerical indexes and then compared to assess their value as criteria of water quality. The indexes were: the Trent biotic index, Graham's biotic index, the Community diversity index, Chandler's score system and Kothe's species deficit. The physical-chemical results in all 3 rivers were that sewage effluent produced elevated concentrations of nitrate, nitrite, ammonia, synthetic detergents, SS, BOD and reduced DO concentrations. The biological analysis compared sensitivity to changes in water quality, effect of sampling habitat and other factors concluding that the Chandler's score system was most appropriate as a water quality index. CARCINOGENIC NITROSAMINES AND THEIR PRECURSORS IN FRESH AND POLLUTED WATERS,
Cornell Univ Agricultural Experiment Station, Ithaca, N. Y. Dept. of Agronomy.
M. Alexander.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 778, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 1976. 24 p, 15 tab. OWRT A-055-NY(1). 14-31-0001-5032, 14-34-0001-6033.

Descriptors: *Pollutant identification, Methodology, Analytical techniques, *Gas chromatography, Separation techniques,
Identifiers: *Nitrosamines, Dialkylnitrosamines, Carcinogens, Nitroso compounds, *Amines.

A series of methods was developed and tested for the analysis of nitrosamines that might be present in natural water. Initially, the recovery of added nitrosamine in distilled water was quite poor. In sewage amended with nitrosamines, recovery of dimethyl and diethylnitrosamines was low although recovery of two other nitrosamines was greater than 75%. Using an Amberlite resin, the recovery of nitrosamines added to lake water ranged from 24 to 53% for diethylnitrosamine and from 65 to 97% for other nitrosamines. Recoveries of diethylnitrosamine with Amberlite were higher when this carcinogen was added to sewage. However, when nitrosamines in water were trapped on activated carbon, the nitrosamine recovery ranged from 89 to 116%, regardless of the nitrosamine tested. Recovery of these compounds by steam distillation was not as high. A method was finally devised which permitted recovery of nitrosamines from water containing parts per billion levels. In these investigations, gas chromatographic techniques were employed for detection.

REMOTE DETECTION OF WATER POLLUTANTS BY COMPUTERIZED LASER-RAMAN SPECTROSCOPY,
Rhode Island Univ., Kingston. Dept. of Chemistry.
C. W. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 777, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, (1976). 29 p, 10 fig, 3 tab, 7 ref. OWRT A-054-RI(1).

Descriptors: *Pollutant identification, *Spectroscopy, Water pollution, Chemicals, *Remote sensing, Data processing.
Identifiers: *Laser raman spectroscopy, *Hazardous chemicals.

Hazardous chemicals in water have been analyzed remotely and by conventional instrumentation using a digitized Raman spectrometer. Several data processing methods were explored in order to lower the level of detectability. Furthermore, the feasibility of using the resonance Raman effect to lower the level of detectability was investigated. It is possible to detect many hazardous chemicals in the 1-10 ppm range using either data processing or the resonance Raman effect.

ISOLATION AND IDENTIFICATION OF BLUE-GREEN ALGAE PRODUCING MUDDY ODOR METABOLITES, GEOSMIN, AND 2-METHYLISOBORNEOL, IN SALINE LAKES IN MANOTOBA,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. L. Tabachek, and M. Yurkowski.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 1, p. 25-35, 1976. 7 fig., 1 tab., 56 ref.

Descriptors: *Odor-producing algae, *Cyanophyta, *Saline lakes, Water pollution sources, *Canada, Fish, *Pollutant identification.
Identifiers: *Geosmin, Methylisoborneol, Manitoba(Canada), Oscillatoria, Lyngbia, Symploca muscorum, Muddy odor, Lacquer odor.

Rainbow trout farmed in the saline lakes of southwestern Manitoba developed a muddy flavor which was attributed to geosmin and/or 2-methylisoborneol produced by blue-green algae. The algae producing geosmin were Oscillatoria cf. prolifica, 0. tenuis, 0. cf. cortiana, 0. cf. variabilis, 0. agardhii, 0. splendida, 0. sp. Symploca cf. muscorum, Lyngbya cf. aestuarri, and L. sp. Lyngbya cf. cryptovaginata, the latter the first alga reported to produce 2-methylisoborneol, an odor resembling lacquer. Actinomycetes or other bactria were not detected in these lakes. It was found that 0. splendida, 0. prolifica, 0. cortiana, and Lyngbya aestuarri produced the most geosmin--approximately four times more than 0. tenuis and Symploca muscorum, 20 times more than 0. agardhii, and 50 times more than 0. variabilis. Indentifical growth, extraction, and gas chromatographic analytical conditions were used. The algae that produce geosmin may grow throughout all of part of the year; certain Ocillatoria and Lyngbya species tend to occur in higher numbers or even become dominant in polluted, high organic content, or fertilized water. Previous reports of planktonic blooms of 0. prolifica and 0. agardhii have shown to produce geosmin. Sediment blooms of 0. limosa, 0. princeps, 0. splendida, and 0. tenuis have also been reported as odor producers. (Auen-Wisconsin).

DEPOSITION OF AIRBORNE MERCURY FROM SIX SWEDISH CHLOR-ALKALI PLANTS SURVEYED BY MOSS ANALYSIS,
Swedish Water and Air Pollution Research Lab., Goteborg.
T. Wallin.
Environmental Pollution, Vol. 10, p. 101-114, 1976. 8 fig., 2 tab., 11 ref.

Descriptors: *Mercury, *Air pollution, *Industrial wastes, *Analytical techniques, *Mosses, Fallout, Spatial distribution, Europe, *Pollutant identification, Path of pollutants.
Identifiers: *Sweden, Hypnum cupressiforme, Chlor-alkali industry.

Local contamination by airborne mercury from six Swedish chlor-alkali plants was studied by analyzing mercury accumulated in moss. Samples of the carpet-forming moss, Hypnum cupressiforme, were collected from a 15 km radius around each plant and the dry moss mercury contents were measured by neutron activation analysis. The highest mercury levels were found near the plants. As distance from the plants increased. Between 9-15 km from the plants, the background mercury level of the area was reached. Annual fall-out esti-

mates indicated that only a minor part of emitted mercury was deposited locally. The mercury was spread over very large areas and probably contributed to global circulation and regional background deposition. These results confirmed those obtained by the snow-sampling method. The moss-sampling method indicated that a larger area was affected by mercury deposition and that local fall-out was a larger fraction of the total emission volume, perhaps due to seasonal variations in mercury transport and fluctuations in emission due to temperature. Moss analysis can be used to survey local mercury contamination from the atmosphere, but the method needs improvement. (Buchanan-Davidson–Wisconsin)

LOS ANGELES HARBOR FIELD INVESTIGATION OF OIL AND BACKGROUND LUMINESCENCE SIGNATURES,
McDonnell Douglas Astronautics Co., Huntington Beach, Calif.
H. G. Gross.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-016 466, Price codes: A06 in paper copy, A01 in microfiche. U.S. Coast Guard Final Report No. USCG-D-154-75, May 1975. 118 p, 42 fig, 11 tab, 17 ref. DOT-CG-51998-A.

Descriptors: *Oil pollution, *Water pollution sources, *Aromatic compounds, *Remote sensing, *Resources development, California, Harbors, Continental Shelf, Gas chromatography, Mass spectrometry, Reflectance, Ultraviolet radiation, Pollutant identification.
Identifiers: *Outer Continental Shelf, Grease, Luminescence, Sky scattered daylight, Signatures, Lasers.

The USCG Program was intended to provide a first look at the possible background signatures, their relevance to site water constituents, and their possible interference with oil signatures when using a remote sensing laser fluorosensor system in an actual harbor. Specifically, the USCG Program was to obtain, by remote sensing from a ground based laser fluorosensor system, laser induced luminescence signatures of the seawater at the one channel and five harbor sites. The signatures are similar, indicating dominance by one or more common constituents. The peak at about 4500A and shape of the signature suggest dominance by heavier aromatics, probably by oil and grease, among the principal pollutants. Gas chromatograph-mass spectrometer analyses of site samples show light and heavy constituents, some of which are aromatics. Luminescence signatures of light, medium and heavy oils were established as measurable against the strong water luminescence background. Reflectance signatures of oil films on water indicate a luminescent component due to sky scattered daylight and direct sun UV irradiation. Multispectral photography provided a few examples of site supportive information. (Sinha-OEIS)

THE USE OF ERTS-1 TO MORE FULLY UTILIZE AND APPLY MARINE STATION DATA TO THE STUDY AND PRODUCTIVITY ALONG THE EASTERN SHELF WATERS OF THE UNITED STATES,
Old Dominion Univ. Research Foundation, Norfolk, Va.
H. G. Marshall, D. E. Bowker, and W. G. Witte.
Available from the National Technical Information Service, Springfield, VA 22161 as N-76-18588, Price codes: A03 in paper copy, A01 in microficche. Old Dominion University Research Foundation Final Report prepared for Goddard Space Flight Center, February 1976. 49 p, 10 fig, 15 tab, 6 ref. NAS5-21816.

Descriptors: *Chlorophyll, *Phytoplankton, *Remote sensing, *Sediments, *Suspended solids, *Oceanographic data, *Monitoring, *Productivity, Continental Shelf, Satellites(Artificial), Temperature, Salinity.
Identifiers: *Outer Continental Shelf, *Sea truth data, *Pelagic areas, U.S. East Coast, Chesapeake Bay, Radiance, Nearshore waters, Western North Atlantic Ocean, ERTS-1.

Sea truth data was obtained during two ERTS overpasses in waters near the entrance of the Chesapeake Bay. Correlations were made between total phytoplankton and chlorophyll values in these waters to radiance detected by ERTS in an effort to map areas of similar productivity levels. Band 4 radiance had the highest correlation to all parameters with bands 5 and 6 showing decreasing correlations in each case. The radiance values were apparently influenced by one or more factors, most likely including the sediment content of the water. The data have shown that ERTS MSS is not suitable for monitoring chlorophyll in nearshore waters where sediment loads are high. It is suggested that in more seaward or pelagic locations, that ERTS MSS would be more efficient in monitoring surface chlorophyll values and establishing direct relationships to phytoplankton concentrations. TAGGING OIL-RESIDUES IN TANKERS WITH MICROPARTICLES,
Swedish Investigation Committee for Methods of Tagging Oil in Ships, Stockholm.
P. O. Agnedal.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 87-90, 1 tab, 1 ref.

Descriptors: *Monitoring, *Oil pollution, *Oil spills, *Pollution abatement, Tagging, Transportation, Water quality control, *Pollutant identification.
Identifiers: *Detection, Tankers, Residues, Microparticles, Sweden, Baltic Sea.

The increase in pollution by oil spills in the Baltic has led to the Minister of Transport to set up a committee with the task to find methods for identifying ships responsible for oil spills. A preliminary study of the oil transport situation in Sweden had shown that the fingerprint method for identification will be difficult to use. The study also showed that microparticles of plastic and metal as tags might be used. In most cases the oil spills in the Baltic are due to pumping out residues mixed with ballast. In this paper the merits of different methods for tagging these residues, including the cost aspect, are treated as well as identification of recovered oil samples. In a field experiment the oil residues in a tanker were tagged. Some of its tanks were tagged with plastic particles and some with metal particles. The tanks were treated in different ways for cleaning and the oil-water mixtures were then pumped out in the sea under controlled conditions. The different spills were kept inside an enclosure for a fortnight and samples were taken every day. In all analysed samples the tagged substance could be recovered and identified. THE DEVELOPMENT OF AN EXPERIMENTAL AIRBORNE LASER OIL SPILL REMOTE SENSING SYSTEM,
Transportation Systems Center, Cambridge, Mass.
J. F. Fantasia, and H. C. Ingrao.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 101-115, 19 fig, 1 tab, 17 ref. append.

Descriptors: *Remote sensing, *Oil spills, *Oil pollution, *Pollution abatement, Water pollution, Fluorescence, Laboratory tests, Optics, Sea water, Equipment, Instrumentation, Monitoring, Resources, Pollutant identification.
Identifiers: *Outer Continental Shelf, Airborne lasers.

An experimental airborne laser oil spill remote sensing system has been developed. Operating from a U.S. Coast Guard Search and Rescue Aircraft, the system is expected to have the capability of remote detection, coarse oil classification (heavy, medium and light weight) and under certain conditions quantification of oil spills in the marine environment. The system concept is based on a recent investigation at TSC of laser stimulated oil fluorescence as a technique for the remote sensing of oil spills, including laboratory and field measurements. The development and laboratory tests results of the experimental system are described. (See also W76-09312) (Sinha-OEIS)

VOLUMETRIC DETERMINATION OF MARINE OIL SPILLS USING COORDINATED AIRBORNE AND SURFACE SAMPLING DATA,
California Univ. Santa Barbara.
J. E. Estes, P. G. Mikolaj, R. R. Thaman, and L. W. Senger.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 117-125, 9 fig, 3 tab, 3 ref. DOT-CG-23260-A; SG-2-35208.

Descriptors: *Oil pollution, *Oil spills, *Water pollution, *Remote sensing, *Pollution abatement, *Volumetric analysis, Sampling, Films, Monitoring, Sampling.
Identifiers: *Outer Continental Shelf, Airborne measurement, Ground truth.

The detection, measurement, and monitoring of oil pollution in the marine environment are receiving increased attention owing to: (1) the growing incidence of oil spills; (2) the associated need for improved cleanup procedures; and (3) the need for more effective surveillance systems, capable of gathering legal evidence for the prosecution of violators. The Geography Remote Sensing Unit and the Department of Chemical and Nuclear Engineering at the University of California, Santa Barbara for 2 1/2 years has been conducting experiments related to the application of remotely sensed data to these problem areas. As part of a United States Coast Guard test of a high seas oil containment device, a system for estimating the volume of oil loss resulting from oil pollution incidents was developed. This system involved the coordination of remote sensing data acquisition with simultaneous collection of surface sampling data. Results indicate that remotely sensed data, when effectively correlated with surface sampling data, can provide a base for volumetric estimations of a given oil slick. Refinements of these techniques can lead to more efficient, real-time day/night, operational monitoring of marine oil pollution incidents. (See also W76-09312) (Sinha-OEIS)
W77-00214

DEVELOPMENT OF U.S. COAST GUARD PROTOTYPE AIRBORNE OIL SURVEILLANCE SYSTEM,
Coast Guard, Washington, D. C.; and Aerojet Electrosystems Co. Azusa, Calif.

R. J. Ketchel, and A. T. Edgerton.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 127-137, 5 fig, 4 tab, 7 ref.

Descriptors: *Oil spills, *Oil pollution, Water pollution, Sea water, *Monitoring, *Remote sensing, Mapping, Equipment, *Pollutant identification.
Identifiers: *Outer Continental Shelf, Detection, Surveillance, Airborne equipment, Sensors, Multispectral sensors, Microwave radiometric imager.

The U.S. Coast Guard has contracted with the Aerojet Electrosystems Company, a Division of Aerojet-General Corporation, for the design, development and fight test evaluation of a prototype Airborne Oil Surveillance System. This system as conceived will utilize multispectral sensors to provide for the day/night all-weather airborne detection, mapping and documentation of oil spills at sea. The sensors used in this system will operate from the ultraviolet to the microwave region of the electromagnetic spectrum. This paper describes the development of this Airborne Surveillance System including the sensor mix and their relationship to the oil pollution surveillance mission. In addition the operational mission and system performance requirements used to define the system is considered. This prototype system will be ready for flight test evaluation by early 1974. W77-00215

REMOTE SAMPLER FOR DETERMINING RESIDUAL OIL CONTENT OF SURFACE WATERS,
Naval Ship Research and Development Center, Annapolis, MD.
P. Schatzberg, and D. F. Jackson.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 139-144, 3 fig, 6 tab, 2 ref.

Descriptors: *Surface waters, *Oil spills, *Oil pollution, Water pollution, *Water pollution sources, *Water quality control, Monitoring, *Sampling, Coasts, Estuaries.
Identifiers: *Outer Continental Shelf, Residual oil, Sorbent.

A simple flow-through device has been developed which, in conjunction with a skimmer and pump, can process 100 to 200 liters or more of surface water, removing any oil present in a separate phase. Thus concentrated, the oil can be extracted at a laboratory, its quantity and nature determined, and when related to the volume of water processed through the sampler, provide oil concentration data on a time-integrated basis. A laboratory apparatus was designed to generate a flowing water stream containing parts per million (ppm) quantities of oil. A number of sorbent materials were examined with this apparatus and several were found effective. Effort was concentrated on the most promising one. Experiments showed that 5-25 ppm oil in a flowing water stream is quantitatively absorbed by the sorbent. The concentrated oil is easily removed from the sorbent with carbon tetrachloride used as solvent and a Soxhlet extractor. The sorbent is regenerated by this process and can be reused many times. Concentration of the extracted oil is determined by infrared spectrophotometry. (See also W76-09312) (Sinha-OEIS)
W77-00216

AN OPTIMAL PREVENTION AND DETECTION MODEL FOR POLLUTION PATROL,
Purdue Univ., Lafayette, Ind. School of Industrial Engineering.
D. G. Olson, and G. P. Wright.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 145-150, 3 fig, 2 tab, 2 ref. DOT-CG-23308-A.

Descriptors: *Oil spills, *Oil pollution, *Water pollution, *Pollution abatement, Model studies, Equipment, Monitoring, Pollutant identification.
Identifiers: *Outer Continental Shelf, Detection, Surveillance, Sensors, Hazardous materials.

A flight scheduling model is presented for sensor (infra-red and ultra-violet) equipped aircraft whose mission is the detection and prevention of harbor and coastal oil and hazardous material pollution. The objective of the model is to maximize the expected number of pollution incidents detected per pollution flight. The model requires, as an input, parameters representing probabilities of pollution incidents occurring for different geographical sectors. These parameters are estimated using, coastwise and harbor, petroleum and hazardous material shipping statistics. The shipping statistics considered include movement of petroleum products along the Atlantic, Pacific, and Gulf coasts as well as the movement of such commodities in the intra-coastal waterway system and the Great Lakes. Particular port characteristics and past pollution incident statistics are also used to estimate required parameters of the scheduling model. The constraints in the model concern the availability of aircraft, flight hours, mission hours, and the significant environmental factors which affect the performance of the sensors. (See also W76-09312) (Sinha-OEIS)
W77-00217

OIL SPILL-SOURCE CORRELATION BY GAS CHROMATOGRAPHY: AN EXPERIMENTAL EVALUATION OF SYSTEM PERFORMANCE,
Woods Hole Oceanographic Institution, Mass.
O. C. Zafiriou, J. Myers, R. Bourbonniere, and F. J. Freestone.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 153-159, 3 fig, 5 tab, 5 ref. Also as: Woods Hole Oceanographic Institution Contribution No. 2994. EPA-18050 HEC.

Descriptors: *Oil spills, *Oil pollution, *Water pollution sources, *Pollutant identification, Gas chromatography, New York, Maine.
Identifiers: *Outer Continental Shelf, New York Bight, Performance evaluation, Detection.

A simple gas chromatographic method correlates unknown oils in natural waters with possible source oils. Under the operating procedures involved, unique matches are generally achieved without miscorrelations, even when up to 15 oils of the same type are possible sources. Oil samples are quantitatively characterized by ratios of intensities corresponding to their contents of several components of known geochemical variability and resistance to weathering. The effects of weathering, sample types, and added spill control chemicals were determined by 'blind' correlation of 35 artificially weathered oils, each with one of 17 possible sources. Oil type and weathering did not seriously influence spill-source matching success. The presence of highly similar source oils was the major performance-limiting factor. (See also W76-09312) (Sinha-OEIS)
W77-00218

TECHNIQUES FOR ANALYSIS OF PARAFFIN HYDROCARBONS AND FOR INTERPRETATION OF DATA TO ASSESS OIL SPILL EFFECTS IN AQUATIC ORGANISMS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. C. Clark, Jr, and J. S. Finley.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 161-172, 4 fig, 5 tab, 15 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution sources, *Environmental effects, *Water pollution effects, Gas chromatography, Algae, Mussels, Crabs, Snails, Oysters, Aquatic animals, Aquatic environment.
Identifiers: *Outer Continental Shelf, Paraffin hydrocarbons, Crude oil petroleum, Barnacles.

Normal paraffin hydrocarbons are one of the major groups of compounds in crude oil and petroleum products. Since these compounds can be readily separated from aquatic organisms using solvent extraction and liquid-solid chromatography and identified by gas-liquid chromatography, the normal paraffins can serve as indicators of petroleum pollution in the aquatic environment. It is necessary, however, to differentiate between natural (or biogenic) hydrocarbons and those assimilated by the organisms from pollution sources by comparing the natural hydrocarbon content and pattern of organisms from areas of pollution with those of organisms from relatively 'unpolluted' areas. The paper suggests techniques for obtaining and analyzing petroleum hydrocarbon data which can lead to a standard method for detecting and following the biological uptake of oil by living organisms from the aquatic environment. W77-00219

DETERMINATION OF N-ALKANE AND METHYLNAPHTHALENE COMPOUNDS IN SHELLFISH,
Battelle-Pacific Northwest Labs., Richland, Wash.
J. W. Blaylock, P. W. O'Keefe, J. N. Roehm, and R. E. Wildung.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 173-177, 2 fig, 2 tab, 5 ref.

Descriptors: *Shellfish, *Oil pollution, *Toxicity, Water pollution sources, Aquatic animals, *Bioassay, *Water pollution, Solvent extractions.
Identifiers: *N-alkane, *Methylnaphthalene, Hydrocarbons, Petroleum, Tissue digestion, Column separation.

During the course of investigations to determine the possible toxicity of petroleum to marine biota, it became evident that quantitative estimates of the petroleum components in water and biota would assist in meaningful interpretation of the results of bioassays. A method originally utilized for determination of polycyclic aromatic hydrocarbons in foods was adapted for the digestion of tissue and extraction of hydrocarbons from shellfish exposed to petroleum during bioassays. Tissue extracts were partitioned into saturate and aromatic fractions by column chromatography. Using gas-liquid chromatography, the n-alkanes of carbon numbers 12 to 19, and the methyl substituted naphthalenes were identified in the saturate and aromatic fractions, respectively. Both groups of compounds were quantiated by reference to an internal standard. The procedure allowed recovery of over 70% of n-alkanes and methylnaphthalenes applied to the tissues prior to digestion. Minimum detectable levels for n-alkanes and methylnaphthalenes were approximately 0.08 to 0.15 and 0.03 to 0.04 microgram/g of wet tissue, respectively. (See also W76-09312) (Sinha-OEIS)
W77-00220

IDENTIFICATION OF OIL POLLUTANTS: A REVIEW OF SOME RECENT METHODS,
National Environmental Research Center, Edison, N. J. Edison Water Quality Research Div.
M. Gruenfeld.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 179-193, 9 fig, 11 tab, 5 ref, append.

Descriptors: *Pollutant identification, *Oil spills, *Oil pollution, Water pollution, *Gas chromatography, *Spectrophotometry, *Methodology.
Identifiers: *Outer Continental Shelf, Passive tagging, Crude oils, Spectrometry.

Some recent studies of methods for identifying weathered oils through chemical fingerprints (passive tagging) are reported. These studies were performed by Esso Research and Engineering Company, Phillips Scientific Corporation, Woods Hole Oceanographic Institution, and Baird Atomic Corporation under U.S. Environmental Protection Agency (EPA) sponsored grants and contracts. A broad range of analytical instruments and techniques were used, e.g., adsorption chromatography, molecular emission and absorption spectrophotometry, atomic absorption spectrophotometry, gas chromatography, computerized mass spectrometry, et. al. Some of the oil parameters evaluated as potential fingerprint indices are vanadium, nickel, sulfur and nitrogen content, gas chromatographic profile appearance, carbon and sulfur isotope ratios, API gravity, and pour point. Several promising methods for passive tagging oils are suggested by these studies. (See also W76-09312) (Sinha-OEIS)
W77-00221

A MULTIPARAMETER OIL POLLUTION SOURCE IDENTIFICATION SYSTEM,
Phillips Petroleum Co., Bartlesville, Okla. Research Div.
J. W. Miller.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 195-203, 6 fig, 2 tab, 10 ref. EPA-No. 68-01-0059.

Descriptors: *Pollution identification, *Water pollution sources, *Oil spills, *Oil pollution, Tagging, Transportation, Laboratory tests, Organic compounds.
Identifiers: *Outer Continental Shelf, Crude oil.

The key parameters of carbon and sulfur isotopic composition, total sulfur, nitrogen, vanadium, nickel and normal paraffin odd-even carbon number predominance were measured on the 600+F residue, which simulates a weathered sample of crude oil. The variation of these parameters among 80 crude oils representative of worldwide sources of water-transported oils forms the basis of an identification system. The parameter range was carbon isotopic composition, -22 to -30 per mil; sulfur isotopic composition, -14 to +20 per mil; total sulfur 0.05 to 6.0 weight per cent; nitrogen 0.02 to 0.73 weight per cent; vanadium 0.2 to 466 wppm; nickel 0.2 to 128 wppm; and odd-even carbon number predominance 0.8 to 1.3. An unknown oil is identified by comparison of these parameters with those in a data library or from suspected sources. A computer 'look-up' system was demonstrated to match any one of the 80 crude oils with an unknown. The identification potential is strengthened by addition of the diagnostic parameters of percentage saturates, aromatics and asphaltics as measured by silica gel chromatography and the gas-liquid chromatography hydrocarbon and sulfur profiles ('fingerprints'). W77-00222

CHARCTERISTICS OF NATURALLY OCCURRING AND POLLUTANT HYDROCARBONS IN MARINE SEDIMENTS,
Paris Univ. (France).
M. Tissier, and J. L. Oudin.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p. 205-214, 12 fig, 1 tab, 31 ref.

Descriptors: *Oil spills, *Oil pollution, *Pollutant identification, *Water pollution sources, *Toxicity, *Environmental effects, *Mud, Sediments, Aquatic animals, Ecosystems, Laboratory tests.
Identifiers: *Outer Continental Shelf, French coast, Alkyl-aromatics, Aromatic hydrocarbons.

Hydrocarbons spilled on the sea may, naturally or by sinking agent, settle on the sea bed and pollute marine muds which are the substratum of the benthic fauna and flora. They may be adsorbed by these organisms which are the basis of the nutrition for a large part of the aquatic fauna. This hydrocarbon pollutants will enter by this way in the marine food chain and raise the problem of long term toxicity. It is important to measure the quantity of hydrocarbons in the marine sediments in order to know the level of pollution. A detailed analysis of the chloroform extract of the sediment by chromatography, mass spectrometry and U.V. fluorescence can discriminate between unpolluted and polluted sediments even in the case of low level pollution. It has been noted in the unpolluted samples (collected on the French coast of the English channel in Normandie and in the Seine Bay) a higher percentage of heavy products (resins and asphaltenes), a more important odd carbon dominance in the n-alkanes distribution than in the polluted ones. The aromatic fraction of the indigenous hydrocarbons is mainly composed of polycyclic aromatic hydrocarbons without alkyl chains whereas polluted samples show many types of alkyl-aromatics. COMPARATIVE IDENTIFICATION OF OIL SPILLS BY FLUORESCENCE SPECTROSCOPY FINGERPRINTING,
Environmental Protection Agency, Edison, N. J. Surveillance and Analysis Div.; and Environmental Protection Agency, Edison, N. J. Region II.
W. A. Coakley.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 215-222, 12 fig, 7 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution sources, *Pollutant identification, Gas chromatography.
Identifiers: *Outer Continental Shelf, *Fluorescence spectroscopy, Emission spectrum.

A simple and rapid method for the comparative identification of oil spills with suspect source oils is described using fluorescence spectroscopy. The method involves the excitation of an oil, diluted in cyclohexane, at a distinct wavelength and obtaining a 'fingerprint' in the form of an emission spectrum. Contamination and weathering of the environmental oil is considered. The method is applied to two different oil spills occurring near the same area at about the same time. Results are confirmed by gas chromatography. (See also W76-09312) (Sinha-OEIS)

DETERMINATION OF HYDROCARBON SOLUBILITY IN SEA WATER AND THE ANALYSIS OF HYDROCARBONS IN WATER-EXTRACTS,
National Bureau of Standards, Washington, D. C. Inst. for Materials Research.
S. P. Wasik, and R. L. Brown.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 223-227, 5 fig, 6 ref.

Descriptors: *Oil spills, *Oil pollution, *Pollutant identification, *Water pollution sources, *Environmental effects, Sea water, Gas chromatography, Oceans, Toxicity, Solubility.
Identifiers: *Outer Continental Shelf, Hydrocarbons analysis.

An apparatus is described for measuring the solubility of hydrocarbons in sea water and for analyzing hydrocarbons in water-extracts. The relative concentrations of the hydrocarbons in the gas phase in equilibrium with the water extract were determined by gas chromatography. A known volume of the gas phase was purged out from the apparatus and replaced with helium. The concentration of the hydrocarbons were measured after the second equilibration. The solubility of the hydrocarbon solutes in the sea water extract were determined from the peak area ratios of the solute peaks and the volume of the apparatus. Complex mixtures of hydrocarbons in aqueous solutions may be analyzed using this apparatus by examining the chromatograms obtained after each flush out. The peaks are identified as to hydrocarbon group (olefinic, aromatic, paraffinic) from the rate that the solute peak area decreased after each flush out. Overlapping peaks may be resolved using this technique. By extrapolating peak areas to zero flush out, the concentration of each solute in the original extract may be obtained. The analysis of a non-lead gasoline in sea water is presented. (See also W76-09312) (Sinha-OEIS)

THE ISOLATION AND CHARACTERIZATION OF HYDROCARBON-UTILIZING BACTERIA FROM CHEDABUCTO BAY, NOVA SCOTIA,
Rhode Island Univ., Kingston. Dept. of Plant Pathology-Entomology.
A. M. Cundell, and R. W. Traxler.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC. March 13-15, 1973. p 421-426, 5 fig, 2 tab, 18 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Bacteria, Treatment, Seawater, Sediments, Littoral, *Canada, Bays, Pollutant identification.
Identifiers: *Outer Continental Shelf, Nova Scotia, Bunker oil, Fuel oil, Naphthalene, Bacterial flora, Oliphatic hydrocarbons, Aromatic hydrocarbons, Chedabucto Bay (NS).

Hydrocarbon-utilizing bacteria were isolated by enrichment culture techniques from littoral sediments and seawater collected in Chedabucto Bay, Nova Scotia, in 1972. The sample area received major Bunker C oil pollution in February 1970. Enrichment substrates were naphthalene, and Nos. 1 and 6 fuel oils incubated at 0.8 and 25C. Isolates have been obtained from samples of sediment and seawater on all enrichment substrates at temperatures of 25C and 8C. Each isolate has been shown to grow on seawater medium with No. 1 fuel oil as the substrate. The isolates were screened on n-hexane, n-dodecane, 2,2-dimethylhexane, methylcyclohexane, p-xylene, n-hexylbenzene, and naphthalene to demonstrate their profile of hydrocarbon utilization. Both aliphatic and aromatic hydrocarbon degrading bacteria were obtained from the samples. The relative rate of growth of each isolate on solid media with the various substrates has been determined at 0,8,16 and 24C. Viable cell counts in liquid culture with isolate 6-A7-25-1 were performed at 10C and 20C on naphthalene and n-hexadecane to determine generation time and lag time. (See also W76-09312) (Sinha-OEIS)

DEVELOPMENT OF METHODOLOGY AND APPARATUS FOR THE BIOASSAY OF OIL,
Battelle-Pacific Northwest Labs., Richland, Wash.
J. A. Lichatowich, P. W. O'Keefe, J. A. Strand, and W. L. Templeton.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference. Washington, DC, March 13-15, 1973. p 659-666, 6 fig, 3 tab, 17 ref.

Descriptors: *Bioassay, *Oil spills, *Oil pollution, *Water quality control, *Water pollution, Aquatic plants, Aquatic animals, *Methodology.

Identifiers: *Petroleum, Biological effects, Crude oil, Refined oil, Apparatus.

Techniques that may be applied in the bioassay of oil and other non-miscible materials are summarized. Bioassay procedures are described that are conducted in the flow-through tanks equipped with gravity oil metering systems and static mixers to equilibrate diluent water. Oil concentrations measured at different depths are utilized to calculate the mean level of exposure of the test organisms in the water column. Habitat preference and behavior of the test organism during bioassay were assessed in relationship to toxicity. (See also W76-09312) (Sinha-OEIS)

VERSATILE MULTIRANGE ANALYTICAL MANIFOLD FOR AUTOMATED ANALYSIS OF NITRATE-NITROGEN,
Agricultural Research Service, Watkinsville, Ga.
W. A. Jackson, C. E. Frost, and D. M. Hildreth.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 592-593, May-June 1975. 2 fig, 1 tab, 9 ref.

Descriptors: *Nitrates, *Nitrogen, Nutrients, Laboratory equipment, Laboratory tests, Soil chemistry, *Pollututant identification, Automation, Analytical techniques.
Identifiers: Technicon autoanalyzer, *Nitrate-nitrogen.

A technique is described for extending up to 100 ppm the limits of determining nitrate-nitrogen in solution using a Technicon Autoanalyzer system. The same modified analytical manifold can be used to determine three concentration ranges of nitrate nitrogen 0-1, 0-10, and 0-100 ppm. To change concentration range, change the sample entry point in the manifold and standardize the instrument within the proper range. (Skogerboe-Colo St)

THE IMPACT OF MAN ON THE WORLD NITROGEN CYCLE,
Purdue Univ., Lafayette. Dept. of Agricultural Economics.
B. McCarl, D. Raphael, and E. Stafford.
Journal of Environmental Management, Vol. 3, No. 1, p. 7-19, January 1975. 2 fig, 4 tab, 4 ref.

Descriptors: *Nitrogen, Atmosphere, *Model studies, Chemical reactions, *Nitrogen cycle, Environmental effects, *Air pollution effects.

The atmosphere is a complex chemical system in which nitrogen emissions, resulting from man's occupancy of the earth, mix and interact with natural nitrogen emissions. By examining the flow of nitrogen within the world, it is possible to improve the understanding of how man's emissions affect the natural nitrogen cycle. Obviously the direct effects of man's nitrogen emissions are multiplied by the natural cycle. An attempt is made to determine the multiplier effect. Through the use of input-output methodology a system with homogeneous flow may be analyzed, finding the multiplier effects. Homogeneous flow is attained in the nitrogen cycle by converting all flows into their accompanying nitrogen content. The system is then modelled and a solution derived. One ton of man's nitrogen input is then seen to produce some 800 tons of flow. (Skogerboe-Colo St)

THE SPECTROPHOTOMETRIC DETERMINATION OF ARSENIC IN SEA WATER, POTABLE WATER, AND EFFLUENTS,
Liverpool Univ. (England). Dept. of Oceanography.
M. G. Haywood, and J. P. Riley.
Analytica Chimica Acta, Vol. 85, No. 2, p 219-230, September, 1976. 1 fig, 6 tab, 25 ref.

Descriptors: *Water analysis, *Pollutant identification, *Arsenic compounds, *Potable water, Sea water, Effluents, *Spectrophotometry, Analytical techniques, Photometry, Copper, Nickel, Cadmium, Metals, Separation techniques, Ion exchange, Ultraviolet radiation, Oxidation, Trace elements, Water pollution sources, Water properties, Water chemistry, Heavy metals.
Identifiers: Sodium borohydride, Silver, Bismuth, Nitric acid, Sulfuric acid, *Arsenic.

Procedures are described for the determination of arsenic in sea water, potable waters, and effluents. The sample is treated with sodium borohydride added at a controlled rate. The arsine evolved is absorbed in a solution of iodine and the resultant arsenate ion is determined photometrically by a molybdenum blue method. For sea water the range, standard deviation, and detection limit are 1-4 micrograms/liter, 1.4%, and 0.14 micrograms/liter, respectively; for potable waters they are 0-800 micrograms/liter, about 1% (at 20 micrograms/liter) and 0.5 micrograms/liter, respectively. Silver and copper cause serious interference at levels of 0.5 micrograms/liter, and nickel, cadmium, and bismuth interfere at concentrations of a few tens of mg/liter; however, these elements can be removed either by preliminary extraction with a chloroform solution of dithizone or by ion-exchange. Arsenic present in organo-arsenic compounds is not directly determinable, but can be rendered reactive either by photolysis with ultraviolet radiation or by oxidation with permanganate or nitricsulfuric acid mixture. Arsenic(V) can be determined separately from total inorganic arsenic after extracting arsenic(III) as its pyrrolidine dithiocarbamate into chloroform. (Witt-IPC)

RE-ASSESSMENT OF CHELATING ION-EXCHANGE RESINS FOR TRACE METAL ANALYSIS OF SEA WATER,
Liverpool Univ. (England). Dept. of Oceanography.
M. I. Abdullah, O. A. El-Rayis, and J. P. Riley.
Analytica Chimica Acta, Vol. 84, No. 2, p 363-368, July 1976. 1 tab, 18 ref.

Descriptors: *Ion exchange, *Water analysis, *Heavy metals, *Trace elements, *Pollutant identification, *Sea water, Chelation, Copper, Cadmium, Lead, Zinc, Resins, Colloids, Acids, Digestion, Electrochemistry, Centrifugation, Adsorption, Separation techniques, Analytical techniques, Water pollution sources, Metals, Cations, Polarographic analysis.
Identifiers: Voltametry.

The behavior of the chelating ion-exchange resin Chelex-100 for collection of trace metals from sea water has been studied by anodic stripping voltametry after acid digestion of the sea water sample and the resin effluent. All the naturally occurring electrochemically reducible species of Cu, Pb, Cd, and Zn are chelated by the resin; this fraction of these metals is regarded as the dissolved fraction. Centrifugation showed that some of the metal liberated by acid digestion is associated with colloidal species. Neither this nor the metal adsorbed on fine particles is affected or removed by the chelating resin. (Witt-IPC)

THE DETERMINATION OF ZINC, CADMIUM, LEAD AND COPPER IN A SINGLE SEA-WATER SAMPLE BY DIFFERENTIAL PULSE ANODIC STRIPPING VOLTAMMETRY,
Liverpool Univ. (England). Dept. of Oceanography.
M. I. Abdullah, B. R. Berg, and R. Klimek.
Analytica Chimica Acta, Vol. 84, No. 2, p 307-317, July, 1976. 4 fig, 4 tab, 21 ref.

Descriptors: *Water analysis, *Heavy metals, *Trace elements, *Pollutant identification, *Sea water, *Zinc, *Cadmium, *Copper, Lead, Hydrogen ion concentration, Trace elements, Chemical analysis, Analytical techniques, *Electrodes, Water pollution sources, Metals, Cations, Polarographic analysis.
Identifiers: *Voltametry, Gallium.

A comparative study is described of the anodic stripping voltametry of sea water at its natural pH and at acetate-buffered pH, with a mercury film electrode. The reproducibility of the oxidation current peaks for copper and lead is improved and the electrode memory effect decreases when the sample is acetate-buffered (pH 5.8). Determinations of zinc at the natural pH of sea water are inaccurate, because of the formation of Zn-Cu and Zn-Ni intermetallic compounds in the mercury film. The formation of such compounds can be prevented by the addition of gallium ions to acetate-buffered samples. A procedure for the determination of Cu, Pb, Cd, and Zn in sea water is described. (Witt-IPC)

T. A. Bellar, J. J. Lichtenberg, and J. W. Eichelberger.
Environmental Science and Technology, Vol. 10, No. 9, p 926-930, September, 1976. 14 fig, 11 ref.

Descriptors: *Water analysis, *Gas chromatography, *Pollutant identification, Analytical techniques, Trace elements, Chemical analysis, Water pollution sources, Water properties, Mass spectrometry, Silica, Gels, Organic compounds, Chemical wastes, Industrial wastes, Chlorides.
Identifiers: *Vinyl chloride, Chlorine compounds.

A quantitative method for the determination of vinyl chloride in water is presented. An inert gas is bubbled through the water sample to transfer the vinyl chloride to the gas phase. The vinyl chloride is concentrated on silica gel or Carbosieve-B under noncryogenic conditions and determined by gas chromatography with a halogen-specific detector. The method was tested over a range of 4-40 micrograms/liter. Based on earlier work with similar compounds, a useful working range of 0.1-2500 micrograms/liter should be achievable. Gas chromatography-mass spectrometry methods for providing confirmatory identification of vinyl chloride are described. (Witt-IPC)

STATE OF WISCONSIN AUTOMATIC WATER QUALITY MONITORING SYSTEM FOR THE FOX AND WISCONSIN RIVERS,
Wisconsin Dept. of Natural Resources, Wisconsin Rapids.
H. W. Weckwerth, P. J. Manor, and S. J. Kleinert.
In: Proceedings of the International Seminar and Exposition on Water Resources Instrumentation, June 4-6, 1974, Chicago, Illinois, Ann Arbor Science Publishers, Ann Arbor, Michigan, Vol. 1, p 452-483, 1975. 13 fig, 7 tab.

Descriptors: *Water quality, *Monitoring, *Wisconsin, *Pulp wastes, *Rivers, Data collections, Sampling, Water pollution sources, Water pollution, Pulp and paper industry, Hydroelectric plants, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Electrical conductance, Turbidity, Computers, Data processing, Maintenance, Repairing, Calibrations, Organic wastes, Remote sensing, Instrumentation, Automation.
Identifiers: *Fox River(Wisc), *Wisconsin River(Wisc).

An automatic monitoring system has been operated since 1971 to provide a continuous water quality record for the Upper Wisconsin and Lower Fox Rivers which receive large amounts of organic wastes from pulp and paper mills. Continuous monitoring of the streams is necessary to document improvements in water quality expected as results of the implementation of pollution-abatement programs, and to identify locations where further efforts will be needed. The system utilizes remote monitors installed at hydroelectric plants and paper mills. It comprises 6 stations that monitor dissolved oxygen, temperature, pH, and electroconductivity on the Upper Wisconsin and 5 stations that monitor the same four variables plus turbidity on the Lower Fox. All monitors are unattended and measure each parameter by means of probes placed in the water flow. Electric signals for all parameters are sent hourly via telephone wire to a central computer in Madison which receives, records, and summarizes 1,176 water quality measurements daily. Practical considerations of system maintenance, repair, calibration, and accuracy are reviewed. (Brown-IPC)

Descriptors: *Rivers, *Sampling, *Water levels, Analyses, Suspended solids, Chemical analysis, Spectroscopy.
Identifiers: *Austria, *Danube River, Spectrochemical analysis, Atomic absorption.

The water of the Danube was sampled at 6 points in Austria during periods of highest and lowest water levels. Suspended substances were analyzed for more than 40 elements with the aid of atomic absorption and spectrochemical and chemical methods. The results are compiled in tables. Compared with other European streams the Danube River is scarcely polluted with inorganics. Correlations between the water level and the chemical constitution of dissolved and mechanically transported substances were found.--Copyright 1976, Biological Abstracts, Inc.

SUITABILITY OF CONTAINERS FOR STORAGE OF WATER SAMPLES,
Australian Mineral Development Labs., Adelaide.
D. C. Bowditch, C. R. Edmond, P. J. Dunstan, and J. A. McGlynn.
Australian Water Resources Council, Canberra, Technical Paper No. 16, 1976. 39 p, 17 tab, 20 ref.

Descriptors: *Water analysis, *Water quality, *Sampling, *Laboratory tests, Chemical analysis, Plastics, Aluminum, Phosphorus compounds, Silica, Zinc.
Identifiers: *Storage containers, Glass.

Despite an increasing use of field monitoring instruments, the usual method of water quality assessment is by field sampling and subsequent analysis in the chemical laboratory. A step in this sequence is the storage of the sample in a container; any change in water quality occurring during the storage step will yield laboratory analysis which does not reflect the quality of the water as originally sampled. A study undertaken to detect interactions between containers and water samples found that most of the 25 water quality parameters (mineral analyses) tested were satisfactorily represented after storage in containers made from low or high density polyethylene or from soft glass. The exceptions were: orthophosphate was apparently adsorbed by high density polyethylene or soft glass, unless the materials were iodine-impregnated; and glass containers were unsatisfactory for silica, aluminum and zinc determinations. Proceedings of the Royal Australian Chemical Institute, Vol 43, No. 3, p 73-79, March 1976. 5 fig, 3 tab, 18 ref.

Descriptors: *Heavy metals, Water pollution sources, *Bays, *Australia, Analytical techniques, *Cadmium, *Copper, *Lead, *Zinc, Industrial wastes, Spectroscopy, Sampling, Bottom sediments, Adsorption, Pollutant identification.
Identifiers: *Corio Bay(Vic), Geelong(Vic), Anodic stripping voltammetry, Atomic absorption spectroscopy.

Levels of copper, cadmium, lead and zinc were determined in samples of water and sediment from four sites in Corio Bay in southern Victoria, an area of potentially high metal pollution due to low water circulation and proximity to the industrial area of Geelong. A report is presented which emphasises techniques of sampling and analysis for valid results. Water samples were tested by anodic stripping voltammetry and by atomic absorption spectroscopy using both solvent extraction and ion exchange for preconcentration; sediments by conventional atomic absorption spectroscopy. The distribution of metal contents found in the water was consistent with the known sources of pollution. It was found that high surface areas of sediments were associated with high metal contents, supporting a hypothesis that removal of heavy metal from water involves adsorption onto fine particulate matter. L. H. Keith.
In: Identification and Analysis of Organic Pollutants in Water (Keith, L. H., editor), Ann Arbor Science Publishers, Ann Arbor, Michigan, p 671-707, 1976. 10 fig, 5 tab, 26 ref.

Descriptors: *Pulp wastes, *Organic compounds, *Pollutant identification, *Waste water treatment, Wastes, Industrial wastes, Gas chromatography, Mass spectrometry, Water pollution sources, Waste treatment, *Georgia, Trickling filters, Aerated lagoons, Lime, Flocculation, Oxidation ponds, Biochemical oxygen demand, Phenols, Biological treatment, Treatment facilities, Pollutants, Analytical techniques, Water pollution treatment, Organic acids, Persistence.
Identifiers: Terpenes, Resin acids, Total organic carbon, Fatty acids, Kraft mills, Board mills.

Effluents from 2 integrated kraft board mills in Georgia were sampled at various points in their waste treatment systems. Gas chromatography of the organic extracts and identification of many specific compounds by combined gas chromatography/mass spectrometry provided a chemical profile of these effluents. Raw waste water compositions of both mills were similar, but treatments differed. One mill (an unidentified linerboard producer) used trickling filters with aerated lagoons; the other (Interstate Paper Corp., Riceboro) used lime flocculation plus stabilization lagoons. Despite these differences, the treated waters showed similar qualitative compositions, although individual components (especially fatty acids) varied quantitatively. When raw and treated effluents were resampled 2 years later, concentrations of organics were different, but the same volatiles were still present. It is concluded that the volatile organic composition of kraft effluents (amounting to 1 to 10% of TOC) remains fairly constant as long as raw materials and manufacturing processes remain unchanged. Because of rapid fluctuations in the amounts of effluent organics, composite samples are needed for representative quantitative analyses. Both treatment systems achieved 85-90% reductions in BOD, 75-80% drops in volatile acids and volatile phenols, and 90% or better reductions in terpenes. Chemicobiological treatment reduced the TOC by 80-85%, total resin acids by 74% (to 6.4 mg/liter), and total phenols by 94% (to 0.2 mg/liter), compared to 60-65%, 87% (to 1.4 mg/liter), and 73% (to 0.6 mg/liter) for biological treatment alone. Treated effluents from both mills contained more fatty acids (branched and odd-numbered carbon compounds) than did the raw waste waters, probably derived from metabolites of aquatic pond organisms. IDENTIFICATION OF TWO CHLORINATED GUAIACOLS IN KRAFT BLEACHING WASTEWATERS,
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
I. H. Rogers, and L. H. Keith.
In: Identification and Analysis of Organic Pollutants in Water (Keith, L. H., editor), Ann Arbor Science Publishers, Ann Arbor, Michigan, p 625-639, 1976. 4 fig, 2 tab, 16 ref.

Descriptors: *Bleaching wastes, *Phenols, *Pollutant identification, Gas chromatography, Mass spectrometry, Wastes, Industrial wastes, Water pollution sources, *Toxicity, Water pollution effects, Fishkill, Lignins, Biological treatment, Analytical techniques, Pollutants, Organic compounds, Effluents, *Canada.
Identifiers: *Guaiacols, Kraft mills, Resin acids, Chlorine compounds, Coho Salmon.

Trichloroguaiacol concentrations up to 57% of the LC(50) value and tetra-chloroguaiacol levels up to 32% of the LC(50) value were measured in kraft mill bleach plant (alkaline extraction stage) effluents. The toxicity associated with these compounds can explain at best only a fraction of the caustic effluent's overall toxicity which caused fish kill at 10% concentration. Among other compounds identified, only resin acids (present in very low concentrations) were known toxicants. Undetected compounds contributing much of the observed toxic effect may be chlorinated lignin residues with molecular weights too high for gas chromatographic analysis. A sample of whole-mill kraft effluent discharged after biological treatment in a 5-day lagoon was acutely toxic to fish at 65% concentration and contained no detectable resin acids. Gas chromatographic/mass spectrometric analyses revealed over 100 compounds, many of them chlorinated, including tri- and tetrachloroguaiacol in concentrations of 98 and 70 micrograms/liter, respectively. CHLORINATED GUAIACOLS IN BLEACHERY WASTES: COMMENTS ON A PAPER BY LEACH AND THAKORE,
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
I. H. Rogers.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 8, p 1858-1860, August, 1976. 1 fig, 7 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, *Phenols, *Pollutant identification, *Toxicity, Pulp and paper industry, Effluents, Salmonids, Water pollution sources, Wastes, Industrial wastes, Water pollution effects, Organic compounds.
Identifiers: 3,4,5-Trichloroguaiacol, 3,4,5,6-Tetrachloroguaiacol, Chlorine compounds, Kraft mills, *Chlorinated guaiacols.

Tri- and tetrachloroguaiacol are constituents of kraft bleachery wastes which are acutely toxic to salmonids. There are four possible structural isomers of trichloroguaiacol, and no evidence was presented by Leach and Thakore to support their claim that the compounds they found had the 3,4,5-substitution pattern; cf. Journal of the Fisheries Research Board of Canada, Vol. 32, No. 8, p 1249-1257, August, 1975. (See W76-02332). Details as to how Leach and Thakore synthesized their standard chlorinated guaiacols were not presented. Identification of chlorinated resin acids and epoxides derived from unsaturated fatty acids is considered to indicate poor pulp washing efficiency, and Rogers has not observed such compounds in caustic extraction effluents from mills he has studied. (CHLORINATED GUAIACOLS IN BLEACHERY WASTES--) RESPONSE TO THE COMMENTS OF I. H. ROGERS,
B. C. Research Ltd., Vancouver.
J. M. Leach, and A. N. Thakore.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 8, p 1860-1861, August, 1976. 3 ref.

Descriptors: *Pulp wastes, *Phenols, *Bleaching wastes, *Pollutant identification, *Toxicity, Pulp and paper industry, Effluents, Water pollution sources, Water pollution effects, Organic compounds, Wastes, Industrial wastes.
Identifiers: 3,4,5-Trichloroguaiacol, 3,4,5,6-Tetrachloroguaiacol, Chlorine compounds, Kraft mills, *Guaicols.

In a previous article the authors claim that 3,4,5-tri- and 3,4,5,6-tetrachloroguaiacol are important toxic constituents of caustic extraction effluents from kraft pulp mill bleach plants; cf. Journal of the Fisheries Research Board of Canada, Vol. 32, No. 8, p 1249-1257, August, 1975. Rogers' contention that these compounds are not present in these effluents (cf. Journal of the Fisheries Research Board of Canada, Vol. 33, No. 8, p 1858-1860, August, 1976) is rebuked by the authors. (See also W77-00467) (Witt-IPC)

CAPACITY OF A SPARTINA SALT MARSH TO ASSIMILATE NITROGEN FROM SECONDARILY TREATED SEWAGE,
Georgia Univ., Sapelo Island. Marine Inst.
A. G. Chalmers, E. B. Haines, and B. F. Sherr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 640, Price codes: A05 in paper copy, A01 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No. ERC 0776, July 1976. 88 p, 21 fig, 26 tab, 54 ref. OWRT A-057-GA(1). 14-31-0001-5010.

Descriptors: *Sewage sludge, *Nitrogen, *Salt marshes, *Denitrification, *Georgia, Sludge treatment, Sludge disposal, Soil analysis, Waste assimilative capacity, Plant growth, Fertilization.
Identifiers: *Spartina alterniflora.

Air-dried, pulverized secondarily treated sewage sludge was applied to duplicate 100 m2 plots in a short Spartina high marsh near Sapelo Island, Georgia, at a rate of 200 g sludge, or 4 g nitrogen per square meter every two weeks for 12 months. Monthly measurements were made of nitrogen pools in the marsh plants and soils in the experimental plots and in duplicate control plots in the high marsh and in a low marsh area. Potential denitrification rates were also analysed for marsh soils in the study sites. Sludge fertilization of the salt marsh resulted in increased plant growth, increased content of total nitrogen in the surface marsh soils, and increased concentration of exchangeable ammonium in the top 30 cm of the soil profile. Contrary to expectation, the sludge appeared to inhibit the activity of denitrifying bacteria in the marsh soils. At the end of the study, only 50% of the sludge nitrogen applied remained on the plots, most in the surface soil. Since the natural rate of sedimentation is low in the Georgia salt marshes, the missing nitrogen was probably washed off the plots via tidal flow. There were no major differences between nitrogen pools in the control low and high marsh areas; however, the data suggested that greater mineralization rates of organic matter in low marsh soils could result in the differences in vigor and productivity between low and high marsh Spartina plants which can be ascribed to nitrogen availability.

IMPACT OF LAND DISPOSAL OF SLUDGES ON GROUNDWATER,
Geraghty and Miller, Port Washington, N.Y.
G. R. Wilson.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 193-199. 5 fig, 2 tab, 16 ref.

Descriptors: *Pollutant identification, *Sludge disposal, *Land use, *Groundwater, *Water quality, Hydrologic aspects, Evaluation, Sites.

The many problems involved in evaluating the impact of land disposal of sludges on groundwater quality are discussed, with particular emphasis on the hydrologic aspects. The purpose of the discussion is to direct attention to the complexity of the subject, and to suggest some practical considerations that may be applied in evaluating potential disposal sites. The factors governing the chemical and transport behavior of contaminants through the zone of aeration and in the aquifer are enormously complex. At present there appears to be little prospect of any accurate prediction of them prior to the emplacement of sludge, or any other potential contaminant source. This situation may be rectified by theoretical and laboratory studies and by data from field investigations. It is possible to draw up guidelines for land disposal of both sludge and effluent, and this has been done by numerous agencies. These guidelines, however, cannot be definitive. Each proposed disposal site must

be studied and evaluated indivdually . (See also W77-00009) (Snyder-FIRL)

A PHOSPHORUS RESIDENCE TIME MODEL: THEORY AND APPLICATION,
Texas Univ. at Dallas, Richardson. Inst. for Environmental Sciences.
W. C. Sonzogni, P. C. Uttormark, and G. F. Lee.
Water Research, Vol. 10, No. 5, p 429-435, 1976. 2 fig, 1 tab, 25 ref.

Descriptors: *Phosphorus, *Lakes, *Environmental engineering, *Mathematical models, Management, Nutrients, Sedimentation rates, Equations, Systems analysis, *Water quality control, *Path of pollutants.
Identifiers: *Residence time model, *Chemical modeling, Steady state.

Chemical residence time has been used as a basis for modeling the chemical content of the ocean for some time. Recently, the chemical residence time approach has been used to model the rate of recovery of several lakes following pollution abatement. This paper relates the theoretical basis for the chemical residence time model as it applies to phosphorus and discusses the limits, capabilities and applications of the model. The model is potentially useful for assessing a variety of lake rehabilitation procedures. Effects of improved waste water treatment may be simulated by reducing the influx concentration and the impact of diversion projects can be estimated by altering both the influx concentration and the volumetric flow rate. ANALYTICAL SOLUTION FOR 3-D DIFFUSION MODEL,
Envirosphere/EBASCO, New York.
E. Y. T. Kuo.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE4, Proceedings Paper 12315, p 805-820, August 1976. 8 fig, 3 ref, 3 append.

Descriptors: *Diffusion, *Open channel flow, *Dispersion, *Thermal pollution, *Dye dispersion, Hydraulics, Analytical techniques, Estuaries, Unsteady flow, Methodology, Turbulence, Equations, Mathematical studies.
Identifiers: *Constant parameter river, Absorption coefficient.

It is often desirable to estimate the ambient diffusion characteristics in a laterally bounded river and estuary, once discharge loses its momentum to its entrainment mixing processes. Although turbulent diffusions are three-dimensional in nature, the main mean convective transport and the variations of the dispersion characteristics in a river have been assumed to be longitudinal to make the problem tractable. Analytical expressions were derived for solving dye and heat diffusion in the case of their instantaneous as well as continuous release. The analytical solutions were presented for diffusion problems related to a constant parameter river. An application of the solution to a dye data analysis was described. The results indicated general agreement between the data and theoretical prediction despite the many simplifying assumptions made to obtain the analytical solution. (Singh-ISWS)

DISPOSITION OF FERTILIZER NITRATE APPLIED TO A SWELLING CLAY SOIL IN THE FIELD,
Texas Agricultural Experiment Station, College Station.
D. E. Kissel, S. J. Smith, and D. W. Dillow.
Journal of Environmental Quality, Vol. 5, No. 1, p 66-71, January-March 1976. 4 fig, 3 tab, 19 ref.

Descriptors: *Nitrogen compounds, *Nitrates, *Fertilizers, *Leaching, *Soil chemistry, Water quality, Analytical techniques, Leachate, Drainage, Nutrients, Runoff, Subsurface drainage, Water pollution sources, Nutrient removal, Water pollution, Percolation, Infiltration, Lysimeters, Drainage water, Grain sorghum, Root zone, Path of pollutants.
Identifiers: *Nitrate leaching, Nitrogen balance, *Nitrate fertilizer, *Nitrate-nitrogen, *Leaching losses, Nitrogen fertilizer efficiency, Nitrogen 15, Field-drainage lysimeters, Total nitrogen, Ammonium-nitrogen.

This study was prompted by the present controversy over the role that N-fertilizer use may have in reducing water quality. The objective was to determine the disposition of N fertilizer (enriched with 15N) applied to level (less than 2% slope) Houston Black clay near the economic optimum application rate (112 kg N/ha) for grain sorghum. Particular emphasis was placed on determining the amount of applied N which leached below the root zone at different times during and after the growing season. A large, undisturbed field-drainage lysimeter was used to measure leaching of NO3(-)-N below the root zone. During spring 1973, 94 mm of drainage water containing a mean concentration of 2.4 ppm fertilizer-derived NO3(-)-N percolated through the soil profile. At crop maturity, only 55% of the N applied the previous spring was recovered by the crop or was present in drainage water. Large amounts of N not recovered by the crop were either measured as immobilized N (20% of the applied N) or were unrecovered and assumed denitrified (17%). During the fall and winter, approximately 120 mm of drainage water containing 0.5 ppm or less fertilizer-derived NO3(-)-N percolated through the soil profile. These results indicated that for rainfall conditions observed in this study (minimal crop water deficit), the application of N fertilizer to grain sorghum at the near-optimum economic rate probably would not seriously reduce groundwater quality on a swelling clay soil, even though crop recovery of applied N might be low.

Descriptors: Water quality, Prediction, *Model studies, *Mathematical models, Massachusetts, *Blackstone River basin(Mass-RI), Rhode Island, Management, Organic wastes, Coliforms, Distribution, Phosphates, Nitrogen, *Path of pollutants, River basins, Dissolved oxygen, Biochemical oxygen demand.

A one-dimensional numerical finite-difference model is developed for computing water quality parameters in a river basin. The model is then applied to the Blackstone River Basin between Auburn, Massachusetts and Central Falls, Rhode Island. The river is divided into 57 numerical segments of average length 4900 feet and average cross-section 500 square feet. Source loads are given for the various constituent discharges into the river. Computations are made for the distribution of dissolved oxygen, biochemical oxygen demand, total phosphates, ammonia nitrogen, nitrate nitrogen, total alkalinity, and total coliforms, for four different seasonal river volume flow rates. Good agreement is obtained for phosphate, nitrate, coliforms, and dissolved oxygen. Poorer agreement is found for ammonia, alkalinity, and BOD, the probable reason being lack of accurate source data. Some design calculations are shown for the effect of turbulent diffusion rate, decay coefficient, and improved sewage treatment on the distribution of water quality variables in the river.

INVESTIGATION OF BACTERIOLOGICAL POLLUTION OF RECREATIONAL WATERS IN ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management; and Arizona Univ., Tucson. School of Renewable Natural Resources.
G. S. Lehman, and M. M. Fogel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 779, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, August 1976. 3 p, 3 ref. OWRT A-053-ARIZ(3). 14-34-0001-6003.

Descriptors: *Water quality standards, *Arizona, *Bacteria, *Recreation, Lakes, Recreational facilities, Swimming, Water sports, *Bottom sediments, Lake sediments.

Identifiers: Recreational waters, *Bacteriological pollutions, Central Arizona, *Canyon Lake(Ariz).

Bacterial water quality was studied in a swimming area on Canyon Lake, Arizona. Water quality standards for bacteria were not exceeded early in the season, even when the facility was used at capacity. Some problems were encountered late in the season when the bacteria-laden bottom sediments were agitated by wind and wave action and/or when runoff producing storms occurred. Water currents, possibly unique to the area, provide a cleansing action that limited accumulation of undesirable quantities of bacteria in the water and sediment. Bacteria concentrations in the sediments remained at elevated levels for some time after the swimming season but decreased to the base level by the following spring.
W77-00153

AGRICULTURAL RUNOFF AS A SOURCE OF HALOMETHANES IN DRINKING WATER,
Iowa Univ., Iowa City. State Hygienic Lab.
R. L. Morris, and L. G. Johnson.
American Water Works Association Journal, Vol. 68, No. 9, p 492-494, September 1976. 4 tab, 1 ref.

Descriptors: *Agricultural runoff, *Chlorination, *Disinfection, *Iowa, *Water quality, *Organic compounds, Analytical techniques, Runoff, Agricultural watersheds, Surface runoff, Halogens, Bromine, Chlorine, Turbidity, Gas chromatography, Water treatment, Solvent extractions, Municipal water.
Identifiers: *Halomethanes, *Chlorination products, Farm runoff, Chlorine treatment, Chloroform, Carbontetrachloride, Chlorine demand, Volatile organics, Carcinogenic products, Powdered carbon, Halogenated methanes.

Data on various raw-water sources in Iowa were analyzed in relation to the finished waters produced from them; periods of high agricultural runoff were distinctly associated with peaks in halomethanes. Turbidity removal prior to chlorination was shown to be critical to minimize chloroform production during disinfection. Municipalities may be interested by the inexpensive new methodology developed to test for these substances, a current concern in the water-supply field. (Henley-ISWS)

SURFACE RUNOFF LOSSES OF FERTILIZER ELEMENTS,
Louisiana State Univ., Baton Rouge. Dept. of Agronomy; and Louisiana Agricultural Experiment Station, Baton Rouge.
E. P. Dunigan, R. A. Phelan, and C. L. Mondart, Jr.
Journal of Environmental Quality, Vol. 5, No. 3, p 339-342, 1976. 6 tab, 9 ref.

Descriptors: *Nitrogen compounds, *Phosphorus compounds, *Fertilizers, *Nutrient removal, *Agricultural runoff, *Louisiana, Nitrogen, Ammonia, Nitrates, Phosphates, Potassium compounds, Leaching, Potash, Runoff, Water quality, Water pollution, Analytical techniques, Surface runoff, On-site investigations.
Identifiers: Fertilizer elements, Surface runoff losses, Fertilizer nutrient losses, Nutrient transport, Nitrogen losses, Loring silt loam, Soluble nutrients, Analytical methods, Nitrogen transport, Phosphorus transport.

Surface runoff losses of fertilizer N, P, and K were measured from a Loring silt loam soil with an average slope of 5%. Plots seeded to pearl millet in 1973 an 1974 were fertilized at the rate of 112-49-93 kg/ha of incorporated N, P, and K using two different fertilizer blends, a 33.3-8.7-16.6 and an 8-3.5-6.6. The percent of water-soluble fertilizer elements lost in 1973 from the higher and lower blend concentrations, respectively, were N, 0.50 and 0.30%; P, 0.14 and 0.06% and K, 0.67 and 0.92%. In 1974, N losses were 0.89 and 0.41%; P, 0.35 and 0.20%; and K, 0.42 and 0.35%. Precipitation during the experimental periods was 20.40 cm in 1973 and 11.03 cm in 1974. Two of the millet plots were then topdressed with NH_4NO_3 fertilizer at the rate of 112 kg N/ha. Topdressed fertilizer-N losses were 2.68% in 1973 and 1.82% in 1974. Precipitation during these second tests was 27.97 cm in 1973 and 27.69 cm in 1974. Ryegrass plots were fertilized with sulfur-coated urea (SCU) and uncoated urea (U) at the rate of 224 kg N/ha during the growing seasons of 1973 and 1974. Total N losses (U vs. SCU) were 9.52 and 0.26% in 1973, and 1.67 and 0.42% in 1974. Precipitation was 23.89 cm in 1973 and 29.57 cm in 1974. A 10.08-cm rainfall on the third day of the test in 1973 caused almost three-fourths of the 9.52% N lost from the uncoated urea to be lost in that runoff and while it was still in the urea form. The sulfur coating prevented large surface losses of N from the SCU. (Henley-ISWS)

NITROGEN IN SUBSURFACE DISCHARGE FROM AGRICULTURAL WATERSHEDS,
Agricultural Research Service, Columbia, Mo.
R. E. Burwell, G. E. Schuman, K. E. Saxton, and H. G. Heinemann.
Journal of Environmental Quality, Vol. 5, No. 3, p 325-329, 1976. 4 fig, 3 tab, 15 ref.

Descriptors: *Nitrogen, *Subsurface runoff, *Agricultural watersheds, *Nutrient removal, *Nitrogen compounds, *Iowa, Fertilizers, Leaching, Nutrients, Analytical techniques, Percolation, Water quality, Groundwater, Nitrates, Soil erosion, Water pollution sources, Soil conservation, Runoff, Watersheds(Basins), Conservation, Sediment discharge.
Identifiers: Nutrient transport, Nitrogen losses, *Missouri Valley, Nitrogen fertilizers, *Nutrient loss, Soluble nutrients, Chemical fertilizers, Nitrogen transport, Analytical methods.

The nitrogen in subsurface discharge and surface runoff was measured from four agricultural watersheds on Missouri Valley deep loess near Treynor, Iowa, from April 1969 through March 1974. The data showed that, with the agricultural management practices used on the watersheds, the subsurface discharge of water ranged from 62 to 88% of the average annual stream flow. Nitrate in subsurface discharge accounted for 84 to 95% of the total average annual soluble N discharged in stream flow. A terraced watershed continuously cropped to corn had reduced surface runoff, sheet-rill erosion, and associated nitrate-nitrogen discharge, but had increased subsurface discharge of water and soluble N as compared with two contoured corn watersheds. Nitrogen fertilizer applied at a high rate (448 kg/ha/year) exceeding crop needs on the terraced and contoured corn watersheds, increased five- and threefold the average annual subsurface discharge of NO_3-N, respectively, as compared with a contoured watershed fertilized with N at a normal rate (168 kg/ha/year). Controlling the watershed discharge of N and subsequent pollution of stream flow from the Iowa and Missouri deep loess hills requires N fertilizer application rates that do not exceed crop needs and using conservation practices that minimize soil erosion and deep percolation. (Henley-ISWS)
W77-00166

MATHEMATICAL MODEL FOR PREDICTING THE CONSOLIDATION OF DREDGED MATERIAL IN CONFINED DISPOSAL AREAS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Soils and Pavements Lab.
L. D. Johnson.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-020 949, Price codes: A06 in paper copy, A01 in microfiche. Technical Report D-76-1, January 1976. 110 p, 14 fig, 5 tab, 51 ref, 3 append. DMRP Work Unit 2C08.

Descriptors: *Consolidation, *Dredging, *Floods, Disposal, Flow, Spoil banks, Soil, Mathematical models, Environmental effects, Seepage, Model studies.
Identifiers: *Dredged areas, *Disposal areas, Dredged material, Dredged spoil, Dredged material disposal, Containment areas, Soil permeability, Flow patterns.

A tentative procedure was suggested for the estimation of the volume-time relationships of dredged material in a flooded containment area based on simple sedimentation and consolidation theories. The procedure also included a method to compute the consolidation of the foundation soils by standard consolidation theory. Laboratory and field investigations were necessary to verify and to develop further the equations and procedures obtained during this study for estimating volume changes with time of various types of sediments accommodated in containment areas. These factors were investigated in subsequent Dredged Material Research Program studies in order to develop a complete methodology for determining the capacity of a containment area. (Roberts-ISWS)

COMPOSITIONAL CHANGES OF A FUEL OIL FROM AN OIL SPILL DUE TO NATURAL EXPOSURE,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
R. N. Young, and A. J. Sethi.
Water, Air, and Soil Pollution, Vol. 5, No. 2, p. 195-205, 1975. 4 fig., 4 tab., 15 ref.

Descriptors: *Oil pollution, *Beaches, *Weathering, Sands, *Canada, Analytical techniques, Reduction(Chemical), Soils, Aromatic compounds, Ethers, Oxidation, Water pollution effects, *Oil spills.
Identifiers: *Pearce Island(British Columbia), n-Paraffins, Sulfones.

On January 24, 1973, an ocean freighter carrying heavy fuel oil struck a reef in Queen Charlotte Strait, British Columbia. The resulting oil contamination of beaches on Pearce Island was kept in its original state except for time-lapse natural weathering. Oil was extracted with petroleum ether or carbon disulfide: acetone: methanol: the solvent mixture removed 4-5 times more oil. Gas liquid chromatography and infrared absorption were used to detect compositional changes. X-ray diffraction studies showed that the soil contained quartz, feldspar (both plagioclase and alkali), plus small amounts of hornblende and kaolinite; extraction of oil enhanced the intensity and sharpness of diffraction patterns. Gas liquid chromatography indicated that low molecular weight n-paraffins were lost during weathering. Aromatics had evaporated after one day of exposure. Infrared studies indicated ethers in all samples except the original oil sample and that sulfoxides had been oxidized to sulfones, due to an oxidation reaction resulting from natural exposure. Low molecular weitht n-paraffins were lost through formation of ether and sulfone groups. After a six-month exposure to physical weather stresses up to 4% of the fuel oil spilt and washed ashore was still retained in the soil material; about 3.5% remained after a year. (Buchanan-Davidson-Wisconsin).

COAST GUARD TRANSFER MONITORING PROGRAM,
Coast Guard, Washington, D. C. Marine Environmental Protection Div.
J. V. Leotta, and A. J. Taylor.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p. 45-51, 3 tab.

Descriptors: *Oil spills, *Oil pollution, *Monitoring, *Pollution abatement, Resources development, Water pollution, *Water quality control, Continental Shelf, Accidents, Personnel management, Washington, Coast Guard Regulations.
Identifiers: *Outer Continental Shelf, Petroleum, Puget Sound, Tankers, Loading, Fuel transfers.

Coast Guard monitoring of significant bulk petroleum transfers has a positive effect on the prevention of intentional and accidental discharges. The six month study placed Coast Guard personnel at the site of 90% of the major transfer operations occurring in the Puget Sound area. The monitors observed transfer operations to insure that all applicable regulations were being observed. Coast Guard personnel were able to develop expertise in petroleum transfer techniques and related environmental concerns involving the Coast Guard. The resulting degree of professionalism favorably affected other areas of Coast Guard involvement in water-front activities and provided a closer relationship with industry and a mutual appreciation of responsibilities. A marked decline in unknown source discharges indicated that monitoring was also effective in educating owners and operators of responsibilities in reporting discharges. The major benefit to industry was the assurance that its personnel were observing proper transfer procedures. In addition, training needs were more easily established, and the effectiveness of company training programs evaluated. Finally, employee morale improved with the realization of the importance and responsibility of their jobs. The establishment of a monitoring program nationwide is discussed. Insights gained in the Seattle effort are related to the implementation of an effective discharge prevention program with a minimal burden on industry. (See also W76-09312) (Sinha-OEIS)
W77-00204

THE VISIBILITY OF OIL-WATER DISCHARGES,
National Environmental Research Center, Edison, N. J. Edison Water Quality Research Div.
B. Hornstein.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 91-99, 2 fig, 8 tab, 8 ref.

Descriptors: *Oil spills, *Oil pollution, Water pollution, *Water quality control, *Monitoring, Discharge measurement, Films, Reflectance.
Identifiers: *Outer continental shelf, *Visibility, Detection, Oil-water mixtures, Interference color effects, Raritan Bay(NJ).

Controlled oil films from 15 through 3000 nanometers (3 microns) thick show reflectance and interference color effects that vary in an orderly way with film thickness. Visibility of a given film is variable and is affected by ambient factors that include sky conditions, water surface state, and the depth and color of the water. Controlled streams of 25 to 100 gpm, containing 5 to 250 ppm of oil, were discharged into Raritan Bay from a 65-foot vessel. Discharge points were above the surface or 2 to 5 feet below the surface, with the vessel an anchor in tidal currents, simulating a fixed source in a low current. Above-surface discharges were also made with the vessel underway at 6 to 15 knots. The visibility and appearance of films resulting from the discharges were recorded from the vessel and from a helicopter. The visibility of above-surface discharges for all combinations of water rate, oil content, and vessel speed, is correlated by a Specific Oil Rate (SOR) parameter. Results of discharges reported by the Coast Guard for vessel speeds of 10-17 kt and by the British for 8-16 kt correlate with ours via the SOR parameter. These observations were also from aircraft. Subsurface discharges appeared substantially less visible than corresponding above surface discharges. Replication, however, was insufficient to allow development of a correlation. LABORATORY AND FIELD TESTING OF SURFACE-FILM FORMING CHEMICALS FOR USE AS OIL COLLECTING AGENTS,
Naval Research Lab., Washington, D. C.
W. R. Barger.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 241-246, 3 fig, 5 tab, 9 ref.

Descriptors: *Oil spills, *Water pollution sources, *Oil pollution, *Water quality control, Testing.
Identifiers: *Outer Continental Shelf, *Oil recovery, Chemical treatment, Surface film, Collecting agents.

Forty-seven commercially available chemicals capable of controlling oil were examined in the laboratory during 1971 to determine which were practical oil collecting agents. A series of screening tests was developed, based upon physical properties and surface-chemical properties. The materials judged to be most useful by these tests are presently being evaluated in multicomponent field tests of oil recovery equipment. Both laboratory and field tests have indicated that such materials can aid in cleaning up spilled oil. (See also W76-09312) (Sinha-OEIS)

FACTORS GOVERNING THE FATE OF OIL AT SEA; VARIATIONS IN THE AMOUNTS AND TYPES OF DISSOLVED OR DISPERSED MATERIALS DURING THE WEATHERING PROCESS,
Exxon Research and Engineering Co., Linden, N.J.
J. W. Frankenfeld.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 485-495, 8 fig, 10 tab, 13 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Environmental effects, *Dispersion, *Water pollution sources, *Weathering, Organic compounds, Oxidation.
Identifiers: *Outer Continental Shelf.

An important part of the weathering process is the dissolution or dispersion of organic compounds in the aqueous phase in contact with the oil slick. Some of the factors influencing the amounts and types of compounds found in the water extracts from several crude and refined oils have been investigated. The most important influences appear to be the characteristics of the original oil and the effects of oxidation. The total soluble oil, as measured by partitioning experiments was 4-20 times that actually found after the system was opened to the atmosphere. After about a week's weathering in laboratory simulators, the dissolved organic contents ranged from 3 ppm for a light fuel oil to about 0.5 ppm for crudes and heavy fuels. The prevalent compounds in the aqueous extracts of a crude and a light fuel oil have been investigated using high resolution mass spectroscopy. These

are mostly medium molecular weight aromatics and oxygenated aromatics. The oxygenates appear to be largely alcohols and ethers possibly produced by light catalyzed oxidation during weathering. (See also W76-09312) (Sinha-OEIS)

DISTRIBUTION OF HEAVY HYDROCARBONS IN SOME ATLANTIC OCEAN WATERS,
Exxon Research and Engineering Co., Linden, N.J.
R. A. Brown, T. D. Searl, J. J. Elliott, B. G. Phillips, and D. E. Brandon.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 505-519, 10 fig, 6 tab, 14 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, Atlantic Ocean, Caribbean Sea, Gulf of Mexico, Sea water, Testing, Sampling, *Path of pollutants.
Identifiers: *Outer Continental Shelf, Hydrocarbons, U.S. East Coast, U.S. Gulf Coast.

During 1971-72 ocean water samples were collected off tankers along two well traveled routes, including: U.S. Gulf Coast to East Coast and Caribbean to East Coast. Approximately 400 samples were taken near the surface and at a depth of about 10 meters. At the time of collection, each sample was extracted with carbon tetrachloride. The extract was subsequently analyzed for hydrocarbon content and, in many cases, the hydrocarbons were characterized as to compound types. Nonvolatile or persistent hydrocarbons were found to be generally in the concentration range of .001 to .012 ppm (wt.). Some variations in the amount and composition were observed according to geographical location of the sample. Sampling and analysis methods are briefly described. The data presented here show that the hydrocarbons in the sea derived from whatever source are extremely low. The data further suggest that the hydrocarbons were derived at least in part from petroleum. There are variations in the amount and composition of the hydrocarbons within the sea water system, and more detailed study may well define the sources and ultimate fate of hydrocarbons in the sea. PREDICTION OF OIL SLICK MOTIONS IN NARRAGANSETT BAY,
Rhode Island Univ., Kingston. Dept. of Mechanical Engineering and Applied Mechanics.
J. Premack, and G. A. Brown.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 531-540, 11 fig, 3 tab, 11 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Pollution abatement, *Water pollution, Estuaries, Planning, Rhode Island, *Path of pollutants.
Identifiers: *Outer Continental Shelf, Narragansett Bay(RI), Prediction.

A comparison of the calculated size and arrival times for the P.W. Thirtle oil spill with existing data indicate that the oil spill motion simulation can assist the oil contigency planner significantly in estimating the size and arrival times of an oil spill in a tidal estuary. The assumption that a 24,000 barrel spill can be simulated by the independent spreading and drifting of 12 hourly spills, each of 2,000 barrels, is at best a crude one. However, based on the evidence of this particular study it appears to be accurate enough for contingency planning purposes. However, additional analytical work should be done to permit a more physically correct modeling of the process. (See also W76-09312) (Sinha-OEIS)

RETENTION OF ARSENIC BY HYDROXY-ALUMINUM ON SURFACES OF MICACEOUS MINERAL COLLOIDS,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
P. M. Huang.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 271-274. March-April 1975. 2 fig, 5 tab, 19 ref.

Descriptors: *Soil chemistry, *Arsenic compounds, Soil properties, Soil investigations, Soil chemical properties, Colloids, Ions, Geochemistry.
Identifiers: *Arsenic, Biotite, Musconite, Miceovs mineral colloids.

This study was carried out to examine the relative significance of as retention by hydroxy-Al on external and interlamellar surfaces of micaceous mineral colloids. Depletion of K from muscovite and biotite decreased as retention. This effect was attributed to the exclusion of arsenate ions by the K-depleted layers. Hydroxy-Al in the interlamellar spaces of vermiculite and K-depleted micas was not found to contribute significantly to as retention in the solution concentration range of 2 to 10 ppm as. EFFECT OF ANION EXCLUSION ON THE MOVEMENT OF CHLORIDE THROUGH SOILS,
Chile Univ., Santiago. Facultad de Ciencias Quimicas.
H. Appelt, K. Holtzclaw, and P. F. Pratt.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 264-267, March-April 1975. 2 fig, 4 tab, 14 ref.

Descriptors: *Soil chemistry, *Chlorides, *Soil chemical properties, Soil investigations, Soil properties, *California, *Cation exchange, Geochemistry.
Identifiers: *Anion exclusion, Chloride movement.

The effects of anion exclusion on the movement of chloride through soils were studied using a variety of subsurface soil samples from southern California. The data reported suggest that the nature of the clay mineral, clay content, saturation percentage and iron oxide content together with the cation-exchange capacity are important sol characteristics related to the volume of exclusion. General equations that are based only on specific charge seem to be oversimplifications. Another serious limitation of general equations obtained under laboratory conditions is their extrapolation to field conditions. The high variability regarding salt distribution commonly found in the field makes the use of correction factors, such as volume of exclusion, of limited value. More studies under field conditions are necessary before quantitative predictions can be made using general equations obtained with disturbed soil samples in the laboratory. (Skogerboe-Colo St)

M. S. Yee, H. L. Bohn, and S. Miyamoto.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 268-270. March-April 1975. 5 fig, 3 tab, 14 ref.

Descriptors: *Sorption, *Sulfur, *Sulfur compounds, *Calcareous soils, Soil chemistry, Soil chemical properties, Pollutants, Soil moisture.
Identifiers: *Sulfur dioxide.

The capacities and rates of calcareous soils to sorb SO2 were measured by a steadystate method in which a stream of air plus SO2 passed rapidly through the soil. At room temperature, air-dry calcareous soils were saturated with SO2 within 10 to 15 min from a dry gas stream. The sorption capacities, 0.4 to 1.6 g of S/100 g of soil at 0.34% SO2 in air, increased with SO2 concentration and specific surface of the soils. Moisture in the air and/or soil increased the SO2 sorption capacities to 0.8 to 6 g of S/100 g, approximately equivalent to the acid titratable basicities, but saturation required several hours. The initial sorption rate ranged from 0.06 to 0.29% S/min in the moist soils. (Skogerboe-Colo St)

RELATIONSHIPS BETWEEN SORPTION AND DESORPTION OF PHOSPHORUS BY SOILS,
International Inst. of Tropical Agriculture, Ibadan (Nigeria).
J. C. Ballaux, and D. E. Peaslee.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 275-278, March-April 1975. 1 fig, 7 tab, 22 ref.

Descriptors: *Sorption, *Phosphorus, *Soil properties, Soil investigations, Soil chemistry, Soils, *Kentucky.
Identifiers: *Desorption.

Relationships between the sorption and desorption of P were investigated for five soils ranging in clay content from 16 to 51%. Langmuir adsorption isotherms for some soils were curvilinear when the P concentration in the equilibrium solution was >10 micro-g/ml. To evaluate sorption at higher concentrations of P, values of adsorption maxima (b) and indices of bonding energy (k) were estimated from tangents to six segments of each isotherm. Within each soil, the six pairs of b and k values were related according to the equation k=(a/b)(n), where n was a unique characteristic for each soil. (Skogerboe-Colo St)

K. R. Reddy, and W. H. Patrick, Jr.
Soil Biology and Biochemistry Vol. 7, No. 2, p 87-94, March 1975. 6 fig, 1 tab, 25 ref.

Descriptors: *Aerobic conditions, *Anaerobic conditions, Organic matter, *Decomposing organic matter, Nitrogen, Nitrates, Denitrification, *Oxidation reduction potential, Flooding, Saturated soils.
Identifiers: *Nitrogen loss(Soils).

The effect of several cycles of varying length of alternate aerobic and anaerobic conditions on redox potential, organic matter decomposition and loss of added and native nitrogen was investigated under laboratory conditions in flooded soil incubated for 128 days. Redox potential decreased rapidly when air was replaced with argon for the short-time cycles, but decreased more slowly where the aerobic period was long enough to permit build-up of nitrate. The minimum redox potential reached during the anaerobic period was generally lower for the longer cycles, but in all cases was low enough for denitrification to occur. Rate of decomposition of organic matter was faster in the treatments with a greater number of alternate aerobic and anaerobic periods. (Skogerboe-Colo SU)

CHLORINATED HYDROCARBON PESTICIDES IN WESTERN NORTH ATLANTIC OCEAN,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
R. B. Jonas, and F. K. Pfaender.
Environmental Science and Technology, Vol. 10, No. 8, p 770-773, August, 1976. 2 fig, 1 tab, 12 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Atlantic Ocean, *Water pollution, Waste dilution, *DDE, *Dieldrin, Aldrin, DDD, DDT, Pesticides, Water pollution sources, Oceans, Halogenated pesticides, Organic pesticides, *Distribution patterns, Insecticides, Pollutants, *Path of pollutants.
Identifiers: *Lindane(Gamma-hexachlorocyclohexane).

Both 1,1-bis-(p-chlorophenyl)-2,2-dichloroethylene (DDE) and dieldrin (1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo-exo-5,8-dimethano-naphthalene) were detected in the offshore waters of the western North Atlantic Ocean from the surface to 1000 m depth. The mean concentrations of the two pesticides are 3.8 (DDE) and 5.8 (dieldrin) parts per trillion (ng/liter). Other chlorinated pesticides, including lindane, aldrin, 1,1-bis-(p-chlorophenyl)-2,2-dichloroethane (DDD), and DDT, could not be detected at most sample sites by currently available analytical techniques. The data suggest that considerable variability, both with depth and distance from shore, is a dominant feature of the distribution of chlorinated pesticides in the North Atlantic Ocean. Concentrations of DDE and dieldrin range from 0.1 to 18.1 and 0.4 and 19.4 ng/liter, respectively. The observed environmental distribution of these pesticides would be consistent with a hypothesis of uptake and transport of these compounds on particulates in the sea. (Witt-IPC)

K. Botzenhart, R. Wolf, and E. Thofern.
Zentral Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med 161(1), p 72-83, 1975.

Descriptors: *Cooling water, Water pollution, Thermal pollution, Sewage, Biological treatment, Pseudomonas, *Aerobic bacteria, Microorganisms.
Identifiers: *Pseudomonas-aeruginosa.

The occurrence and numerical behavior of P. aeruginosa in natural waters with and without waste water contamination, in dams, cooling water circulation systems and cooling water discharge, in clarification plant and supplementary laboratory tests are reported. P. aeruginosa may occur in the natural flora of open waters, but only following the introduction of human sewage. A rapid reduction of the number of P. aeruginosa to low levels generally occurs over periods of several days to several weeks. In the presence of large quantities of nutrient, multiplication of P. aeruginosa in natural waters is possible. It appears in technical systems such as cooling water circuits and filter plants. P. aeruginosa probably also multiples in waste water; in the biological aerobic clarification process a reduction occurs. The effect of higher temperature on the survival or multiplication of P. aeruginosa was not confirmed by laboratory experiments.--Copyright 1975, Biological Abstracts, Inc.

SEABED DRIFTER MOVEMENT IN SAN DIEGO BAY AND ADJACENT WATERS,
Naval Undersea Center, San Diego, Calif.
R. R. Hammond.
Available from the National Technical Information Service, Springfield, VA, 22161, as AD-A022 604, Price codes: A04 in paper copy, A01 in microfiche. Report NUC TP 507, February 1976. 55 p, 9 fig, 8 tab, 34 ref, 2 append.

Descriptors: *Water circulation, *Path of pollutants, *Estuaries, *Harbors, *California, Tides, Circulation, Bays, Sediment transport, Currents(Water), On-site investigations, Coasts, Shores, Pollution, Water pollution control, Pollution abatement.
Identifiers: *San Diego Bay(Calif), Bottom water movement, Seabed drifters, Tidal flushing, Drifters.

Of vital importance in achieving effective control of pollution in estuaries near dense population centers is a detailed knowledge of the water circulation and flushing mechanisms. Although several experimental and hydrodynamic-numeric studies have been made of the San Diego estuarine system, no information existed on net bottom water movement which affects the flushing of solid waste and sediment transport. Since the seabed drifter has been used successfully to provide valuable information in many estuarine and open sea environments, it was selected for use in the San Diego area. Five hundred drifters were released in the bay and adjacent ocean waters to delineate bottom flow patterns. Four significant bottom drift regimes were discussed: off coastal, main bay channel, open bay, and semi-enclosed docking basins. Mean residual bottom drift ranged from 0.17 kilometers per day off the coast to essentially zero in the docking basins. This compared favorably with results of similar studies of other California estuarine systems. Contrary to expectations, off coast drifter results (31% recovery) showed a persistent north moving bottom current with shallow near coast drift distances between 4 and 25 kilometers. In the open bay a reverse trend was observed from the 16% of the drifters recovered. At the head of the estuary, evaporative densification was believed to occur, with the heavier water sinking and moving outward toward the estuary mouth, resulting in an area of opposing bottom water currents. COLIFORM BACTERIA FROM DIFFUSE SOURCES AS A FACTOR IN ESTUARINE POLLUTION,
Smithsonian Institution, Edgewater, Md. Chesapeake Bay Center for Environmental Studies.
M. A. Faust.
Water Research, Vol. 10, No. 7, p 619-627, 1976. 3 fig, 5 tab, 35 ref.

Descriptors: Coliforms, *Bacteria, *Water pollution sources, *Estuarine environment, *E. Coli, *Chesapeake Bay, Sewage bacteria, Water quality, Estuaries, Pollutants, Runoff, Agricultural runoff, Surface runoff, Watersheds(Basins), Nitrates, Phosphorus, Microorganisms, Livestock, *Maryland.
Identifiers: *Coliform bacteria, *Estuarine pollution, *Fecal coliform, *Diffuse pollution sources, *Estuarine ecosystems, *Rhode River(Md), Bacterial pollution, Bacterial analyses, Total

phosphorus, Rural watershed, Coliform discharge, Fecal pollution.

The contribution of 849 ha of rural watershed to the fecal coliform (FC) pollution of the Rhode River, a subestuary of Chesapeake Bay with a surface area of 485 ha, was estimated. The watershed with an animal population of 0.6 animal unit/ha discharged between 7,500,000 and 669,000,000 FC/ha-day. The FC discharge rate was seasonal and largely dependent upon the water flow. Total coliform (TC) discharge was influenced by the same factors as the FC discharge. It was calculated that, on the average, less than 1% of FC produced by the animals on the land was washed down by water runoff. Occasionally the FC discharge rate in the runoff reached 4-6% of the FC produced by the animals. Fecal coliforms persisted in the water. The FC numbers were high in the Rhode River close to the discharge points, and further away the FC numbers were diluted by the river volume. It was estimated, using the maximum number of FC in the runoff, that 2600 cu m of well mixed receiving water was needed for every ha of watershed area not to exceed the safe water standards (14 FC MPN/100 ml) for shellfish harvesting. Three factors having a role in FC pollution of an estuarine ecosystem were emphasized as a result of this study: (1) the rural watershed contributed substantial quantities of FC to the estuary; (2) the season of the year may determine the level of pollution entering from rural sources into the estuary; (3) the persistence of bacteria in the estuary may increase the pollution level contributed by the watershed, especially at low water temperatures. NITROGEN IN SOIL CORES AND GROUND WATER UNDER ABANDONED CATTLE FEEDLOTS,
Agricultural Research Service, Lincoln, Nebr. Animal Waste Management Research Unit.
L. N. Mielke, and J. R. Ellis.
Journal of Environmental Quality, Vol. 5, No. 1, p 71-75, January-March 1976. 5 fig, 2 tab, 17 ref.

Descriptors: *Nitrates, *Nitrogen, *Feed lots, *Soil contamination, Water pollution sources, *Groundwater, Soils, Crops Farm management, Soil chemistry, Cores, Pollutants, Pollutant identification, Agriculture, Farm wastes, Cattle, Livestock, Confinement pens, Wastes.
Identifiers: *Abandoned feed lots.

Soil core samples from four abandoned beef cattle feedlots were analyzed to determine their chemical and physical characteristics. These cores were compared with those from active upland, intermittantly used feedlots, and croplands. The nitrate-nitrogen (NO3-N) in the abandoned feedlots averaged 7,200 kg/ha in a 9.1-m soil core, while the active upland, intermittently used feedlot, and cropland averaged 1,800, 2,100, and 570 kg/ha NO3-N, respectively. The abandoned feedlot core with the highest NO3-N had 18,200 kg/ha in a 9.1-m core. Nitrate-N levels in an abandoned feedlot after 15 years of corn-alfalfa rotation were comparable with cropland cores. Groundwater samples obtained from three of the four abandoned feedlots contained 77.2, 43.7, and 0.6 ppm NO3-N. (Sims-ISWS)

GEOLOGIC NITROGEN IN PLEI)CENE LOESS IN NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Agronomy.
J. S. Boyce, J. Muir, A. P. Edwards, E. C. Seim, and R. A. Olson.
Journal of Environmental Quality, Vol. 5, No. 1, p 93-96, January-March 1976. 3 fig, 1 tab, 15 ref.

Descriptors: *Nitrogen, *Nitrates, *Soil contamination, *Nebraska, *Soils, *Loess, Fertilization, Fertilizers, Agricultural chemicals, Water pollution, Leaching, Irrigation, Cores, Soil chemical properties, Geology, Limestones, Shales, Groundwater.

Research into the relationship between fertilizer use and water quality in Nebraska has resulted in the discovery of large quantities of geologic nitrate within the deep loess mantle of southwestern and central Nebraska. The N03(-) was first encountered at a depth of about 7 m and continued to an unknown depth in excess of 30 m. Nitrate-N values of 25 to 45 ppm characterized the N zone, but values to 87 ppm have been recorded. The N03(-) existed only under the more level uplands of the region; however, it is on this plain that rapid development of irrigation is taking place, and it has been shown that the N03(-) has been leached from beneath older irrigation sites on the plain. Water Resources Research, Vol. 12, No. 4, p 655-666, August 1976. 13 fig, 3 tab, 22 ref.

Descriptors: *Dispersion, *Flow, *Turbulence, *Channel morphology, *Hydrologic data, Velocity, Methodology, Tracers, Distribution patterns, Statistical methods.
Identifiers: Self-similar process, Concentration-time diagram, Dispersing cloud, Channel geometry.

The longitudinal dispersion in natural river channels was shown to exhibit the characteristics, constant velocity ratios, and similarity in the distribution of physical dimensions of a self-similar process. Although the kinematic relations and the structure of the turbulent field were sensitive to the nature of the flow boundaries and the geometry of the channel, similarity was maintained in flows in a wide range of steep gravel and boulder bed channels. A simple method was developed for predicting the longitudinal pattern of dispersion. It contained three basic hydraulic parameters which could be determined by a field experiment. Data on steep channels and distances up to 1000 channel widths from the dump point were used in developing the method. Though these data were rather limited in scope, the results suggested that the general method may be applicable to streams with a range of characteristics. (Singh-ISWS)

MEASUREMENTS OF ESTUARY DISPERSION COEFFICIENTS,
Rhodesia Univ., Salisbury. Dept. of Civil Engineering.
P. R. B. Ward.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE4, Technical Note, p 855-860, August 1976. 1 fig, 1 tab, 10 ref, 2 append.

Descriptors: *Dispersion, *Rhodamine, *Estuaries, *Saline water intrusion, *Tidal effects, On-site tests, Dye dispersion, Velocity, Equations, Travel time, Sampling, *Path of pollutants, *Canada.
Identifiers: *British Columbia, *Fraser estuary(BC), Tidal flow.

Measurements of the dispersion of dye clouds from point sources were made in the Fraser estuary located in British Columbia. This estuary is typical of several large estuaries in that area, and it i characterized by conditions of large tidal rang and large freshwater discharge. A salt water wedg penetrates the estuary for several miles durin flood tidal flows, provided the freshwate discharge is not close to its maximum. On-site ex periments were conducted to ascertain the disper sion characteristics of dye clouds for the followin conditions: (1) small river discharge and large tid flow seawards, and (2) medium river discharge an small tidal flow seawards. The values of th dimensionless transverse dispersion coefficient determined from these experiments were withi the range of values measured in laboratory exper ments for tidal flows in meandering channels. Th transverse mixing was not nearly completed in th duration of the experiment, and the dispersion c the dye cloud was not affected by zones of lo velocity near the edges of the channel. (Singh ISWS)

TRANSPORT OF CARBON14-ASSIMILATES IN THE SUGAR BEET UNDER DIFFERENT CONDITIONS OF NUTRITION AND MOISTURE, (IN RUSSIAN),
Kirgiz State Univ., Frunze (USSR).
V. A. Pechenov.
Fiziol Biokhim Kul't Rast. 7(3), p 286-290, 1975.

Descriptors: *Sugar beets, *Productivity, *Soil moisture, *Nutrient requirements, Nitrogen, Potassium, Phosphorus, Path of pollutants, Radioactivity.
Identifiers: *Carbon-14.

Total radioactivity of all organs in sugar beet which were given N, P and K was sometimes as high as that in the plants which were not given the minerals. The outflow rate of assimilates increased with the age of plants and particularly in the period intensive accumulation of sugar. Optimization of soil moisture conditions favored a considerable intensification of the assimilate transport into the storage organs. Conditions of mineral nutrition and soil moisture changed the direction of labeled C incorporation into different fractions of organic substances. With rational treatment and optimization of the water regime, the outflow of assimilates into the root crop intensified, the percentage of 14C incorporation into sugars increased and the yield of sugar per unit of the sowing area increased.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Microbial degradation, Recreation, *Self-purification, Basins, *Bacteria, *Viruses, Water pollution, Public health, *Human diseases.

Increasing microbial contamination of water basins, its causes and its role in spreading bacterial and viral intestinal diseases are discussed. The significance of microbial contamination in direct short or long term recreational contact of the population with water of basins is shown; development of recreation institutions for long-term rest near water basins is discussed. Self-cleaning of water basins (microbial, chemical and thermal pollution, correlation between health-important microflora, pathogenic enterbacteria and viruses) is elucidated. The barrier role of existing waterpipe systems with respect to chemical pollutants and pathogenic microflora is discussed. Tasks facing hygienists under conditions of increasing microbial contamination of water basins are stated.--Copyright 1976, Biological Abstracts, Inc.

FATE OF SELECTED ORGANIC COMPOUNDS IN THE DISCHARGE OF KRAFT PAPER MILLS INTO LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington, (Ontario).
M. E. Fox.
In: Identification and Analysis of Organic Pollutants in Water (Keith, L. H., editor), Ann Arbor Science Publishers, Ann Arbor, Michigan, p 641-659, 1976. 7 fig, 9 tab, 7 ref.

Descriptors: *Pulp wastes, *Lake Superior, *Organic compounds, Wastes, Industrial wastes, Water pollution sources, Biota, Fish, Water pollution effects, Pollutants, Water pollution, Lake sediments, Waste dilution, Sediments, Persistence, *Path of pollutants, *Canada.
Identifiers: Nipigon Bay, Nipigon Strait, Kraft mills, Dehydroabietic acid, Resin acids.

Of the 35 identified organic compounds which are dispersed by the effluent plume of a kraft bleached pulp mill into Nipigon Bay, only dehydroabietic acid persisted in the water column. Whether the detected concentrations could cause sublethal effects in lake biota, such as fish tainting, is unknown. Dissipation of organics by dilution with receiving waters appears to be the principal short-term mechanism. Surface sediments contained elevated dehydroabietic acid levels, clearly originating from the discharge. The movement of this material follows the deep channel toward Nipigon Strait and was measured at almost 10 times the Bay's background level at a distance of 15 km from the effluent discharge. (See also W77-00455) (Brown-IPC)

PERSISTENT ORGANIC COMPOUNDS FROM A PULP MILL IN A NEAR-SHORE FRESHWATER ENVIRONMENT,
Canada Centre for Inland Waters, Burlington, (Ontario).
B. Brownlee, and W. M. J. Strachan.
In: Identification and Analysis of Organic Pollutants in Water (Keith, L. H., editor), Ann Arbor Science Publishers, Ann Arbor, Michigan, p 661-670, 1976. 1 fig, 3 tab, 6 ref.

Descriptors: *Pulp wastes, *Organic compounds, *Lake Superior, Wastes, Waste dilution, Industrial wastes, Water pollution sources, Great Lakes, Lake Sediments, Organic wastes, Water pllution, freshwater, Discharge(Water), Effluents, Organic acids, Persistence, Sediments, *Path of pollutants, *Canada.
Identifiers: Nipigon Bay, Dehydroabietic acid, 7-keto-dehydroabietic acid, Palmitic acid, Dioctyl phthalate, Acetovanillone, Sandaracopimaric acid, Kraft mills, Resin acids, Fatty acids.

A 25 sq km section of Nipigon Bay on the North shore of Lake Superior was sampled for organic compounds which could have entered the receiving waters from a kraft mill discharge site. Tentative conclusions reached from the findings are as follows: The effluent is a significant source of dehydroabietic acid, some of which enters the bay in particulate form; this acid is quite persistent in the water column, being found in surface sediments in significant amounts 1 km from the plume outfall. Likewise persistent were palmitic acid and dioctyl phthalate. Moderately or slightly persistent were acetovanillone, sandaracopimaric acid, and 7-keto-dehydroabietic acid. THE VIEW OF THE PAPER INDUSTRY ON THE OCCURRENCE OF PCB'S IN THE ENVIRONMENT AND THE NEED FOR REGULATION,
Container Corp. of America, Carol Stream, Ill.
P. E. Trout.
In: National Conference on Polychlorinated Biphenyls, November 19-21, 1975, Chicago, Illinois, U.S. Environmental Protection Agency, Office of Toxic Substances (Washington, D.C. 20460), Report No. EPA-560/6-75-004, p 359-361, March 1976. 3 ref.

Descriptors: *Pulp and paper industry, *Polychlorinated biphenyls, *Aroclors, *Water pollution sources, *Legislation, Environment, Pollutants, Wastes, Industrial wastes, Chemical wastes, Organic compounds, Aromatic compounds, Chemicals, Regulation, Toxicity, Persistence, Costs.

On behalf of the American Paper Institute and the Container Corporation of America, the author put forth and justified the following 4 statements: The paper industry does not use or introduce polychlorinated biphenyls (PCB's) into the environment but rather recirculates those already present which are unavoidably included in its manufacturing output. The PCB recirculated by the paper industry (Aroclor 1242) is not found to accumulate in animals, man, or the environment. Current levels of dietary intake are many orders of magnitude lower than the daily intake allowable according to the Food and Drug Administration. Any additional regulatory controls should aim at maximum environmental cost effectiveness. (See also W77-00460) (Brown-IPC)

STATEMENT RELATING TO POLYCHLORINATED BIPHENYLS ON BEHALF OF THE WISCONSIN PAPER COUNCIL,
Bergstrom Paper Co., Neenah, Wis.
J. S. Haney.
In: National Conference on Polychlorinated Biphenyls, November 19-21, 1975, Chicago, Illinois, U.S. Environmental Protection Agency, Office of Toxic Substances, (Washington, D.C. 20460), Report No. EPA-560/6-75-004, p 362-364, March 1976.

Descriptors: *Polychlorinated biphenyls, *Aroclors, *Pulp and paper industry, *Legislation, Biodegradation, Pollutants, Wastes, Industrial wastes, Water pollution sources, Recycling, Organic compounds, Aromatic compounds, Chemical wastes, Toxicity, Persistence, Wisconsin.
Identifiers: *Wisconsin Paper Council, Carbonless paper(No-carbon copying paper), Waste paper, Copying paper.

Only a small fraction of domestically produced polychlorinated biphenyls (PCB's) has been used in making carbonless copying paper. The Aroclors involved are less stable, less persistent, less susceptible to accumulation in fish, and more biodegradable than their more highly chlorinated

relatives. The impact of the waste paper recycling industry on the PCB issue should be put into a more positive perspective. PCB's cannot be legislated out of paper-recycling systems. Proposed regulations should be realistic, reasonable, feasible, and responsible. (See also W77-00460) (Brown-IPC)

NITRATE REDUCTION AND NITRITE UTILIZATION BY NITRIFIERS IN AN UNSATURATED HANFORD SANDY LOAM,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
M. G. Volz, L. W. Belser, M. S. Ardakani, and A. D. McLaren.
Journal of Environmental Quality, Vol. 4, No. 2, p 179-182, April-June 1975. 2 fig, 2 tab, 20 ref.

Descriptors: *Nitrates, *Nitrites, *Soil investigations, *Nitrification, Soil environment, Soil management, Agriculture, Soils, Loam, Microbiology, California, Soil analysis, Path of pollutants, Water pollution control.
Identifiers: *Microbial ecology.

In order to discern any relationship between added nitrate and microbial growth in a field plot, a Hanford sandy loam was infiltrated for 5 weeks at a rate of 5 cm/day with a solution containing 100 ppm-N and 1.25 meg/liter C1(-) KNO(3) and CaC1(2) respectively. Nitrate -N, NO(2)(-)-N and C1(-) concentrations in soils solution were determined and corresponding counts of nitrate reducers, denitrifiers, and NH(4)(+)- and NO(2)(-)-oxidizer populations were made. Ratios of measured to applied concentrations for both NO(3)(-)-N and C1(-) were nearly identical in all solution samples taken from the unsaturated soil profile, i.e., nitrate reduction was not pronounced and NO(2)(-)-N was less than 1 ppm. (Skogerboe-Colorado State)

GROUND-WATER QUALITY IN THE DAVIE LANDFILL, BROWARD COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. C. Mattraw, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 522, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 76-56, June 1976. 29 p, 7 fig, 11 tab, 4 ref.

Descriptors: *Water pollution sources, *Path of pollutants, *Groundwater movement, *Waste disposal, Septic tanks, Sewage lagoons, Landfills, Oil, Incineration, Water quality, Chemical analysis, Bacteria, Nitrogen, Sodium, Aquifers, *Florida, Pollutant identification, Coliforms.
Identifiers: *Broward County(Fla).

Ground-water adjacent to a disposal pond for septic tank sludge, oil, and grease at the Davie landfill, Broward County, Florida was tested for a variety of ground-water contaminants. Three wells adjacent to the disposal pond yielded water rich in nutrients, organic carbon and many other chemical constituents. Total coliform bacteria ranged from less than 100 to 660 colonies per 100 milliliters in samples collected from the shallowest well (depth 20 feet). At well depths of 35 and 45 feet bacterial counts were less than 20 colonies per 100 milliliters or zero. Concentrations of several constituents in water samples collected from the wells downgradient from the landfill, disposal pond, and an incinerator wash pond were greater than in samples collected from wells immediately upgradient of the landfill. A comparison of sodium-chloride ion ratios indicated that downgradient ground-water contamination was related to the incinerator wash water pond rather than the septic tank sludge pond. (Woodard-USGS)

MODELING OF THE TRANSFORMATION OF NITROGEN COMPOUNDS IN A CLOSED AQUATIC CHEMICAL-ECOLOGICAL MICROSYSTEM, (IN RUSSIAN),
A. V. Leonov, and T. A. Aizatullin.
Ekologiya. 6(2), p 5-10, 1975.

Descriptors: *Mathematical models, *Ecosystems, Aquatic environment, *Nitrogen compounds, Chemical degradation, Lakes, Waste water treatment, Ecological distribution, *Path of pollutants, Organic compounds.
Identifiers: *Heterotrophs, *Chemoautotrophs.

A mathematical model of a closed chemical-ecological microsystem responsible for transformation of N compounds in an aquatic environment is presented. The model reflects the dynamics of heterotrophs, chemoautotrophs, N-containing compounds, NH3, NO2, NO3 and 02. The model satisfactoriy describes experimental data on the dynamics of the system's components in lake and wastewaters. It can serve as the basis for a model of a real ecological macrosystem.—Copyright 1976, Biological Abstracts, Inc.

ENVIRONMENTAL IMPACT OF CADMIUM AND OTHER HEAVY METALS FROM LAND-APPLIED SEWAGE SLUDGE,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. R. Keeney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 643, Price codes: A03 in paper copy, A01 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report WIS WRC-76-03, July, 1976. 31 p, 11 tab, 29 ref. OWRT A-065-WIS(1). 14-31-0001-5050, 14-34-0001-6052.

Descriptors: Metals, *Public health, *Toxicity, *Sludge disposal, *Municipal wastes, *Soil contamination, Chemical properties, *Wisconsin, *Heavy metals, *Cadmium, Environmental effects, Sewage sludge, Soil profiles.
Identifiers: *Casco(Wis), *Monroe(Wis), *Beloit(Wis), *Chippewa Falls(Wis), Janesville(Wis).

Median Cd concentration in fertilizers (primarily P-containing materials) was about the same as in wastewater sludges in Wisconsin. The estimated Cd addition to soils from fertilizers was 2,150 kg, while sludges could add about 1,700 kg Cd if all sludges were land-applied. However, due to differences in the rate of application of these Cd sources, sludge disposal on land could result in a much higher Cd concentration in the soil. A survey of 5 municipalities where sludge has been applied to soil showed that, in general, little metal accumulation in the soil or crops resulted from sludge application. However, metal concentrations of the sludges from the municipalities were generally low compared to sludge from municipalities with heavy industry. High metal accumulations in the turf in a park and golf course were found in areas where sludge had been applied recently. High metal concentrations were also noted in the soil profile in an area where dewatered sludge had been stockpiled for 2 years. Intensive sampling was conducted at one site where records on the rate of sludge addition for 5 consecutive years were available. Results indicate significant increases above background in DTPA-extractable metals but little leaching of the metals, even though the soil was sandy. Statistical analysis of the sample variability showed that the results were

iite variable and that a large number of replicate eld samples are needed to obtain valid results.

vailable from the National Technical Informa-on Service, Springfield, VA 22161 as PB-259 010, rice codes: A07 in paper copy, A01 in microfiche. irginia Water Resources Research Center, lacksburg, Bulletin 86, (VPI-VWRRC-BULL 5), July 1976. 124 p, 18 fig, 54 tab, 180 ref, ap-end. OWRT B-039-VA(2).

escriptors: *Eutrophication, *Periphyton, Tertiary treatment, *Nutrient removal, Water ollution effects, Algae, Pigments, Biomass, Pri-ary productivity, *Phosphorus, Algal control, Vaste water treatment.
dentifiers: Model stream systems.

. model stream system was established to study ie effects upon periphyton communities of ef-luents from conventional or up-to-date tertiary eatment processes for nutrient(s) removal. Algal hytopigments, dry weight biomass, organic eight biomass, pigment diversity ratios, and pri-ary productivity of these communities were stu-ied during six different experiments. Laboratory cale treatment systems for ferric chloride coagu-tion, flocculation and dual media filtration rocesses were used in the phosphorus removal xperiment and in the carbon and phosphorus ex-eriment. Breakpoint chlorination was used in the trogen removal experiment. A combination of all ie above processes was used in the carbon, itrogen, and phosphorus removal experiment. ymptoms of enrichment and cultural eutrophica-on, as indicated by substantial increases in the ove biological parameters, were noted during ie six experiments. In most cases, the differences these values between control and experimental odel streams were statistically significant. Single utrient removal caused greater increases in these arameters than double or triple removal methods. utrient limitation probably did not occur in any the experiments because of nutrients in the ter-ary effluents. Also, nutrient uptake by the eriphyton of phosphate, nitrate nitrogen, and am-onia nitrogen occurred. Phosphorus fixation and ilization by the periphyton was noted. Based on ese results, phosphorus was probably not defi-ent in the model streams during any of the ex-eriments. Eutrophication problems similar to ose noted in the present study may occur in atural streams and rivers near discharges from rtiary treatment plant facilities. However, pro-ded the receiving aquatic ecosystem is suffi-ently 'healthy' or ecologically diverse, grazing ream herbivores may effectively limit the in-ease in algal biomass.

ITROGEN EXCRETION BY NITROGEN FIX-IG BLUE-GREEN ALGAE: III. UTILIZATION F THE EXCRETED NITROGEN BY GREEN LGAE, (IN GERMAN),
iel Univ. (West Germany). Institut fuer Phar-akognosie.
Pohl, and G. Drath.
Naturforsch Sect C Biosci. 30(2), p 223-226, 75.

Descriptors: *Chlorophyta, Nitrogen fixation, *Cyanophyta, *Algae, Anabaena, Absorption, *Nutrients, *Nitrogen.
Identifiers: Anabaena-cylindrica, Anabaena-solitaria, Chlorella-vulgaris, Chlorhormidium-spp, Scenedesmus-obliquus, Ulothrix-subtilissima, Uronema-barlowi, *Nitrogen fixing alga(Blue-green).

The total combined N (850 micro-mol N/l) excreted by the N fixing blue-green alga, Anabaena cylindrica, during growth in an artificial nutrient medium, was subsequently utilized to a different degree by various green algae (Chlorella vulgaris, Scenedesmus obliquus, Ulothrix subtilissima, Uronema barlowi, Chlorhormidium spp.). Two species of filamentous green algae, Chlorhormidium sp. (strain I) and Chlorhormidium sp. (strain II), proved to be most suitable. When grown in the above N-enriched medium after removal of A. cylindrica, they lowered the N level in the medium from 850 to 460-600 micro-mol N/l within 29 days. When another N fixing blue-green alga, A. solitaria, was grown under unsterile conditions in mixtures of freshwater and seawater with trace elements (Fe, Mn and Mo) added, N levels of 1000-1060 micro-mol N/l were obtained. These levels were subsequently lowered to 530-570 micro-mol N/l by the 2 spp. of Chlorhormidium. Under appropriate growth conditions, the combined N excreted by A. solitaria can possibly be utilized as a N source for green algae.–Copyright 1975, Biological Abstracts, Inc.

BEHAVIOR OF MERCURY IN SUSPENDED SOLIDS AND BOTTOM SEDIMENTS,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
W. P. Bonner, and R. B. Bustamante.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 663, Price codes: A06 in paper copy, A01 in microfiche. Research Report No. 50, July 26, 1976. 118 p, 36 fig, 14 tab, 74 ref. OWRT A-027-TENN(1). 14-31-0001-5043.

Descriptors: *Mercury, Water pollution, Sediments, Heavy metals, *Suspended solids, Pollution control, Toxicity, *Bottom sediments, Aquatic environment, Absorption, Organic matter, Food chains, Path of pollutants.
Identifiers: *Mercury compounds, Mercuric chloride, Mercuric sulfide, Metallic mercury, Phenyl mercuric acetate, Selenium.

Laboratory studies were conducted to show several relationships between selected components of an aquatic environment containing mercury. The data show that mercury as mercuric chloride, mercuric sulfide, phenyl mercuric acetate and metallic mercury becomes associated with sediments very rapidly and with time natural mechanisms in the sediments tend to stabilize or bind the mercury and make it less available to the aquatic environment. Organic components of the water-sediment system play an important role in binding mercuric mercury. Experimental fish show an increase in both the rate of uptake and elimination with increasing temperature between 9 and 30C. Inorganic forms of selenium and mercury are antagonistic toward the toxicity of each other. Collectively, temperature and the presence of naturally occurring organic materials and antagonistic agents could significantly reduce the possibility of mercury accumulation in a food chain leading to man.

EFFECTS OF SEWAGE SLUDGE OR EFFLUENT APPLICATION TO SOIL ON THE MOVEMENT OF NITROGEN, PHOSPHORUS, SOLUBLE SALTS AND TRACE ELEMENTS TO GROUNDWATERS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
A. L. Page, and P. F. Pratt.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 179-187. 1 fig, 38 ref.

Descriptors: *Pollutant identification, *Sewage sludge, *Effluents, *Land use, *Soil water movement, Soil types, Nitrogen, Phosphorus, Salts, Trace elements, Groundwater.

The movement of nitrogen, soluble salts, phosphorus, and trace elements through soils is discussed in terms of the chemistry of these individual constituents and in relation to low and high rate applications of sludges and effluents and soil properties. When considering the movement of these substances through soils, it is important to distinguish between low rates consistent with utilization fro crop production and high rates that might be used for disposal of sludges and effluents or for groundwater recharge using reclaimed waters. At low rates of 3 to 5 tons dry solids per acre per yr to supply the phosphorus needs of crops or 10 to 25 dry tons per acre per yr to supply their nitrogen needs, downward movement of phosphorus and most trace elements is nil or very slow. Soluble salts and nitrate move with drainage waters. At rates of 3 to 5 surface feet of effluent waters per year to supply water needs for irrigated lands, phosphorus and trace elements added will not move downward to any great extent in most soils. Inert sands and gravels of low organic matter contents have low adsorptive capacities and allow rapid transmission of water.Water also generally moves more slowly in soils of higher clay content. Soils other than sands have a high capacity to retain arsenic, cadmium, chromium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc. Where sludge of effluents are added to agricultural soils to supplement plant nutrients or as a source of irrigation water, essentially all of these trace elements applied should remain within the surface meter of soil. In groundwater recharge or disposal involving high application rates, movement of trace elements will depend on the amount and composition of the waters applied and the nature of the soil or sediment. ENVIRONMENTAL EFFECTS OF SLUDGE DISPOSAL IN SANITARY LANDFILLS,
Environmental Protection Agency, Washington, D. C.
B. R. Weddle.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 188-192. 1 fig, 3 tab, 1 ref.

Descriptors: *Pollutant identification, *Environmental effects, *Sludge disposal, *Landfills, *Land use, Sewage sludge, Public health, Soil contamination.
Identifiers: Land application.

The land disposal of sewage sludge involves growing controversy. Advocates of spreading sludge on farmland face increased opposition on the grounds that sufficient information does not exist on the human health implications from long-term low-level injection of crops grown on sludge amended soil. This lack of information about survival and movement of pathogens in groundwater and soils is being used to 'kill' proposed projects for sludge disposal and utilization. The portion of the problem of ultimate sludge disposal dealing with environmental effects of subsurface disposal of municipal waste water sludges is discussed. The

principal conclusions of an investigation of the environmental and economic effects of disposing liquid sludge and septic tank pumpings into a sanitary landfill are included. It was concluded that the solid wastes generated by a city should have adequate capacity to absorb all the water in its liquid digested sludge. A second study was undertaken to evaluate the environmental impact of mixed sludge/solid waste and 'sludge only' disposal sites. Nine sites were selected, including a range of operational practices, geographical, and climatological conditions. Wells were drilled to sample leachate and gas at the sites. The first data was not available in time to be included. (See also W77-00009) (Snyder-FIRL)

POTENTIAL HEALTH IMPACTS OF SLUDGE DISPOSAL ON THE LAND,
Environmental Protection Agency, Research Triangle Park, N.C.
G. J. Love, E. Tompkins, and W. A. Galke.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 204-213. 1 tab, 136 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Public health, *Sludge disposal, Land use, Irrigation effects, Waste water(Pollution), Sludge, Agriculture, Pathogenic bacteria, Viruses, Chemicals.

The potential for adverse human health effects associated with waste water treatment and disposal systems is related to many pathogens and other pollutants with multiple pathways to man. A wide variety of pathogenic bacteria, viruses, and parasites occur in sewage. Effluent and sludges both contain significant numbers of pathogens after primary treatment, but ozonation, pasteurization, gamma radiation, and chlorination can be used to kill pathogens. Pathogens can travel over fairly large distances in aerosols from sewage or sludge spraying, but seldom travel very far in soil. Possible routes of infection include groundwater contamination, aerosols, direct contact with contaminated environments, transmission by wild animals coming into contact with sewage or sludge, and infection of crops. The infectivity of virus appears high, and some routes of infection can involve the production of large numbers of bacterial cells. Little is known about the possible health effects from chronic ingestion of small quantities of organic and inorganic compounds and heavy metals. Obviously a potential for adversely affecting human health is associated with applying waste waters or sludge to agricultural lands. The degree of risk relates to soil types on which the materials are applied, the treatment of the wastes, and care exercised by individuals involved in treatment or land application. The greatest hazard would probably result from disrupting good treatment or sanitary practices. The use of waste waters and sludges to fertilize and irrigate crops in many areas suggests, despite associated disease outbreaks, that the practice can function safely. The limited quantities of essential chemicals and water available to produce food makes it necessary to find a safe use for waste water and sludge. (See also W77-00009) (Snyder-FIRL)

BEFORE REMOVING NUTRIENTS...RE-ANALYZE LAKE TAHOE,
Utah Water Research Lab., Logan.
D. B. Porcella, and P. H. McGauhey.
Water and Wastes Engineering, Vol. 13, No. 2, p 17-19, 23, 44, February, 1976. 1 fig, 2 tab.

Descriptors: *Reclaimed water, *Algae, *Nutrients, *Reservoirs, *Plant growth, Reclamation, Phosphorus, -Nitrogen, Phytoplankton, Phytotoxicity, Organic compounds, Irrigation, *Nutrient removal.
Identifiers: Lake Tahoe, Indian Creek Reservoir.

The use of tertiary effluent as irrigation water for the Indian Creek Reservoir is discussed in relation to the effect of nutrient addition on algal blooms. Observations made at the reservoir after its filling revealed a water quality which is conducive to aquatic weed development but not to phytoplankton blooms. Influent nutrient levels indicated that substantial plant productivity should be observed, and the aquatic weed growth confirmed this to be the case. Factors which may have a role in controlling the presence and quantity of blue green algae in Indian Creek Reservoir include: the presence of excess inorganic nitrogen relative to low phosphorus concentrations, low levels of trace elements which may be limiting to blue greens and other algal groups, the low phosphorus levels in reservoir waters, low concentrations of biostimulatory organic compounds which are probably removed by activated carbon treatment, and the possible toxicity of high nitrogen levels to specific algae. CAUSES AND ALTERNATIVE SOLUTIONS TO THE WATER QUALITY PROBLEMS OF BIG STONE LAKE, WESTERN MINNESOTA-NORTHEASTERN SOUTH DAKOTA,
Midwest Research Inst., Kansas City, Mo.
A. R. Hylton, R. Flippin, A. Aleti, J. R. Ward, and J. Rasmussen.
Journal of Environmental Sciences, p 27-32, May/June, 1976. 5 fig, 1 tab, 11 ref.

Descriptors: *Water pollution effects, *Eutrophication, *Lakes, *Algae, Minnesota, South Dakota, Phosphates, Nitrates, Turbidity, Silts, Nutrients, Fish, Reservoirs, Economics, Dredging, Pollution abatement.
Identifiers: *Big Stone Lake(Minn-SD).

Eutrophication problems associated with Big Stone Lake, a natural lake which lies in the valley of a former glacial river at the western Minnesota-northeastern South Dakota border, are discussed along with some alternatives for eliminating the problem. There are three general types of algae common to the lake: filamentous algae, free floating planktonic algae, and planktonic blue-green algae. The most obvious water quality changes which have occurred in the lake in recent years are an enrichment in phosphates and nitrates and increased siltation and turbidity. The adverse effects of man's influence on the lake's environment may be partially corrected by the following measures: reducing nutrient inflow from feedlots, selective dredging, periodic removal of rough fish, the use of upstream reservoirs, and acceptable land treatment measures. An analysis of the comparative economics of the above control measures is also presented. (Kreager-FIRL)

THE RELATION OF AEROGENIC ANAEROGENIC AEROMONADS OF T 'HYDROPHILA-PUNCTATA-GROUP' IN RIV WATER DEPENDING ON THE POLLUTI LEVEL, (IN GERMAN),
Frankfurt Univ. (West Germany). Hygiene-stitut.
R. H. W. Schubert.
Zentralbl Bakteriol Parasitenkd Infektionskr H Erste Abt Orig Reihe B Hyg Praev Med. 160(3 237-245, 1975.

Descriptors: *Aerobic bacteria, *Anaerobic b teria, *Microorganisms, *Water pollution sourc Rivers, Wastes.
Identifiers: *Aeromonads, Aeromonas-hyd phila, Aeromonas-hydrophila-anaeroger Aeromonas-punctata, Aeromonas-puncta caviae, Saprobic systems, *Aerogenic spec *Anaerogenic species.

Analysis of the relationship between the aeroge and anaerogenic Aeromonas spp. of the hyd phila-punctata group in moving waters with v ing waste loads showed that in the sewage w the anaerogenic subspecies A. hydrop anaerogenes and A. punctata caviae predomi over the aerogenic species A. hydrophila and punctata with an average of 78%. Polysapr rivers and brooks show a similar relation. aerogenic aeromonads (mainly A. hydroph dominate over the anaerogenic aeromonads oligosaprobic brooks with a low range of variat of the individual value of 90% on the average. alpha- and beta-mesosaprobic rivers show (wi great variation of the values indicated at each place) a relation of aerogenic to anaeroge aeromonads of 39:61 for the alpha-mesosaprob and 43:57 for the beta-mesosaprobics on average; they are close to each other in an aver analysis. The great differences in the indivi value of both groups indicate that the determi tion of the relation of the aerogenic to anaeroge aeromonads could show a more sensitive sys of waste contamination or waste load than saprobic system. Since the anaerogenic subspe A. anaerogenes and A. p. caviae are ecologic similar and A. hydrophila of the aerogenic spe is the widely predominating microorganism, de mination of the relation of aerogenic anaerogenic aeromonads of the hydrophila-pu tata group is sufficient.—Copyright 1976, Biol cal Abstracts, Inc.

entifiers: Chironomus-Biappendiculatus, hironomus-Semireductus, *Endochironomus-Alpennis, Macrophytes, Tanytarsus-Gregarius, hite amur, *Biocenoses, *Lake Baltyn(USSR).

ng-term observations were made of the effect the benthic fauna of the overgrowth of Lake ltym (area 753 ha, average depth 3.4 m. maxum depth 6.5 m) located on the eastern slope of e central Urals, 23 km from Sverdlovsk (USSR). uring the past 30 yr the overgrowth of the lake s increased from 15-85%, as a result of which e established biocenoses have undergone conderable reorganization. For example, in 1948 the mplex Chironomus f. 1. semireductur + Tanyrsus gr. gregarius dominated in the benthos, hereas from 1962 the dominating role was played the complex Endochironomus albipennis + hironomus biappenpendiculatus. The pelophilic ocenose of benthic organisms was replaced by a ytophilic one. The foraging conditions of the h deteriorated and their growth and condition clined. Stocking of the white amur and renewal net fishing have reduced the overgrowth of the ke by macrophytes, which in turn has improved e benthic biocenoses.--Copyright 1976, Biologil Abstracts, Inc.

A FOUR-YEAR ANALYSIS OF VEGETATION FOLLOWING AN OIL SPILL IN A FRESHWATER MARSH,
Smith Coll., Northampton, Mass. Dept. of Biological Sciences.
C. J. Burk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 766, Price codes: A03 in paper copy, A01 in microfiche. University of Massachusetts Water Resources Research Center, Amherst, WRRC Pub. No. 71, Completion report FY-76-15, June 1976. 38 p, 6 fig, 13 tab, 17 ref. OWRT A-042-MASS(2). 14-31-0001-5021.

Descriptors: *Freshwater marshes, Salt marshes, *Marsh plants, Water pollution effects, *Oil spills, Plant groupings, *Vegetation, Oil pollution.
Identifiers: Annual plant species, Perennial plant species.

Changes in the composition of vegetation occurring in a freshwater marsh were studied for four years following an accidental oil spillage. Total plant cover and diversity measured by species richness, mean species per quadrat, and the Shannon-Wiener function were progressively reduced in both high and mid-marsh zones for two years after the spillage. Eighteen of the species found before the spill were not found the season following. Perennial species tended to be less affected by the oil immediately following the spill than annual species. The species most markedly reduced included: Cephalanthus occidentalis, Eleocharis acicularis, Leersia oryzoides, Ludwigia palustris, Marsilea quadrifolia, Onoclea sensibilis, Pilea fontana, and Pontederia cordata. Specie essentially unaffected or increasing the season after the oil spill included: Ceratophyllum demersum, Dulichium arundinaceum, Eleocharis palustris, Elodea nuttallii, Lysimachia terrestris, Nuphar variegatum, Polygonum coccineum, Potamogeton epihydrus, and Sagittaria latifolia. The results are discussed in relation to work on the effects of oil spillage on saltmarsh vegetation.

FORT RIVER ECOSYSTEM: PRODUCTIVITY OF THE PERIPHYTON COMPONENT,
Massachusetts Univ., Amherst. Water Resources Research Center.
S. G. Fisher, and W. T. Summer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 772, Price codes: A04 in paper copy, A01 in microfiche. WRRC Pub. No. 72, Completion Report FY-76-16, June 1976. 58 p, 7 fig, 2 tab, 62 ref. OWRT A-068-MASS(1). 14-31-0001-4021.

Descriptors: *Primary productivity, *Periphyton, Streams, Ecology, Ecosystems, *Massachusetts, New England, Light, Water temperature, *Chlorophyll, Monitoring, Respiration, Standing crops, Nutrients, Metabolism.
Identifiers: *Fort River(Mass).

The primary production and general ecology of the periphyton community of a New England lowland stream were studied over a 17-month period. Temperature, discharge, stream bed light, periphyton chlorophyll, and community structure data were monitored regularly. Mean stream bed chlorophyll concentrations ranged from 10 to 136 mg/m2 (annual mean = 44 mg/m2). Seasonally distinct chlorophyll peaks coincided with stream bed light maxima occurring in early May, just prior to leaf out, and again in autumn after leaf fall. However, during midwinter, despite low light levels and high stream discharge, mean chlorophyll concentrations remained higher than summer values. At any given time of the year, stream bed rock-size better accountedfor variations of chlorophyll concentrations between different stream sites than either light or current velocity. Productivity chambers were used to measure productivity and respiration rates of stream periphyton communittee in situ. Periphyton colonized on natural substrates were incubated within these chambers at various temperatures, light intensities and periphyton densities throughout an annual period. Periphyton community respiration was a function of temperature and benthic chlorophyll densities. The summer decline in periphyton standing crop, characteristic of many small streams is discussed. In Fort River, light, discharge, and grazing factors were not sufficient to explain this phenomenon. Although seasonal patterns of stream nutrient concentrations are not associated with seasonal variations in periphyton standing crop, at higher temperatures when increased rates of metabolism and nutrient uptake occur, nutrient limitation becomes more important. This effect is especially important for dense stands of periphyton where much of the population is sheltered from the current, and accounts for both the temperature dependence of the periphyton density to PG/chlor relationship and the low summer periphyton standing crop.

ASSESSMENT OF PRACTICALITY OF REMOTE SENSING TECHNIQUES FOR A STUDY OF THE EFFECTS OF STRIP MINING IN ALABAMA,
Alabama Univ., University. Dept. of Geology and Geography.
T. H. Hughes, A. C. Dillion, III, J. R. White, Jr., S. E. Drummond, Jr., and W. G. Hooks.
Available from the National Technical Information Service, Springfield, Va 22161 as N76-15534, Price codes: A09 in paper copy, A01 in microfiche. Final Report, July 1, 1973-June 30, 1975. 190 p, 41 fig, 25 tab, 56 ref, 4 append. NASA 1-3-80-0084(1F), NASA NAS8-29936.

Descriptors: *Remote sensing, *Strip mines, *Erosion, *Sedimentation, *Mine drainage, Alabama, Acid mine water, Vegetation, Equations, Rill erosion, Gully erosion, Sheet erosion, Mining, Aerial photography, On-site investigations, Geochemistry, Chemical analysis, *Pollutant identification.
Identifiers: Mining reclamation, Strip mining effects.

The areal extent of strip mining was measured from aerial photographs for two mining areas. Reclamation by grading and revegetation was also observed on these photographs. Twenty slopes were selected within the Searles Area for measurement of the amount of material removed by rill and gully erosion. Three stages in the evolution of rill and gully channel profiles were recognized: Stage 1, the rill stage lasts three to six years after mining. Stage 2, the intermediate stage, lasts six to eight years. Stage 3, the gully stage begins twelve to fifteen years after mining. The volume of sediment in Bluff Creek was obtained by three methods: (1)Direct measurement, in the field, of the width and depth of sediment in the stream valley, construction of cross-sections and projections of average cross-sectional areas through the distance separating adjacent cross-sections; (2)Measurement and projection of the areas contained in stream terrace deposits; (3)From the measured cross-sections, an empirical equation was derived that relates the cross-sectional area to the width of the stream valley. A model for the production of acid mine water was developed. Samples of mine drainage from 22 stations were collected and analyzed. (Sims-ISWS)

SURFACE NUTRIENTS, CHLOROPHYLL-A AND PHAEOPIGMENT IN SOME SCOTTISH SEA LOCHS,
Dunstaffnage Marine Research Lab., Oban (Scotland).

L. Solorzano, and B. Grantham.
Journal of Experimental Marine Biology and Ecology, Vol. 20, No. 1, p. 63-76, 1975. 8 fig., 20 ref.

Descriptors: *Nutrients, *Chlorophyll, *Pigments, *Saline water-freshwater interfaces, Phytoplankton, Spring, Nitrates, Phosphates, Silicates, Freshwater, Productivity, Limiting factors, Inflow, Turbulence, Estuaries, Water circulation, Salinity, Europe, Runoff, Euphotic zone, Eutrophication.
Identifiers: *Phaeopigments, Loch Creran(Scotland), Loch Etive(Scotland), Loch Linnhe(Scotland).

The influence of freshwater runoff on concentration and distribution of nutrients, chlorophyll, and phaeopigments during spring phytoplankton blooms in Lochs Creran, Etive, and Linnhe, Scotland, was studied. Nitrate, phosphate, and silicate concentrations were related to fluctuations in freshwater input and uptake by phytoplankton populations. Nitrate to phosphate and silicate ratios in Lochs Creran and Linnhe were similar, but values for Loch Etive were markedly different. Nitrate, not phosphate, was a critical factor in productivity of Lochs Creran and Linnhe. Limitation of these nutrients in Loch Etive was directly affected by the amount of freshwater entering the loch. Patchiness in chlorophyll and phaeopigments in Lochs Creran and Etive reflected factors, such as freshwater/seawater inflow, turbulance produced by loch topography, etc., which affect loch surface circulation. Delay in development of phytoplankton blooms in Loch Linnhe may be due to poor surface layer stability due to low runoff. Freshwater input is the most important factor determining initiation and support of phytoplankton populations; it adds nutrients, trace metals, and growth promoting factors; increases water column stability; and keeps cells in the euphotic zone. When freshwater runoff is relatively high, it increases phytoplankton dispersion in the zone of better illumination outside lochs, thus expanding production. (Buchanan-Davidson-Wisconsin)

THE INFLUENCE OF HYDROLOGICAL CONDITIONS ON DISSOLVED AND SUSPENDED CONSTITUENTS IN THE MISSOURI RIVER,
Wisconsin Univ., Madison. Lab. of Hygiene.
J. J. Delfino, and D. J. Byrnes.
Water, Air, and Soil Pollution, Vol. 5, No. 2, p. 157-168, 1975. 1 fig., 2 tab., 28 ref.

Descriptors: *River flow, *Dissolved solids, *Suspended solids, *Missouri River, *Runoff, *Nebraska, Water quality, Chemical properties, Silica, Conductivity, Sodium, Calcium, Ions, Alkalinity, Chlorides, Sulfates, Turbidity, Nitrogen compounds, Phosphorus, Oxygen demand, Agricultural watersheds, Carbon, Potassium, Iron, Manganese, Zinc, Copper, Cations.

The variability in flow characteristics of a stretch of the Missouri River near Brownville, Nebraska, were studied over a three year period from 1970-1972. River discharges ranged from 10,000 cfs. The river's chemical composition was strongly influenced by discharge conditions through dilution of normal concentrations by runoff from rain and snowmelt or enhancement through suspended solids carried from land and scoured from the river bottom. Generally increased river discharge caused by runoff decreased the concentration of major dissolved ionic constituents in the river—total dissolved solids, ammonia, soluble orthophosphate, sodium calcium, bicarbonate alkalinity, chloride, and sulfate. Turbidity, total suspended solids, total organic nitrogen, total phosphorus, chemical and biochemical oxygen demand, total organic carbon, potassium, iron, manganese, zinc, and copper concentrations became elevated with higher discharges; these values could be strongly correlated with total suspended solids in 1972. Since the major land use is agricultural, the investigation results should be considered when attempts are made to control nonpoint pollution sources. Data must be used cautiously when applying the results of a single sampling analysis in geochemical transport calculations due to the extreme variability in concentrations. (Buchanan-Davidson-Wisconsin).

ALGAL PRODUCTIVITY IN 49 LAKE WATERS AS DETERMINED BY ALGAL ASSAYS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
W. E. Miller, T. E. Maloney, and J. C. Greene.
Water Research, Vol. 8, p. 667-679, 1974. 11 fig., 7 tab., 12 ref.

Descriptors: *Eutrophication, Analytical techniques, *Lakes, *Bioassay, *Trophic level, Limiting factors, Calcium, Magnesium, Alkalinity, Carbon, Phosphorus, Nitrogen, Iron, Essential nutrients, Hardness(Water), *Pollutant identification, Water pollution effects, *Productivity.
Identifiers: Selenastrum capricornutum, *Algal assays, *Algal productivity.

Algal assays were done on samples from 49 American Lakes to determine the limiting factor in algal productivity. There was high correlation between the trophic state of 23 lakes and the algal assay productivity response. No correlation was noted between calcium, magnesium, alkalinity, and carbon increases and the maximum yield of Selenastrum capricornutum in the samples. Phosphorus was limiting in 35 lakes, nitrogen in 8 lakes, and other nutrients in 6 lakes. Generally phosphorus limitation decreased as the lake's trophic state increased: 83% of low, 75% of moderate, 64% of moderately high, and 50% of high productivity lake waters were phosphorus-limited for algal growth. Lake waters with high orthophosphate concentrations are more likely to become algal growth-limited by nitrogen or another nutrient. In the presence of other essential nutrients, addition of 1.00 mg nitrogen and 0.05 mg phosphorus/liter should support 20-30 mg algal dry weight/liter. Only 5 of 11 autoclaved-filtered low productivity waters supported this much algal growth with nitrogen and phosphorus supplements, indicating that other nutrients were limiting or a toxicity factor was present. Manganese in autoclaved-filtered Lake Herman water inhibited algal growth. It is not known if manganese was directly toxic to the test algae or if it restricted the availability of essential nutrients. (Buchanan-Davidson—Wisconsin)

EFFECTS OF OIL ON THE REPRODUCTION OF THE AMPHIPOD GAMMARUS OCEANICUS,
Swedish Water and Air Pollution Research Lab., Nykoping. Baltic Sea Lab.
O. Linden.
Ambio, Vol. 5, No. 1, p. 36-37, 1976. 1 tab., 1 fig., 7 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Reproduction, *Amphipoda, Marine animals, Toxicity, Incubation, Larvae, Broods, Animal behavior, Fecundity.
Identifiers: *Gammarus oceanicus, Sub-lethal effects, Crude oil.

Long-term effects of sub-lethal amounts of crude oil on the reproduction of Gammarus oceanicus are described. When couples in the precopula stage were exposed to low oil levels in water length of incubation was unaffected, but fewer larvae were produced by females exposed to oil. The percentage reduction in brood number was about 50% with smaller females and 20% with long females; in absolute numbers the reduction was similar for all sizes of females. Couples in the precopula stage were separated, then brought together in water containing 1, 10, 20, or 4 microliters of oil per liter of water. In unpolluted sea water and the lowest oil concentration, the male grasped the female shortly after introduction by 24 hours all the couples had reentered into the precopulation stage. With higher oil concentrations, no couples were observed in the precopulation stage, except at the end of the experiment in samples containing 10 microliters oil/liter. The frequency with which the male and the female enter the precopulation stage, which is necessary for successful fertilization, decreased in the presence of low oil concentrations. Reduced fecundity due to sub-lethal concentrations of oil pollutants has serious ecological consequences. (Buchanan-Davidson—Wisconsin)

Identifiers: Scenedesmus acutus, *Algal metabolites

The sesquiterpene alcohol farnesol, aromatic b phenyl-ethyl alcohol, and ketole 4-hydroxy

methyl-pentanone (diacetone alcohol) were identified in extracts from the green alga Scenedesmus acutus, strain Tomaselli 8. Biological effects of these metabolites on Scenedesmus growth for 90 days were determined. Increase in dry matter was the most marked biological effect. Farnesol caused the largest increase followed by diacetone alcohol and phenyl-ethyl alcohol. Cell counts also increased. Cell lengths increased with phenyl-ethyl alcohol and diacetone alcohol. All treated cells were rounded off. Therefore increased dry weights were due to increased cell dimensions, rather than cell numbers. In all treated cultures, cell dimensions and numbers were about the same on the fifteenth and nineteenth days, but dry matter decreased. All substances inhibited bacterial flora. Color changes suggested changes in the algal physiological state. More colonies developed with inoculations of treated cultures, indicating that the treated cells were in better condition; more colonies were obtained with phenyl-ethyl alcohol and fewer with farnesol. Their effects on growth were the same for the entire cultivation period. It is assumed that these materials accelerate ontogenetic development or increase autospore numbers. THE EXTRA 02 EVOLVED DURING NITRATE UTILIZATION BY CHLORELLA,
Centre d'Etudes Nucleaires de Cadarache, Saint Paul-lez-Durance (France). Department de Biologie.
R. Gerster, G. H. Lorimer, and B. Vennesland.
Plant Science Letters, Vol. 5, No. 4, p. 255-260, 1975. 1 fig., 1 tab., 8 ref.

Descriptors: *Oxygen, *Nitrification, *Chlorella, *Chlorophyta, Oxygen isotopes, Ammonia, Carbon dioxide, *Algae, Mass spectrometry, *Pollutant identification.
Identifiers: *Oxygen evolution.

Nitrate reduction by green algae and higher plants occurs in two steps, catalyzed by nitrate reductase and nitrite reductase. When nitrite reductase catalyzes reduction of nitrite to ammonia, six electrons are required. Four of the six electrons involved might come from the oxygen atoms of nitrite; the oxygen atoms from nitrite might contribute to oxygen evolved by chloroplasts. Because of nitrite oxygen instability, the green alga, Chlorella vulgaris, was fed nitrate-018. Nitrate addition to illuminated cells caused increased oxygen evolution in the presence and absence of added carbon dioxide. Nitrate oxygen did not contribute any significant label to oxygen evolved when nitrate was reduced. The rate of oxygen evolution measured in the presence of carbon dioxide and nitrate was larger than the sum of the rate measured with nitrate alone plus the rate measured with carbon dioxide alone. Either carbon dioxide utilization was stimulated by nitrate or nitrate utilization was stimulated by carbon dioxide, even in cells already rich in carbohydrate. Net carbon dioxide utilization decreased and/or carbon dioxide production increased during nitrate utilization. The net amount of extra oxygen evolved during nitrate reduction in the presence of carbon dioxide was 2.6 micromoles of oxygen. (Buchanan-Davidson--Wisconsin)

SUBSTITUTE CHEMICAL PROGRAM: INITIAL SCIENTIFIC AND MINIECONOMIC REVIEW OF MALATHION.
Midwest Research Inst., Kansas City, Mo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 818, Price codes: A12 in paper copy, A01 in microfiche. Report EPA-540/1-75-005, March 1975. 260 p. 5 fig., 41 tab., 363 ref.

Descriptors: *Environmental effects, *Pesticides, *Pesticide kinetics, *Evaluation, Pesticide toxicity, Crop response, DDT, Safety, Economic efficiency, Hydrolysis, Hazards, Oxidation, Formulation, Degradation(Decomposition), Pesticide residues, Regulation, Pathology, Lethal limit.
Identifiers: *Malathion, Pharmacology, Toxicology, Tolerance levels.

An initial scientific and microeconomic review, conducted to determine if there is sufficient data to make a judgment with respect to the safety and efficacy of Malathion as a registered substitute for DDT, is detailed. Its production and chemical formulation, use, pharmacology, toxicology, food tolerances, acceptable intakes, its fate and significance in the environment, use hazards, and an assessment of the efficacy and cost effectiveness are presented. Its environmental effects are evaluated in connection with its effect on aquatic life, wildlife, beneficial insects, residues in soil, water, and air, and nontarget plants; also discussed is its bioaccumulation, biomagnification, degradation, and environmental transport mechanisms. The federal and state regulations concerning its use; and its use patterns in agriculture (by major crops and regions), industry, governmental agencies, home and garden uses are presented. The basic producer of Malathion is the American Cyanamid Company and its estimated production volume in 1972 was 24 million pounds of active ingredients. Import volume was 153,769 pounds in 1972; the 1972 export volume is estimated to have been 8 million pounds of active ingredient. Figures are incomplete, thus care should be taken in interpreting results. This report represents a summary of scientific data obtained from various sources. (Auen-Wisconsin).

THE BENTHIC ECOLOGY OF LOCH LINNHE AND LOCH EIL, A SEA-LOCH SYSTEM ON THE WEST COAST OF SCOTLAND. IV. CHANGES IN THE BENTHIC FAUNA ATTRIBUTABLE TO ORGANIC ENRICHMENT,
Dunstaffnage Marine Research Lab., Oban (Scotland).
T. H. Pearson.
Journal of Experimental Marine Biology and Ecology, Vol. 20, No. 1, p. 1-41, 1975. 12 fig., 8 tab., 25 ref.

Descriptors: *Benthic fauna, *Succession, *Water pollution effects, *Organic matter, Pulp wastes, Anaerobic conditions, Biochemical oxygen demand, Biological communities, Biomass, Suspended solids, Varieties, Dominant organisms, Europe, Estuaries, Eutrophication.
Identifiers: *Loch Linnhe(Scotland), *Loch Eil(Scotland).

Effects of pulp and paper mill effluents on benthic fauna of Lochs Linnhe and Eil due to organic enrichment of sediments, were studied. The effluent affected the system because of short-term biochemical oxygen demands caused by dissolved organic material in the effluent and long-term biochemical oxygen demands due to suspended solids, primarily macerated wood fiber. As organic enrichment increased, certain species were progressively eliminated and surviving species increased in numbers. Later species not usually in the original fauna immigrated and appeared specifically associated with sediments having very high organic contents. In the last succession stage even the specialized 'high organic' fauna was eliminated. Excessive organic deposition caused anoxic conditions at the sediment-water interface which resulted in elimination of all but a few annelid species. Minor variations in sediment type or salinity may initially cause benthic population changes at low levels of organic detrital input but they are overshadowed when organic matter input is increased the described successional changes are discussed in the light of recent hypotheses concerning ecological change in relation to environmental stress. A REINVESTIGATION OF SOUTHERN CALIFORNIA ROCKY INTERTIDAL BEACHES THREE AND ONE-HALF YEARS AFTER THE 1969 SANTA BARBARA OIL SPILL: A PRELIMINARY REPORT,
University of Southern California, Los Angeles. Allan Hancock Foundation.
R. Cimberg, S. Mann, and D. Straughan.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 697-702, 2 fig, 1 tab, 17 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Environmental effects, *Aquatic animals, *Aquatic plants, California, Beaches, Intertidal areas, Sediments, Mortality.
Identifiers: *Outer Continental Shelf, Biological effects, *Santa Barbara(CA), Substrates, Tide pools, Balanus, Chthamalus, Enteromorphia, Chaetomorpha, Ulva, Ralfsia, Porphyra, Endocladia, Hildenbrandia, Rhodoglossum.

Ten rocky intertidal beaches in southern California, which were surveyed for a 12-month period following the 1969 Santa Barbara oil spill, were reinvestigated in June and July of 1972. Data from this 1972 survey as well as data collected during the same months on the same beaches in 1969 and 1970 were analyzed by forming beach groupings using cluster analysis. This analysis indicates that sand movement and substrate stability are the two most important factors affecting the presence of marine organisms on these beaches during this period. Overall, the effect of the 1969 Santa Barbara oil spill on the presence and abundance of rocky intertidal organisms was less important than other environmental factors. Most mortalities reported were localized in tide pools and high intertidal areas. (See also W76-09312) (Sinha-OEIS)

THE RESPONSE OF MACROINVERTEBRATES TO GASOLINE POLLUTION IN A MOUNTAIN STREAM,
Environmental Protection Agency, Kansas City, Mo. Surveillance and Analysis Div.
S. L. Bugbee, and C. M. Walter.

In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 725-731, 1 fig, 3 tab, 4 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Gasoline, *Streams, *Toxicity, *South Dakota, Aquatic animals, Aquatic plants, Mountains, Sediments.
Identifiers: Biological effects, Aviation gasoline.

On November 23, 1969, a gasoline transport truck overturned on the U.S. Highway 16 bridge crossing Grace Coolidge Creek east of Custer in South Dakota, discharging an estimated 5,000 gallons of aviation gasoline to the stream. Immediately following the spill, the gasoline was flushed downstream with large volumes of water to reduce the fire hazard in the park area. The sudden increase in flow thoroughly mixed the gasoline in the stream incorporating some fractions into the sediments. The majority of aquatic invertebrates and about 2,500 fish (30% trout species) were killed for at least two miles downstream from the spill. Gasoline residues in the sediments on the rocks prohibited the recolonization of mayflies, stoneflies and certain caddisflies for at lease six months following contamination. The midge Orthocladius was the most resistant organism. The reappearance of mayfly and stonefly nymphs in the contaminated reach of the stream 12 months after the spill indicated a significant degree of recovery in the macroinvertebrate community. The persistence of gasoline in the stream bed six months after the spill as well as the restricted rate of recolonization of macroinvertebrates demonstrates complicated, long-term problems resulting from the interaction of petroleum products with the environment. TERRESTRIAL OIL SPILLS IN ALASKA: ENVIRONMENTAL EFFECTS AND RECOVERY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
P. G. Hunt, W. E. Rickard, F. J. Deneke, F. R. Koutz, and R. P. Murrman.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 733-740, 12 fig, 16 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Environmental effects, *Ecosystems, *Permafrost, *Microbial degradation, *Alaska, Vegetation, Pipelines.
Identifiers: *Biological effects, Petroleum, Nitrobacter, Nitrosomonas, Crude oils.

Damage and natural recovery of terrestrial ecosystems affected by refined petroleum spills along the Haines to Fairbanks military pipeline in Alaska were investigated. Mosses and trees were completely killed, and vegetation is now sparse in the drier portions of the spill areas. Some new vegetation is growing in drainage pathways. The dead organic mat has provided adequate insulation, and only a few instances of slope instability where slopes exceed 20%, occurred. Through laboratory studies on the rates of microbial respiration in Fairbanks silt containing 15% Prudhoe crude, it was determined that microbial activity is increased by inoculation with mixed-culture oil-degrading microorganisms, increased pH, and phosphorus additions. Microbial activity also responds positively to nitrogen addition after an initial negative response. (See also W76-09312) (Sinha-OEIS)
W77-00269

A STUDY OF THE EFFECTS OF THE SAN FRANCISCO OIL SPILL ON MARINE ORGANISMS,
College of Marin, Kentfield, Calif.
G. L. Chan.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 741-781, 26 fig, 13 ref, 15 append.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Environmental effects, *California, Aquatic animals, Reefs, Aquatic plants, Mussels, Intertidal areas, Beaches, Shores, Coasts, Bays.
Identifiers: *Outer Continental Shelf, Biological effects, Collisions, Littorina spp. Acmaeca spp. Mytilus, Balanus, Urospora, Endocladia, Gigartina, Phyllospadix, Tegula, San Francisco Bay(Calif).

The San Francisco oil spill occurred on January 18, 1971, during the early morning hours when two Standard Oil vessels collided almost directly under the Golden Gate Bridge, releasing 840,000 gallons of Bunker C fuel. This asphalt-like oil was washed up on intertidal shores of the area. The oil was heavily deposited on the Duxbury Reef's mussel beds and high tidal berm rocks. It was determined that marine organisms died from being smothered by the oil, with certain species, such as acorn barnacles and limpets, suffering the highest mortality at Sausalito and on Duxbury Reef. Comparison of pre-oil and post-oil transect counts showed there was a significant decrease in marine life after the oil spill on the reef. Marine snails suffered less mortality than the sessile barnacles and other sedentary animals. The normally large population of striped shore crabs is missing from the rocky crevices. Finally, marine algal blooms were also observed in certain reef localities. The present conditions of Duxbury Reef (December, 1971) is one of apparent good health; the recruitment of some marine animals appear to be approaching normal levels. The oil has disappeared from much of the reef surfaces and is barely discernible in the most heavily deluged areas. (See also W76-09312) (Sinha-OEIS)

INTERAGENCY INVESTIGATIONS OF A PERSISTENT OIL SPILL ON THE WASHINGTON COAST,
National Marine Fisheries Service, Seattle, Wash.
R. C. Clark, Jr, J. S. Finley, B. G. Patten, D. F. Stefani, and E. E. DeNike.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 793-808, 12 fig, 5 tab, 18 ref.

Descriptors: *Oil pollution, *Oil spills, *Water pollution effects, Aquatic animals, Aquatic plants, *Environmental effects, *Washington, Coasts, Beaches, Intertidal areas, Crabs, Algae.
Identifiers: *Outer Continental Shelf, Biological effects, Urchins, Barnacles, Paraffin hydrocarbons, Petroleum hydrocarbons, Fuel oil, Mitella polymerus, Strongylocentrotus purpuratus, Hemigrapsus nudus, Fucus gardneri.

An interagency team of biologists, chemists, oceanographers and engineers investigated the long-term effects of oil spilled by the grounding of the troopship GENERAL M.C. MEIGS January 6, 1972, on an ocean coast intertidal community of plants and animals. Oil was released from the 440,000 liters of Navy Special Fuel Oil carried by the vessel. A series of sites, forming a vertical profile of the rocky shelf area from the upper intertidal zone to the lowest low tide level in Wreck Cove was studied. This report describes the preliminary findings of the first ten months (January-October, 1972) of the investigation. Abnormal and dead urchins indicated that this species was affected. Loss of fronds and bleached thalli not evident in control areas were observed in the plant community in the immediate vicinity of the hulk. Petroleum hydrocarbons were taken up in the intertidal community. The normal paraffin hydrocarbon patterns and content over the range n-C14H30 to n-C37H76 of healthy-appearing goose barnacles, crabs, and an alga display the same basic characteristics as the fuel oil which had been lost. CHROMOSOME MUTAGENESIS IN DEVELOPING MACKEREL EGGS SAMPLED FROM THE NEW YORK BIGHT,
National Oceanic and Atmospheric Administration, Boulder, Colo. Marine Ecosystems Analysis Program Office.
A. C. Longwell.
NOAA Technical Memorandum ERL MESA-7, April 1976. 64 p, 4 tab, 16 plates, 106 ref.

Descriptors: *Fish eggs, *Water pollution effects, Heavy metals, Fishes, Cadmium, Pesticides, Metals, Radiation, *Embryonic growth stage, Sampling.
Identifiers: *Chromosome abnormalities, *Mutagenesis, *Genetic damage, *Mutagens, *New York Bight, *Mackerel eggs, Scomber scombrus, Cyto-genetics, Chromosome mutagenesis, Atlantic mackerel.

Altogether 30,689 embryo cells were scored in 45 eggs from the 14 different stations in the New York Bight collected from surface waters during the May 7-18, 1974 cruise of the Westward. Less than 20% of the eggs had all their dividing cells free from chromosome and division abnormalities. One-third of the 30,689 division figures scored for all the embryos were abnormal. All but an insignificant number of eggs sampled were those of Scomber scombrus, the Atlantic mackeral. Abnormalities of the chromosomes extended through the entire range of radiomimetic effects on the chromosomes and their division apparatus, including extreme stickiness of chromosomes having obvious division difficulties and irregularities, failure of chromosomes to orient on spindles, with consequent loss of chromosomes, and chromosome breakage. Not all chromosome or division irregularities are microscopically detectable even with the most refined methods. Only a portion of observable abnormalities would be expected to be recorded with the cyto-genetic scoring system used in this study. The collection of the Westward data on largely the early embryo stage means that the earlier stage zygotes, so chromosomally abnormal that they could not gastrulate, are not represented. Differences between best and worst stations are so minimized. (NOAA)

EFFECTS ON COMMERCIAL FISHING OF PETROLEUM DEVELOPMENT OFF THE NORTHEASTERN UNITED STATES,
Woods Hole Oceanographic Institution, Mass. Marine Policy and Ocean Management Program.
D. W. Allen, R. B. Allen, R. E. Black, J. M. Friedman, and L. G. Mallon.
Report No. WHOI-76-66, April 1976. 80 p, 40 fig, 11 tab, 96 ref. SG-04-6-158-44016.

Descriptors: *Northeast US, *Commercial fishing, *Oil pollution, *Oil spills, *Water pollution effects, *Fisheries, *Environmental effects, *Continental Shelf, *Resources development, Oil industry, International law, Damages, Compensation, Jurisdiction.
Identifiers: *Outer Continental Shelf, Northeast US Coast, Baltimore Canyon, Georges Bank, New England States, Offshore technology, Environmental impact.

A study of the possible effects of future offshore petroleum development on the commercial fishing industry of the New England and Mid-Atlantic states is reported. The study was based on a variety of sources: two workshops involving fishermen, government officials and oil industry representatives; visits to the Gulf of Mexico and the North Sea; interviews with state coastal zone planning officials and with federal officials responsible for offshore development; interviews

vith and questionnaires from fishermen; and inally, the analysis of existing fisheries data and he review of previous studies. The report con-iders the effects on fisheries in three general ategories: offshore interactions, onshore interac-ions, and pollution effects. Estimates are made of he probable magnitude of these effects on com-nercial fishermen and recommendations are made o minimize undesired consequences. The report lso contains general descriptions of the physical nvironment on the continental shelf of the area; he commercial fishing industry; the technology of he petroleum industry; and the legal and regulato-y framework governing the industries on the con-inental shelf. A RAPID METHOD FOR MEASURING THE ACUTE TOXICITY OF PULP MILL EFFLUENTS AND OTHER TOXICANTS TO SALMONID FISH AT AMBIENT ROOM TEMPERATURE,
B. C. Research Ltd., Vancouver.
D. J. McLeay.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 6, p 1303-1311, June, 1976. 6 tab, 24 ref.

Descriptors: *Pulp wastes, *Toxicity, *Salmonids, *Bioassay, Analytical techniques, Wastes, Industrial wastes, Water pollution sources, Water pollution effects, Lethal limit, Rainbow trout, Fish, Dissolved oxygen, Water pollution, Zinc, Phenols, Toxins, Pollutants, Chlorinated hydrocarbon pesticides.
Identifiers: Coho salmon(Oncorhynchus kisutch), Dehydroabietic acid, Lindane(Gamma-benzene hexachloride), Chlorine compounds, Resin acids.

A residual oxygen bioassay performed at ambient room temperature is examined as a rapid method for measuring the acute toxicity of pulp mill effluents and other toxicants to salmonid fish. Tests results are evaluated in comparison with 96-hr LC(50) bioassays. At test temperatures of 19-22 C and coho salmon (Oncorhynchus kisutch) loadings of 4-5 g/liter, residual oxygen levels were elevated in effluent concentrations equivalent to 0.5-0.9 of the samples' 96-hr LC(50) values; these tests were completed within 5-6.5 hr. Sensitivity increased only slightly with a loading of 1 g/liter and this test required 18 hr for completion. Decreasing the number of fish per jar from 4 to 1 while holding fish loadings constant by varying the size of the test containers did not alter the tests' sensitivity. Results indicate that, with a loading of 4-5 g fish/liter and 10 replicates of 1 fish/jar, a residual oxygen bioassay at ambient room temperature is more sensitive than a 96-hr LC(50) batch replacement bioassay (2 liters/g fish/day). Under these conditions fish requirements are identical; the residual oxygen test is completed within 6.5 hr and 32- to 40-fold reduction in volume of test solutions required is achieved. The procedure was evaluated with rainbow trout (Salmo gairdneri) using dehydroabietic acid, zinc, phenol, and lindane. Significant responses occurred with these toxicants at concentrations equivalent to 0.5-1.0 of the samples' 96-hr LC(50) values and higher. (Witt-IPC)

Journal Water Pollution Control Federation, Vol. 48, No. 7, p 1766-1771, July, 1976. 1 fig, 3 tab, 17 ref.

Descriptors: Enteric bacteria, Aquatic bacteria, *Coliforms, *Pulp wastes, *Salmonella, *Alabama, *Water pollution sources, Wastes, Industrial wastes, Water pollution, E. coli, Bacteria, Aerobic bacteria, Water temperature, Hydrogen ion concentration, Public health, Microorganisms, Aquatic microorganisms, Effluents, *Path of pollutants, Bays.
Identifiers: *Enterobacter, *Klebsiella, *Mobile Bay(Ala), Garrows Bend(Ala).

The distribution of coliform biotypes and Salmonella species in waters below a pulp mill on Garrows Bend off the northwest tip of Mobile Bay, Alabama, was determined. The bacterial isolates were obtained from gauze traps and surface water grap samples. Water temperature and pH were monitored. Of the organisms isolated, 60% were identified as Klebsiella and 34% as Escherichia coli. The remaining 6% were primarily members of the genus Enterobacter. Only one Salmonella isolate was obtained, a group C Salmonella. The findings are discussed in terms of potential health effects and the interpretation of total and fecal coliform data from such waters. (Witt-IPC)

ON THE EUTROPHICATION IN THE LAKE CHANGJA, (IN KOREAN),
Seoul National Univ. (Republic of Korea). Dept. of Botany.
K. Lee, K. B. Uhm, and Y. M. Kwon.
Korean J Bot 18(3), p 135-138, 1975.

Descriptors: *Eutrophication, Lakes, Asia, Bacteria, Water pollution effects, Water temperature, Stratification, Dissolved oxygen, Phosphorus, Nitrogen, Chlorophyll, Coliforms.
Identifiers: *Lake Changja(Korea).

The process of eutrophication was studied in Lake Changja, Korea, from Nov. 1974-May 1975. Water temperature stratification occurred in April; the dissolved O2 content varied slightly; it was almost 0 beginning in Jan. Total P increased very rapidly in Feb.; total N and carbohydrate-like substances increased slightly. The amount of chlorophyll-alpha varied from 127-717 mg/m2 with maximum value in Jan.; chlorophyll-alpha and total P related to each other. The numbers of coliform bacteria at point A were 10 times greater than at point B. Lake Changja is very eutrophic; its ecological equilibrium cannot be recovered until the origin of pollution is eliminated.—Copyright 1976, Biological Abstracts, Inc.

THE EFFECT OF SURFACE-ACTIVE SUBSTANCES ON PATHOGENIC ENTEROBACTERIA IN WATER, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (II) (USSR).
V. V. Shelakova.
Gig Sanit 3, p 25-28, 1975.

Descriptors: *Pathogenic bacteria, Bacteria, *Ions, *Salmonella, Inhibition, Cations, Anions, Water pollution effects.
Identifiers: *Salmonella-typhimurium, *Surface-active substances, LD50.

The anion-active and nonionogenic surface-active substances (SAS) at concentrations of 10-20 mg/l can stimulate Salmonella multiplication. The cation-active SAS when present at high concentrations inhibit Salmonella multiplication. In case of simultaneous entry into the body of SAS and the infectious agent (S. typhimurium) the value of its LD50 diminished and its virulence increased. Contamination of water bodies with SAS may deteriorate their sanitary-epidemic situation.—Copyright 1976, Biological Abstracts, Inc.

GEOGRAPHICAL AND SEASONAL VARIABILITY OF MARINE PLANKTON.
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
Available from the National Technical Information Service, Springfield, VA 22161 as TT-74-50030, Price codes: A14 in paper copy, A01 in microfiche. TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,' Leningradskoe Otdelente, Leningrad, 1972. B. E. Bykhovskii, editor. 309 p.

Descriptors: *Ecological distribution, *Marine microorganisms, *Oceans, *Zooplankton, Systematics, Speciation, Phylogeny, Evolution, Copepods, Latitudinal studies, Ecotypes.
Identifiers: Morphogenesis, Calanidae, Oithonidae.

Because of vast protein resources in the world oceans investigations conducted by the Laboratory of Marine Research attached to the Zoological Institute of the USSR Academy of Sciences are presented. They relate to planktonic ecology, systematics, speciation, morphogenesis, phylogeny, and microevolution. Results of variation statistics and comparative functional-morphological studies of copepod populations collected by Soviet expeditions to different oceans are presented. A new classification for the family Calanidae based on phylogenetic relationships and closely related to oceanic zoogeographic zones was developed. The polymorphic species Calanus plumchrus in the North Pacific has three independent forms with their own geographical range. Some species of the family Oithonidae display a complex geographical variability. Morphological details of the genus Calanus mouth apparatus are described; changes occurred depending on diatom or dinoflagellate predominance in crustacean food, which is a function of latitudinal zonation. Studies of seasonal shifts, distribution, and ecology of planktonic complexes in little explored parts of the ocean and Antarctica coastal waters are reported. The articles cover a cross-section of the main trends in plankton research being done at the Academy's Department for Plankton and Lower Crustacea to clarify the qualitative composition of oceanic plankton. PHYLOGENY OF THE FAMILY CALANIDAE(COPEPODA) ON THE BASIS OF A COMPARATIVE MORPHOLOGICAL ANALYSIS OF ITS CHARACTERS,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
K. A. Brodskii.
In: Geographic and Seasonal Variability of Marine Plankton, TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,'Leningradskoe Otdelente, Leningrad, 1972. B. E. Bykhovskii, editor, p. 1-127. 123 fit., 21 tab., 34 ref. 27 ref.

Descriptors: *Marine microorganisms, *Phylogeny, *Copepods, *Systematics, Speciation, Ecological distribution, Environmental effects, Latitudinal studies, Spatial distribution, Oceans, Fish food organisms, Zooplankton.
Identifiers: *Calanus, Calanus macrocarinatus, Undinula, Calanoides, Neocalanus, Nannocalanus, Canthocalanus.

The systematics of the family Calanidae (Copepoda) of all known species in the world oceans are examined and classified according to the following characters: Female genitalia, fifth pair of male or female limbs, body length, antennule length, cephalothorax form, last thoracic segment form, structure of first pair of female limbs, and special formations (morphological peculiarities of the swimming feet of different species). Parameters of the species Undinula related to length of the body and the antennules, number of setae, etc., were not considered. Species of genus Calanus were considered valid and the subgenera analyzed. Certain morphological features such as length and form of the body and armature of first and fifth pairs of limbs depend on ecological conditions related to latitudinal zones. A phylogenetic scheme is established for the family according to chronological and spatial principles. Relationships were found between variations in certain of these parameters in individuals of species of the genus Calanus and related genera and the ecogeographic conditions of latitutinal oceanic zones. Degrees of primitiveness or specialization were assessed on the basis of these relationships. A key to species is given. A new species, Calunus (Carinocalanus) macrocarinatus, is described. (See also W77-00393) (Buchanan-Davidson--Wisconsin)
W77-00394

ZOOPLANKTON OF DIKSON BAY (KARA SEA),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
L. L. Chistenko.
In: Geographical and Seasonal Variability of Marine Plankton, TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,' Leningradskoe Otdelente, Leningrad, 1972. B. E. Bukhovskii, editor, p. 263-274. 3 fig., 3 tab., 10 ref.

Descriptors: *Marine microorganisms, *Zooplankton, *Temporal distribution, *Arctic Ocean, Varieties, Annelids, Dominant organisms, Biological communities, Biomass, Copepods, Mollusks, Crustaceans. *Bays.
Identifiers: *Dikson Bay(USSR), *Kara Sea.

Seasonal changes in zooplankton were studied in the high Arctic area of Dikson Bay (Kara Sea) in 1955-1957. In the 48 zooplankton forms found, 28 species were determined--twenty species were marine, five species brackish-water, and three species freshwater forms. The marine forms were largely neritic coldwater Arctic species, but oceanic species were fairly abundant in the plankton. The brackish-water forms were autochthonous to the brackish Arctic waters; three were endemic to the high Arctic. Freshwater organisms were qualitatively and quantitatively small. The average biomass was 121 mg/cu m. The percentage composition of the average biomass was Copepoda 55.8% (Calanoids 53.5%), Chaetognatha 18.6%, Mollusca 13.3%, higher Crustacea 4.2%, Polychaeta 3.3%, Hydromedusae 1.9%, and other organisms 2.9%. Of the total zooplankton biomass, Sagitta accounted for 18.6%, Limnocalanus grimaldii, 17.4%, Calanus galacialis 13.7%, Pseudocalanus elongatus 7%,and Drepanopus bungei 7%. A springtime state of plankton was observed before onset of the thaw when the water was still frozen. There was no partial resumption of springtime processes during fall homothermy. Extremely variable hydrologic conditions in this area complicated the pattern of seasonal biological processes. (See also W77-00393) (Buchanan-Davidson--Wisconsin)
W77-00395

STRUCTURE OF THE MANDIBLES IN THE GENUS CALANUS S.L. IN RELATION TO LATITUDINAL ZONALITY,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
N. V. Vyshkvartseva.
In: Geographic and Seasonal Variability of Marine Plankton, TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,' Leningradskoe Otdelente, Leningrad, 1972. B. E. Bykhovskii, editor, p. 186-199. 9 fig., 1 tab., 20 ref. 46 ref.

Descriptors: *Marine microorganisms, *Copepods, *Phylogeny, *Latitudinal studies, *Diets, Oceans, Climatic zones, Ecotypes, Systematics, Crustaceans, Fish food organisms, Distribution.
Identifiers: *Calanus, Mandibles.

To determine the presence, degree, and causes o differentiation of mouth parts of a single genus twelve Calanus species were collected fro oceans. The masticatory edge of the mandible wa examined in each specimen. All species showe asymmetry of form of teeth C-1 and C-2 on bot mandibles and of the masticatory edge width. Ve tral teeth varied in Calanus species collected in di ferent zoogeographic regions. Species from hig latitudes in northern and southern hemisphere had two ventral teeth, V-1 and V-2. In specie from northern and southern temperate region tooth V-2 was only slightly developed or absen but there was a cuticular tubercle at the base o tooth V-1. Species from tropical regions had a si gle tooth, V-1. Ventral tooth differences were co related with differences in dietary composition i different regions. The food consumed was mostl diatoms in higher latitudes, but the proportion o flagellates in phytoplankton and consequently i crustacean diets increased toward the tropics. A the species level, there was a relationship betwee characteristic features of the range and compos tion of ventral teeth. Morphological specializatio of mandibles in this genus was accompanied b oligomerization of teeth numbers, but this proce was apparently not complete in some species. SEASONAL CHANGES OF ANTARCTI PLANKTON IN THE MOLODEZHAYA AN MIRNY REGION,
Akademiya Nauk SSSR, Leningrad. Zoologi neskii Institut.
A. Zvereva.
In: Geographical and Seasonal Variability Marine Plankton, TT-74-50030, 1975. Translate from Izdatelstvo 'Nauka,' Leningradskoe Otd lente, Leningrad, 1972. B. E. Bukhovskii, edito p. 248-262. 6 fig., 5 tab., 4 ref. 7 ref.

Descriptors: *Marine microorganisms, *Tempor distribution, *Antarctic Ocean, *Copepod Zooplankton, Dominant organisms, Period growth, Varieties.
Identifiers: *Mirny Station(Antarctic Ocean *Molodezhnaya Station (Antaractic Ocean).

Seasonal changes in Antarctic plankton were st died in samples collected at the Soviet stations Mirny and Molodezhnaya in 1958 and 1965-196 Hydrological data and species of copepods fou were recorded. In both areas, the most comm species found were Oithona similis, Ctenocalan vanus, Oncaea curvata, Calanoides acutu Calanus propinquus, Stephus longipes, Metrid lucens, and M. gerlachei in decreasing numbe Other species occurred irregularly in small nu bers. Immature forms were found in January, a males and females appeared in February-Marc In September there wasan increase in speci diversity and mature individuals. Immatu specimens of some species were absent in O tober, but in some species both immature and m ture forms were always present. The Molodez naya plankton was richer in species than the Mir plankton in which Microcalanus pygmae Racovitzanus antarcticus, Scaphocalan brevicornis, and Paralabidocera antarctica we not found. There were peaks of species diversi in January-February and September-October. T September-October peak contained male, fema and copepodid stages IV-V of most species. The was an increase in the volume of plankton/u water volume in January. The copopod spec found at these stations are listed and their matu ty, sexual and temporal distribution indicate (See also W77-00393) (Buchanan-Davis Wisconsin).

OLOGICAL SEASONS IN THE ZOOPLANK-ON OF DAVIS STRAIT,
kademiya Nauk SSSR, Leningrad. ologicheskii Institut.
A. Pavshtiks.
: Geographical and Seasonal Variability of arine Plankton, TT-74-50030, 1975. Translated m Izdatelstvo 'Nauka,' Leningradskoe Otde-ite, Leningrad, 1972. B. E. Bykhovskii, editor, 200-247. 15 fig., 12 tab., 33 ref. 24 ref.

escriptors: *Marine microorganisms, *Seasonal, opepods, *Biomass, Zooplankton, Biological mmunities, *Atlantic Ocean, Arctic Ocean, ean currents, Varieties, Fish food organisms, fe cycles, Spawning, Distribution, Canada.
entifiers: *Davis Strait(North Atlantic Ocean), ninger current, Calanus finmarchicus, Calanus cialis.

oplankton samples were collected from the vis Strait bordering Canada's Baffin Island and eenland, in 1962-1964. In terms of abundance d biomass, Calanus finmarchicus, C. hyper-reus, Metridia longa, Pareuchaeta norvegica, thona similis, Oncaea borealis, Thysanoessa gicaudata, Limacina retroverse, and L. helicina re predominant. About 100 other species oc-rred less frequently and did not appreciably af-ct seasonal changes in total abundance and mass. Sometimes Aglantha digitale, enophora, larvae of benthic animals, etc. edominated. The continuous presence of C. fin-archicus and Oithona similis indicated the boreal ture of the fauna. Atlantic waters reach the vis Strait in the Irminger Current which is in-bited by C. finmarchicus and Pareuchaeta nor-gica juveniles. Arctic water indicators were C. perboreus, Metridia longa, and Limacina licina. Water temperature fluctuations in-enced abundance, biomass, and zooplankton velopment schedules. Biological seasons started different times and were of different durations parts of the strait influenced by different water sses. Ice often interfered with spring spawning ocesses. The biological season affected plank-ic population size more than species composi-n. Planktonic abundances increased with onset biological spring and remained relatively changed until fall, but relative numbers and mass of some zooplankton varied. Davis Strait oplankton showed similarities to fauna of other rthern waters influenced by the North Atlantic rrent. (See also W77-00393) (Buchanan-David-n--Wisconsin)

ECIES COMPOSITION AND DISTRIBUTION ECOLOGICAL COMPLEXES OF OPLANKTON IN THE ENISEI GULF,
ademiya Nauk SSSR, Leningrad. ologicheskii Institut.
L. Chislenko.
Geographical and Seasonal Variability of rine Plankton, TT-74-50030, 1975. Translated m Izdatelstvo 'Nauka,' Leningradskoe Otde-te, Leningrad, 1972. B. E. Bukhovskii, editor, 75-301. 21 fig., 7 tab., 18 ref.

scriptors: *Marine microorganisms, * Ecologi-distribution, *Temporal distribution, oplankton, Hydrologic properties, Dominant anisms, Biological communities, Saline-fresh-er interfaces, Gulfs, Arctic, Biomass.
ntifiers: *Enisei Gulf(Kara Sea).

: ecology and distribution of zooplankton in the sei Gulf on the Kara Sea were studied during 5-1956. Synchronous hydrological determina-ıs were also made. Among the 84 forms found, species were identified: 23 marine species, 7 ckish-water species, and 40 freshwater species. h form is described and its life stage and onse to temperature and salinity recorded. h zooplankton complex may predominate for a ain time and may be separated from the others ically and horizontally. The marine complex consisted mostly of neritic coldwater Arctic species. The Enisei Gulf also contained some oceanic species, especially in the winter. The brackish-water forms were all autochthonous to the brackish Arctic waters; four were endemic to the high Arctic. The freshwater fauna were richest in species but its biomass was much smaller than that of the brackish complex and its existence in the gulf shorter than that of the marine complex. The brackish-water complex was the least diverse qualitatively but predominated quantitatively due to its adaptation to environmental conditions. Zooplankton distribution and development depend largely on hydrologic conditions which vary seasonally and annually. The Enisei Gulf is a typical monocylic polar water body. The biological fall season is not expressed in the zooplankton. (See also W77-00393) (Buchanan-Davidson--Wisconsin).
W77-00399

GEOGRAPHICAL VARIABILITY OF SOME SPECIES OF THE FAMILY OITHONIDAE (COPEPODA, CYCLOPOIDA),
Akademiya Nauk SSSR, Leningrad. Zoologic-neskii Institut.
V. S. Shuvalov.
In: Geographic and Seasonal Variability of Marine Plankton, TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,' Leningradskoe Otdelente, Leningrad, 1972. B. E. Bykhovskii, editor, p. 169-186. 9 fig., 1 tab., 15 ref. 46 ref.

Descriptors: *Marine microorganisms, *Geographic regions, *Copepods, *Ecological distribution, *Phylogeny, Oceans, Zooplankton, Ocean currents, Variability, Atlantic Ocean, Arctic Ocean, Tropical regions, Temperate, Ecotypes.
Identifiers: *Oithona similis, Oithona atlantica, Oithona plumifera, White Sea, Sea of Okhotsk, Mediterranean Sea, Gulf of Mexico.

Planktonic organisms can serve as biological indicators of hydrological regimes, water masses, currents, and zoogeographic regions. Variations in body size and morphological characters were measured in Oithona similis, 0. atlantica, and 0. plumifera collected from different oceans. Two sizes of 0. similis were distinguished--a small Atlantic-White Sea group and a large Arctic-Sea of Okhotsk group. Configurations of the rostrum and cephalothorax varied, but not the limbs or armature. Vertical and horizontal size variations occurred due to Artic water inflow. 0. similis lives under a wide range of conditions but is composed of infraspecific forms and groups, each confined to a relatively limited range of factors. 0. plumifera and 0. atlantica were closely related but independent. 0. atlantica was a boreal species inhabiting the North Atlantic, Mediterranean, and northern Gulf of Mexico temperate zones, while 0. plumifera was a tropical species. 0. atlantica size and antennule length gradually decreased from north to south in the northern hemisphere; this was reversed in the southern hemisphere. 0. plumifera varied in hairiness and length of setae on basipodites of the swimming feet, antennules, and furcal rami. Diversity of environmental conditions can cause development of adaptive features in plankton. (See also W77-00393) (Buchanan-Davidson--Wisconsin)
W77-00400

INTRASPECIFIC DIFFERENTIATION OF CALANUS PLUMCHRUS MARUKAWA,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
M. S. Kos.
In: Geographic and Seasonal Variability of Marine Plankton, TT-74-50030, 1975. Translated from Izdatelstvo 'Nauka,' Leningradskoe Otdelente, Leningrad, 1972. B. E. Bykhovskii, editor, p. 128-168. 28 fig., 5 tab., 63 ref. 46 ref.

Descriptors: *Marine microorganisms, *Speciation, *Phylogeny, *Copepods, Ecological distribution, Oceans, *Pacific Ocean, Animal populations, Systematics, Geographical regions, Seasonal, Ocean currents, Zooplankton, Ecotypes.
Identifiers: *Calanus plumchrus, USSR.

Calanus plumchrus is one of the most abundant and widespread species of copepods in the North Pacific Ocean and the Eastern seas of the USSR. Population analyses were made of over a 1000 specimens from different parts of its range. Twenty-two characters (morphological characteristics, measurements of body parts, etc.) were studied for each specimen. Comparative analysis showed that these characters varied in populations from geographically remote regions but not seasonally in a given region. Significant differences were observed between many of the characters concerning morphological features of females and, to a lesser extent, males. Comparative morphological analysis of intraspecific variability demonstrated the polymorphism of this species. Intraspecific categories could be detected only in sexually mature forms. The northwestern population was a specific form distinct from the northeastern and northern forms; it had a defined range, and the male, and especially the female, had characteristic structural features. Overlapping of intermediate forms in these ranges never exceeded 25%. Intraspecific differentiation depended mainly on geographic distance, while differences in currents and water mass distribution played smaller roles. The comparatively weak expression of intraspecific differentiation in C. plumchrus was attributed to the relative homogeneity of the hydrological conditions in the North Pacific. (See also W77-00393) (Buchanan-Davidson--Wisconsin).
W77-00401

PROXIMATE NUTRITIVE VALUE CHANGES DURING DECOMPOSITION OF SALT MARSH PLANTS,
Mississippi State Univ., Mississippi State.
A. A. de la. Cruz.
Hydrobiologia, Vol. 47, No. 3-4, p. 475-480, 1975. 2 tab., 10 ref. NOAA-SG 2-35362, NSF GA-35715.

Descriptors: *Halophytes, *Tidal marshes, *Productivity, Degradation(Decomposition), Detritus, Proteins, Carbohydrates, *Decomposing organic matter, Bulrushes, Mississippi, Fibers(Plant), Lipids, Salt marshes.
Identifiers: Giant cordgrass, Salt grass.

Caloric and nutritive values were determined for giant cordgrass (Spartina cynosuroides), salt grass (Distichlis spicata), and bulrush (Scirpus americanus), which are the dominate vascular plants in Mississippi coastal tidal marshes, during their decomposition to particulate detritus. Decomposition of materials enclosed in nylon-mesh bags occurred faster when submerged. The combustible organic content (ash-free dry weight) of live young plants was lower than that of adult plants; ash-free values of detritus were 63-72% of live plant values. Caloric values of detritus increased slightly. Crude fiber, carbohydrate, and fat contents declined in the detritus. Protein increased in detritus by asmuch as 96% in Scirpus, 99% in Spartina, and 300% in Distichlis. Marsh plant detritus is a nutritional source of food for estuarine consumers and may be even nutritionally higher than live plants, since they contain less indigestible crude fiber and cellulose. Absorption and/or adsorption of dissolved nutrients to decaying plant matter enhances retention of relatively high organic concentrations, leading to protein and energy retention or increase in the particulate detritus. (Buchanan-Davidson--Wisconsin).

EFFECT OF THE DISCHARGE WATERS OF THE TRIPOL'E THERMAL ELECTRIC STA-

TION OF THE THERMAL REGIME OF THE DNIEPER, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Instytut Hidrobiologii.
N. V. Pikush.
Gidrobiol Zh. 11(1), p 79-81, 1975.

Descriptors: Rivers, *Thermal powerplants, *Thermal pollution, Heated water, Water pollution sources, Effluents, Mixing, Regime, Cooling water.
Identifiers: *Dnieper River, Electric, *USSR, Waters.

Ten hydrothermal surveys were carried out in 1970-1972 on the Dnieper River (USSR) from 3 km above the Tripol'e thermal electric station to 120 km downstream from it. During the 1st 3 yr of operation the average daily discharge of heated waters varid from 8.3-53.4 m3/s and the discharge in the Dnieper varied within 500-18,400 m3/s. As a consequence of this variation mixing and cooling occurred at different distances from the discharge point.--Copyright 1976, Biological Abstracts, Inc.

CHANGES IN THE CHIRONOMID FAUNA CAUSED BY DAMMING THE DANUBE, (IN GERMAN),
Institute for Biological Research, Belgrade (Yugoslavia).
M. Jankovic.
Arch Hydrobiol Supplementb. 44(4), p 462-479, 1975.

Descriptors: *Sampling, *Reservoirs, Aquatic fauna, Population, *Plant populations, *Diptera, *Post-impoundment.
Identifiers: Chironomus-plumosus, Chironomus-thummi-F-fluviatilis, Crypto-chironomus, *Danube River, *Yugoslavia.

Out of 29 spp. that occurred in the Danube, only 15 were found in the Djerdap Reservoir (Yugoslavia). The rheophilous forms disappeared first, primarily the scarce psammorhe-ophilous species from the genus Cryptochironomus and later the more abundant psammo- and lithortheophilous species. Most Chironomidae are lacustrine and mainly pelophilous species. Intensive development of Chironomus f. l. plumosus was observed. In contrast, C.f.l. thummi f. fluviatilis decreases gradually in number parallel to the diminishing flow in the basin.--Copyright 1976, Biological Abstracts, Inc.

THE NUTRIENTS AND PLANTS OF LAKE JOONDALUP, A MILDLY EUTROPHIC LAKE EXPERIENCING LARGE SEASONAL CHANGES IN VOLUME,
Western Australia Univ., Nedlands. Dept. of Botany.
R. A. Congdon, and A. J. McComb.
Journal of the Royal Society of Western Australia, Vol 59 Part 1, p 14-23, May 1976. 11 fig, 3 tab, 24 ref.

Descriptors: *Lakes, *Lake shores, *Eutrophication, *Baseline studies, *Algae, Urbanization, Water chemistry, Aquatic productivity, Primary productivity, Trophic level, *Nutrients, Nitrogen, Phosphorus, Seasonal, Vegetation, *Australia, Aquatic plants, Water pollution effects.
Identifiers: *Lake Joondalup(W.A.).

Lake Joondalup is one of a chain of lakes to the north of Perth, Western Australia, in a calcareous stable dune system 6 km from the ocean. The region is subject to rapid urbanization and development. A study was undertaken to record the seasonal fluctuations in nutrients and algal density of the lake, with a description of the fringing vegetation, to provide a reference against which future changes may be assessed. Cation ratios in the lake resemble seawater apart from relatively high calcium; seasonal changes in water volume greatly affect ionic concentration. A bloom of the green alga Dispora coincides with low volume and high ion levels. Total nitrogen is high compared to phosphorus, and the data give indications that phosphorus levels may limit algal productivity in the lake. (CSIRO)
W77-00442

YELLOW SUBSTANCE (GELBSTOFF) AND ITS CONTRIBUTION TO THE ATTENUATION OF PHOTOSYNTHETICALLY ACTIVE RADIATION IN SOME INLAND AND COASTAL SOUTH-EASTERN AUSTRALIAN WATERS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. T. O. Kirk.
Australian Journal of Marine and Freshwater Research, Vol. 27, No. 1, p 61-71, March 1976. 4 fig, 3 tab, 17 ref.

Descriptors: *Pigments, *Light penetration, *Photosynthesis, Aquatic environment, *Australia, Freshwater, Sea water, Light quality, Lakes, Reservoirs, Bays, Rivers, Water pollution effects.
Identifiers: Lake Ginninderra(A.C.T.), Lake Burley Griffin(A.C.T.), Lake George(N.S.W.), Cotter Dam(A.C.T.), Burrinjuck Dam(N.S.W.), Clyde River(N.S.W.), Bateman's Bay(N.S.W.), *Gelbstoff.

The absorption spectra relative to distilled water of samples from various inland and coastal waters in south-eastern Australia (lake, reservoir, river and bay) have been measured. Amongst the freshwater samples the level of dissolved yellow substance (gelbstoff) was found to vary seven-fold; in coastal water the concentration was much lower than in any of the freshwater samples. In the inland waters yellow substance has a dominating influence on light penetration, and the blue region of the spectrum is abolished at quite moderat depths. In all cases except seawater it was calcu lated that most of the quanta captured are ab sorbed by yellow substance rather than by wate An alternative name, gilvin, is suggested for th yellow pigments in natural waters. (CSIRO)
W77-00448

NUTRIENT STATUS OF THE SEDIMENTS I LAKE MULWALA. I. TOTAL PHOSPHORUS,
Caulfield Inst. of Tech. (Australia). Dept Chemistry.
B. T. Hart, R. J. McGregor, and W. S. Perriman.
Australian Journal of Marine and Freshwat Research, Vol 27, No. 1, p 129 - 135, March 1976. fig., 3 tab., 18 ref.

Descriptors: *Phosphorus, *Lake sedimen *Australia, *Nutrients, Lakes, Urbanizatio Eutrophication, Water pollution effects.
Identifiers: Lake Mulwala(N.S.W.-Vic.).

Chemical analyses are reported for sediment sa ples taken from Lake Mulwala, a man-made la in the River Murray (Australia), downstream fr a proposed area of urban growth. The sedimen are non-calcareous and high in clay content. To phosphorus levels were found to be of the sa order of magnitude as values reported f eutrophic lakes in other countries. Statistical an ysis of the data has allowed the calculation o predictive model for total phosphorus levels in t lake sediments. Total phosphorus was found to influenced by location within the lake, orga content of the sediments and water depth. On t basis of total phosphorus levels, the lake can be vided into two regions - an upper region influenc by the two input rivers, which has lower levels total phosphorus, and a lower region with hig levels of sediment phosphorus. It appears t about 50% of this total phosphorus is potentia available for exchange with the water colun (CSIRO)

NUTRIENT ECONOMIES AND TROPH STATUS OF LAKES SORELL AND CRESCEN TASMANIA (AUSTRALIA),
Tasmania Univ., Hobart (Australia). Dept. Botany.
D. M. H. Cheng, and P. A. Tyler.
Australian Journal of Marine and Freshwa Research, Vol 27, No 1, p 151-163, March 197 fig, 7 tab, 15 ref.

Descriptors: *Nutrients, *Lakes, *Austra *Tripton, *Eutrophication, Algae, Phytoplankt Primary productivity, Nitrogen, Phosphorus, icates, Carbonates, Trace elements, Watersh management, Recreation, *Trophic level, Wa pollution effects.
Identifiers: Lake Sorell(Tas), Lake Crescent(Ta Tasmania.

Lakes Sorell and Crescent are shallow, polyu tic, connected lakes with fundamentally sim physicochemical limnology, but markedly c trasting algal populations and phytoplank biomass. Investigations are described wh sought an explanation in terms of nutrient eco mies for the biotic contrast. The effects of nutri enrichment with nitrogen, phosphorus, carbon silicate, trace elements and chelates, and of trip removal, on Carbon-14 uptake in incubated s ples were determined. It is concluded that greater productivity and greater plankton biom of Lake Crescent rests on its greater tripton lo derived from greater scouring of sediments, flow through from Lake Sorell and an abund fringing marshland. It is likely that the distinc floras of the two lakes are adapted to the diffe nutrient conditions, so that flow-through inoc of Lake Sorell algae cannot become establishe Lake Crescent. As the lakes are alre mesotrophic and eutrophic respectively, mana ment plans for this recreational area should see limit nutrient inputs. (CSIRO)

CONSUMPTION OF ORGANIC MATTER OF MUDS BY ILYOCRYPTUS SORDIDUS (CLADOCERA, MACROTHRICIDAE), (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
Z. N. Chirkova, and V. I. Romanenko.
Gidrobiol Zh. 9(5), p 63-67, 1973.

Descriptors: *Reservoirs, *Bottom sediments, Feeding rates, *Biomass, *Organic matter, Sands, Mud, Silts, *Crustaceans, Lake sediments.
Identifiers: *Ilyocryptus-Sordidus, Macrothricidae, USSR, Rybinsk reservoir, Volga.

Aquarium experiments with Ilyocryptus sordidus on gray, peaty and sandy muds and pure sand collected from various places of the Rybinsk reservoir on the Volga (USSR) showed that the nonuniform distribution of the cladoceran in the reservoir is due to the food value of the bottom deposits. The main factor limiting the distribution of I. sordidus in the reservoir is the weak silting of the flooded soils and the low content of organic matter on the slightly silted areas. When calculating the intensity of feeding and biomass production of Ilyocryptus, (as much as 99% of the total number of cladocerans of the family Macrothricidae), it is necessary to consider the character of the bottom deposits and their organic matter content.--Copyright 1975, Biological Abstracts, Inc.

POTAMOGETON PERFOLIATUS IN A BRACKISH-WATER ESTUARY AT ORA, FREDRIKSTAD (S. NORWAY), (IN NORWEGIAN),
Norsk Institutt for Vannforskning, Blindern.
B. Rorslett.
Blyttia. 33(2), p 69-82, 1975.

Descriptors: *Estuaries, Salinity, Vegetation, *Brackish water, Analysis, Remote sensing, Europe, Water pollution effects.
Identifiers: *Fauna, *Flora, Fredrikstad, *Norway(Ora Estuary), *Potamogeton Perfoliatus, Ruppia.

The River Glama estuary at Fredrikstad, S Norway has a rich flora and fauna. The brackish-water area contains a mixture of marine and freshwater species. A municipal land-reclamation project carried out about 1970 has markedly influenced the salinity of the Ora estuary. A general increase in the salinity level has led to vegetational changes. The submergent freshwater species P. perfoliatus, formerly abundant in the estuary, is rapidly disappearing, being replaced by the salinity-tolerant Ruppia. Remote sensing imagery acquired by IR falsecolor films and multispectral camera was used to map the present distribution of P. perfoliatus in the estuarine region. The colony pattern and development could be analyzed on the imagery. A gradual breakdown of the Potamogeton population by increasing salinity was demonstrated. In laboratory experiments, the salinity tolerance of P. perfoliatus was lower than 90%. Salinity values exceeding the tolerance level of P. perfoliatus are now frequently found in the estuarine waters.–Copyright 1975, Biological Abstracts, Inc.

SEASONAL SUCCESSION AND VERTICAL DISTRIBUTION OF PHYTOPLANKTON IN LAKE HAYES AND LAKE JOHNSON, SOUTH ISLAND, NEW ZEALAND,
Otago Univ., Dunedin (New Zealand). Dept. of Zoology.
Carolyn W. Burns, and S. F. Mitchell.
N Z J Mar Freshwater Res. 8(1), p 167-209, 1974.

Descriptors: *Lakes, *Australia, Algae, *Phytoplankton, Plankton, Diatoms, Chlorophyta, *Plant populations, Eutrophication, Water pollution effects.
Identifiers: Anabaena-flos-aquae, Closterium-aciculare, Clostrium-acutum-var-variabile, Cryptomonas, Cyclotella-kuetzingiana, Hayes Lake, Melosira-granulata, *New Zealand, Peridinium-cinctum, Staurastrum-bibrachiatum, Staurastrum-Spp.

In 2 small monomictic lakes near Queenstown, South Island, New Zealand, algal associations characteristic of eutrophic waters were present throughout most of the period from Dec. 1969-Feb. 1972. Melosira granulata dominated the plankton in winter; at other times of the year Closterium aciculare, Cyclotella kuetzingiana, and Staurastrum spp. were dominant. In Lake Johnson, the major algae differed from 1 yr to another. Blooms of A. flos-aquae formed during the 1st two summers but were absent in the third, when Closterium acutum var. variabile was dominant. Peridinium cinctum was abundant throughout the 1st yr, especially in December 1969 and October 1970, when concentrations of more than 1000 cells/ml occurred at the surface. During autumn and winter of the 2nd yr, S. bibrachiatum dominated the plankton. In both lakes, micro-algae were abundant in late spring and early summer. In winter, when the lakes were isothermal, algae were distributed fairly uniformly with depth. During the period of thermal stratification, algae were mainly confined to the epilimnion. Although green algae and diatoms were usually dispersed fairly uniformly throughout this zone, Cryptomonas and Peridinium were often concentrated at a certain depth. In Lake Johnson in late summer 1971, a layer of purple phytosynthetic bacteria, of which concentrations of 0.5-1.3 x 106 cells/ml were recorded, was present at a depth of 7-8 m. The mean standing crop of algae for the trophogenic zone of Lake Hayes was 6000 cells/ml, and a maximum crop of 65,000 cells/ml was recorded in December 1971 during an Anabaena bloom: the mean volume of phytoplankton was 1.93 mm3 per litre for the trophogenic zone with a maximum of 7.49 mm3/l in Jan. 1970 when Anabaena and Peridinium were abundant. In Lake Johnson, the mean number of algae in the trophogenic zone was 11,000 cells/ml and the mean volume of phytoplankton was 9.37 mm3/l: a maximum volume of 33.12 mm3/l was recorded in Oct. 1970 when Peridinium was abundant. PROCEEDINGS OF THE 1975 NATIONAL CONFERENCE ON MUNICIPAL SLUDGE MANAGEMENT AND DISPOSAL.
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
August 18-20, 1975, Held at Anaheim, California, 257 p. Published in 1975 by Information Transfer, Inc., Rockville, Md.

Descriptors: *Waste water treatment, *Pollutant identification, *Treatment facilities, *Conferences, *Municipal wastes, *Sludge disposal, *Sludge, Management.

Various aspects of sludge treatment and disposal are discussed. Sludge disposal alternatives are considered for Philadelphia, Boston, Denver, and cities in general. The previous year's conference is updated, and another seminar is summarized. The disposal methods discussed include burning and disposal onto land. The discussion of land disposal includes its effects on plants, groundwater, and human health and its use in soil stabilization and improvement. Sludge digestion and treatment are also discussed. The treatment methods include the use of high energy radiation, heat drying, and composting. Other topics discussed include institutional problems of small treatment plants, a computer program to evaluate sludge handling and disposal costs, and energy conservation practices in municipal sludge management. (See W77-00010 thru W77-00038) (Snyder-FIRL)

INSTITUTIONAL PROBLEMS OF THE SMALL TREATMENT PLANT,
Environmental Quality Systems, Inc., Rockville, Md.
E. J. Martin, R. DuBois, and H. Bernard.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 23-25. 4 tab.

Descriptors: *Treatment facilities, *Waste water treatment, *Municipal wastes, *Sludge treatment, *Institutional constraints, Economics, Design criteria, Activated sludge, Waste treatment, Cities, Legislation.

Problems associated with the design of small municipal waste water treatment plants are discussed, with a specific example being described. The example involves the design of a 6 million gallon/day activated sludge treatment plant which subsequently failed to meet state and Federal requirements despite original projections for future capacity needs and legislative changes. Problems encountered with the plant included: no replication of sludge handling equipment, inadequate storage and sludge thickening, makeshift sludge transfer, questionable sludge filter capacity, the use of an activated sludge system for solids storage, and various difficulties associated with a heat treatment unit. Conflicting requirements between the city's ability to comply in terms of financial resources and state and Federal demands for upgrading are discussed. (See also W77-00009) (Kreager-FIRL)

COMPUTER EVALUATION OF SLUDGE HANDLING AND DISPOSAL COSTS,
Municipal Environmental Research Lab., Cincinnati, Ohio.
R. Smith, and R. G. Eilers.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 30-59. 13 fig, 6 tab, 20 ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Computer programs, *Municipal wastes, *Cost-benefit analysis, Management, Programs, Performance, Evaluation, Treatment facilities, Waste water treatment, Operating costs.

A digital computer program which is capable of examining the cost and performance of a wide variety of alternative sludge handling schemes for municipal waste water treatment plants is described. The basic computational program is known as the Executive program and contains a subroutine for each of the liqid and sludge treatment alternatives. It also contains rate and mass balance relationships necessary to generate the effluent stream vectors when one or more influent stream vectors are supplied together with certain decision variables. The subroutine sizes all structures and equipment and estimates the capital, operating, and maintenance costs associated with the process. The capability of the program is demonstrated for 261 alternative sludge treatment and disposal schemes. The program is designed to be used as a management tool to narrow the range of sludge treatment and disposal options when the site-specific conditions are known. (See also W77-00009) (Kreager-FIRL)

ENERGY CONSERVATION PRACTICES IN MUNICIPAL SLUDGE MANAGEMENT,
Public Technology, Inc., Washington, D. C.
G. W. Miller.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California p 91-100. 2 fig, 6 tab, 21 ref.

Descriptors: *Sludge treatment, *Waste water treatment, *Municipal wastes, *Cost analysis, *Digestion, Byproducts, Incineration, Conservation, Methane, Energy conversion, Treatment facilities.

Municipal inventories of energy consumption associated with waste watertreatment sludge management are reviewed in relation to conserving energy in such operations. Energy consumption in waste water treatment operations in general and for sludge disposal in particular is concluded to be a major consumer in municipal government operations. Larger waste water treatment plants that process sludge by anaerobic digestion can increase the cost-effectiveness of their operations by utilizing all of the digester gas. The digester gas can be used directly to operate equipment, can be used to generate electricity, or can be sold for commercial or industrial use. It is usually not practicle to sell methane gas produced by digestion if it is possible to utilize all of it within the plant. A detailed cost analysis of the value of retaining digestion when total incineration of raw sludge is possible is presented for a particular facility. (See also W77-0009) (Kreager-FIRL)

HIGH ENERGY RADIATION IN SLUDGE TREATMENT - STATUS AND PROSPECTS,
Environmental Protection Agency, Cincinnati, Ohio.
J. B. Farrell.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 123-133. 6 fig, 3 tab, 21 ref.

Descriptors: *Radiation, *Waste water treatment, *Sludge treatment, *Sewage, Microorganisms, Chemical oxygen demand, Economics, Chlorine, Oxygen, Heat, Waste treatment, Sewage sludge, Chlorides, *Radiation.

The use of high energy radiation for treating waste water and sewage sludge is discussed in terms of past experience and future prospects. Experimental work with sewage sludge indicates that high significant levels of microbial reduction occur at irradiation levels under 1.0 megarad. Cost studies indicate unrealistically high levels for sewage treatment but not necessarily for sludge. Synergistic effects on reductions in microbial levels appear to occur when radiation is combined with chlorine, heat, or zinc chloride. Radiation also reduces the chemical oxygen demand levels of aqueous solutions of certain chemicals at radiation levels less than 0.2 megarad, but much higher levels are required for significant effects with sewage. Radiation treatment apparently improves the settling rate and filterability of sewage sludge although the effect is not large. Future prospects for improving radiation effectiveness hinge around the effect of oxygen addition, although this approach may be limited by the solubility of oxygen in sludge. There is also the possibility of irradiating raw sludge for subsequent disposal into the ocean or for landspreading purposes. Major research programs dealing with radiation treatment of wastes are outlined. (See also W77-0000 (Kreager-FIRL)

MANAGEMENT OF MUNICIPAL WASTE WATER TREATMENT RESIDUALS,
National Science Foundation, Washington, D. C.
E. H. Bryan.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 1-138.

Descriptors: *Waste water treatment, *Sludge treatment, *Research priorities, *Municipal wastes, Model studies, Injection wells, Radiation, Viruses, Nutrients, Management, Simulation analysis, Domestic wastes, Industrial wastes, Economics, Land use.

Research projects sponsored by the National Science Foundation and dealing with the management of municipal waste water treatment residuals are reviewed. The projects involve the following: the design of a tractor-implement for injecting sludge into soil at a rate of up to 800 gallons/minute; the development of an analytical model of subsurface injection; the potential use of high-energy electrons for the disinfection of municipal waste water treatment residuals; the extent of virus survival in soils subjected to municipal sludge application; the control of virus pathogens by irradiation; the process selection for optimum management of regional waste water treatment residuals; the potential utilization of wetlands for their ability to remove nutrients from domestic waste water that has received secondary treatment; the use of simulation to provide a better understanding of water, nutrient, and general ecosystem functions; the use of injection wells for industrial waste management; and the relationships between regionalization of waste water systems and economies of scale. PLANT UPTAKE OF HEAVY METALS FROM SEWAGE SLUDGE APPLIED TO LAND,
Department of Agriculture, Beltsville, Md.
R. L. Chaney, M. C. White, and P. W. Simon.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 169-178. 7 fig, 10 tab, 31 ref.

Descriptors: *Sludge disposal, *Plant tissues, *Heavy metals, *Food chains, *Cadmium, *Toxicity, Soil analysis, Soil chemistry, Soil treatment, Zinc.
Identifiers: Composting.

Field and greenhouse experiments with sludge and composted sludge as well as studies involving the analysis of sludges currently applied to agricultural land conducted to investigate potential hazards associated with heavy metal uptake by plants. The results indicated that composting reduced the sludge metal availability to plants in addition to being desirable from the standpoint of pathogen reduction, odor control, drying, and ease of handling. Composting also generally produced a material which initially raised the soil pH and did not cause as much subsequent slow lowering of soil pH as digested sludge did. Plant cadmium uptake was extremely complex, depending on such factors as soil cadmium level, soil pH, the levels of other heavy metals in the soil, plant species and variety, and temperature. The experimental results indicate that the food chain should be adequately protected from sludge-borne cadmium if sludge use on cropland is restricted to only those sludges with a cadmium level equal to or less than 1% of the zinc content. A SUMMARY OF OBSERVATIONS ON THERMOPHILIC DIGESTER OPERATIONS,
Los Angeles Sanitation Bureau, Playa del Rey, Calif. Hyperion Treatment Plant.
G. T. Ohara, and J. E. Colbaugh.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 218-226. 10 fig, 9 tab, 4 ref.

Descriptors: *Waste water treatment, *Chemical oxygen demand, *Treatment facilities, *Sludge digestion, *Thermophilic bacteria, Investigations, Dewatering, Methane.
Identifiers: *Thermophilic digestion.

Observations made while investigating two applications of thermophilic sludge digestion are reported. The applications concern the enhancement of the sludge dewatering process under certain conditions when thermophilically digested sludge is used instead of mesophilically digested sludge and methane gas production during thermophilic digestion in comparison to mesophilic digestion. The investigations were conducted at a Los Angeles treatment plant. Thermophilically digested sludge and a solid bowl centrifuge produced a drier sludge cake, contained less suspended material in the centrate, required less chemical conditions than mesophilic sludge, and permitted a higher sludge feed rate. This combination was the only one to essentially meet all the dewatering requirements. Heating digesters to 120 F for thermophilic digestion requires 69% more BTUs than heating them to 95F for mesophilic digestion. There is some evidence that the centrate from thermophilic sludges contains a greater amount of certain dissolved heavy metals. Also, centrate-filtrate from thermophilic sludges contained approximately 30% higher chemical oxygen demand (COD) than mesophilic centrate. Thermophilic bacteria appear more sensitive to loading and temperature changes than mesophilic bacteria. Thermophilic sludges were easier to dewater in some situations. Thermophilic particles are coarser than mesophilic particles. Volatile acid levels are 400-500 mg/liter in thermophilic digestion, compared to 100-200 mg/liter for mesophilic digestion. There is some evidence that methane gas production is higher and gas quality is lower for thermophilic digestion, when compared to mesophilic digestion. (See also W77-00009) (Snyder-FIRL)
W77-00035

UTILIZATION OF METHANE FROM SLUDGE DIGESTION,
Greeley and Hansen, Chicago, Ill.
S. K. Kapoor, and D. Newton
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 227-234. 3 fig, 1 tab, 27 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Methane, *Sludge digestion, Chemicals, Industrial production, Sewage treatment, Economic efficiency, Heating, Storage, Feasibility, Ammonia, Supply.
Identifiers: Chemical production, Methanol.

Numerous conventional uses of sludge gas are restated and the feasibility of sludge gas utilization for production of chemicals is discussed. It appears that both sludge gas utilization and production should be maximized. Increased energy requirements due to proposed secondary treatment at all plants call for more intensive use of sludge for plant purposes. Historical modes of sludge gas utilization are believed to be the most economical. These include generation of electricity; direct operation of pumps and blowers; and hot water or steam production for space heating, air-conditioning, and digester heating. In-plant storage will help increase utilization by equalizing essentially diurnal fluctuation in supply and demand. In some places, the conventional uses may not be feasible; use of sludge gas to produce ammonia or methanol for in-plant use should be investigated. If applicable, ammonia can be used to fortify sludge for use as soil conditioner or fertilizer. In exceptional cases, sludge gas has been effectively sold to a gas-using industry or utility. Commercial use of sludge gas is likely to become more cost effective as natural gas and other energy sources diminish in supply and become more expensive. (See also W77-00009) (Snyder-FIRL)
W77-00036

PROCESSING, ECONOMICS AND SALE OF HEAT DRIED SLUDGE,
Environmental Protection Agency, Cincinnati, Ohio.
G. Stern.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 235-244. 4 fig, 7 tab, 34 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Economics, *Drying, Municipal wastes, Waste water(Pollution), Heat treatment, Horticulture.

Heat drying of municipal waste water sludge is reassessed. Undigested sludge can be heat treated to produce a useful product for agriculture and horticulture. Heat drying destroys most of the bacteria. Various types of direct heat dryers can be used. The energy requirements for producing equivalent amounts of nitrogen from sludge or commercial fertilizer can be comparable. While expensive, heat drying can be a relatively cheaper alternative to sludge disposal for many municipalities if the final product can be successfully marketed. Trends indicate that over one-third of the sludge to be produced in 1985 will be waste activated sludge, the kind that has been successfully marketed. Heat dried sludge sales are directed toward four major markets: industrial fertilizer compounders, citrus growers, nursery/horticulture/turf grass markets, and retail sales. Heat dried sludge offers slow-release organic nitrogen, other organics that improve the physical structure of soils, and trace elements such as zinc. Marketing heat dried sludge might best be done by a commercial firm. The rapid increase in commercial fertilizer cost is an added incentive to using heat dried sludge. W77-00037

COMPOSTING RAW SLUDGE,
Agricultural Research Service, Beltsville, Md.
E. Epstein, and G. B. Willson.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 245-248. 2 fig, 2 tab, 8 ref.

Descriptors: *Treatment facilities, *Sewage sludge, *Aeration, *Air, *Air circulation, Odor, Gases, Temperature, Monitoring, Sewage treatment, Waste water treatment, Equipment.
Identifiers: *Composting, Compost.

Since windrow composting of raw sludge was previously tried and proved unsatisfactory, a forced aeration method was developed. The forced aeration system uses a pile of raw sludge mixed with woodchips or shredded bark to provide bulk. A vacuum is used to draw air through the pile. The pile is covered with finely screened compost from previous operations to prevent odoriferous gases from escaping into the atmosphere. Gases removed from the pile are scrubbed by passing through another pile of screened compost. This method of composting shows promise for controlling the odors associated with windrow composting of raw sewage sludge. The covering of screened compost ensures that all of the raw sludge reaches temperatures above the thermal death point of most pathogens. Measuring temperature and oxygen is the only monitoring required. The method can be adapted readily for use by either large or small sewage treatment plants. It requires only a modest investment in equipment. (See also W77-00009) (Snyder-FIRL)
W77-00038

SLUDGE DRYING BEDS ARE PRACTICAL, PART 1,
J. A. Beardsley.
Water and Sewage Works, Vol. 123, No. 7, p 82-84, July, 1976.

Descriptors: *Sludge treatment, *Dewatering, *Design criteria, *Drainage systems, Pipelines, Drying, *Waste treatment, Materials, Performance.

The use of new designs and chemical treatment for reducing the space and labor required by sludge drying beds is discussed. Two distinct improved designs for sludge drying beds are emerging. The first is a full sand bed with the underdrain system improved so that the clay tile is not crushed by the weight of an end loader. Strong perforated plastic drainpipe or some other means can be used to protect the tile from the load. The second design involves alternating sand and cement strips, with the latter being spaced at wheel distances for the end loader. Provisions for draining surface water can be incorporated at intervals in the bed wall so that rainwater or free water released by chemical treatment may be quickly drained off. This is particularly important in modifying existing hard-bottom beds to optimize chemical use. (Kreager-FIRL)

CROSS-FLOW FILTRATION IN PHYSICAL-CHEMICAL TREATMENT OF MUNICIPAL SEWAGE EFFLUENTS,
Oak Ridge National Lab., Tenn.
H. A. Mahlman, W. G. Sisson, K. A. Kraus, and J. S. Johnson, Jr.
Report EPA-600/2-76-025, February, 1976. 127 p, 54 fig, 11 tab, 38 ref. ORNL/TM-5423.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, *Filtration, *Activated carbon, Biological treatment, Sewerage, Chemical precipitation, Tertiary treatment, Nutrient removal, Organic matter, Phosphates, Iron, Turbidity.
Identifiers: Cross-flow filtration.

Exploratory investigations were performed on the use of cross-flow filtration of primary and secondary municipal sewage effluents. In this approach, the solution being filtered is pumped parallel to the filter. Thickening of flux-limiting filtercake is slowed, and the original stream is separated into a large volume of filtrate and a concentrated slurry of solids. The effects of pressure, circulation velocity, additive concentration, water recovery, pH, and other variables were investigated. Filtrate from primary effluent treated with iron or aluminum salts, with powdered activated carbon (PAC), or with both hydrolyzable ions and PAC, was generally of quality superior in turbidity, organic carbon, and other respects to the effluent from biological secondary treatment. Turbidities were usually well below 1 JTU; bacteria were substantially removed. With iron or aluminum salts, filtrate total organic carbon (TOC) typically was 10 to 15 mg/liter, and phosphate below one mg/liter. With PAC, TOC was usually about 5 mg/liter, but phosphate removal was poor. With about 0.001 M iron(III) average fluxes of about 6 m/d appear attainable at 4.6 m/sec circulation velocity with 24 hr backwash intervals. Filtrate cost for a 3,800 cu m/d plant using iron salts was estimated at $.12/cu m. When feed is activated sludge secondary effluent, fluxes and product characteristics are similar, except that TOC is lower. With iron or aluminum salts, unless pH is adjusted to the neutral range before filtration, filtrate is substantially contaminated with the salts. An effluent low in phosphate and TOC was obtained by second-stage filtration of primary sewage filtrate treated with PAC and hydrolyzable ions. (Snyder-FIRL)

REVIEW OF THE MUNICIPAL WASTE WATER TREATMENT WORKS PROGRAM,
Environmental Protection Agency, Washington, D.C. Construction Grants Review Group.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 923, Price codes: A05 in paper copy, A01 in microfiche. EPA Miscellaneous Report, November 30, 1974. 93 p, 1 fig, 23 tab, append.

Descriptors: *Waste water treatment, *Treatment facilities, *Waste water(Pollution), *Waste treatment, *Programs, Municipal wastes, Grants, Construction.

The grants program for construction of municipal waste water treatment facilities is reviewed. An adequate program is defined. The many requirements were aggregated into the principal goal of achieving the most cost-effective abatement of municipal waste water pollution through the proper planning, design, construction, and operation of treatment works. This goal includes five subgoals: managing the program efficiently and with sufficient resources for adequate performance, ensuring that projects are constructed in a timely manner by expeditiously obligating funds, ensuring the environmental soundness of the projects by managing the environmental impact statement process effectively, detecting and deterring fraud and other irregularities, and protecting the responsibilities of the states in water pollution control. Cost-effectiveness is defined as including social, environmental, and non-monetary costs. One possible strategy summarizes the manpower requirements of the adequate strategy. It would permit a relatively high achievement of the cost-effectiveness goal and its subgoals. A second possible strategy would require less staff but could seriously sacrifice achievement of program goals. Two other possible strategies would reduce federal staffing needs, but would increase those of the states through the delegation of additional responsibilities. (Snyder-FIRL)

REMOVAL VS BENEFITS: IT CAN BE TOO COSTLY,
Kansas City Water and Pollution Control Depts., Mo.
D. R. Boyd, Jr., J. R. Popalisky, J. D. Reece, and D. McMurtrey.
Water and Wastes Engineering, Vol. 13, No. 2, p 42-44, February, 1976. 4 fig.

Descriptors: *Sewage treatment, *Nutrients, *Waste water treatment, *Water purification, *Water quality control, Missouri river, Missouri, Cities, Municipal wastes, Economics, Treatment facilities.

Complete nutrient removal at sewage treatment facilities discharging to the Missouri River is discussed in terms of the resulting benefits versus the costs. The volume of sewage at Kansas City is less than 1% of the minimum Missouri River flow in the area, and this fact combined with detection and removal of nutrients at the Kansas City water treatment facility where the volume of water requiring treatment for nutrient removal is less than 1.0% of the river flow is cited as reason for not removing nutrients at sewage treatment facilities. The quality of water currently in the Missouri River is such that advanced waste treatment for Kansas City would probably have an insignificant effect on the quality of the water in the receiving stream. DISCOUNTED CASH FLOW ANALYSIS TO SELECT EQUIPMENT,
Entech Corp., Dumont, N. J.
R. Briller.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE3, p 595-611, June, 1976. 6 tab, 2 ref.

Descriptors: *Cost analysis, *Waste water treatment, *Aeration, *Efficiencies, *Cost comparisons, Economics, Equipment, Operating costs, Capital costs.

discounted cash flow analysis method for select- waste water treatment equipment with the west overall cost is presented. Operating and pital costs as well as equipment life and discount e are used as input for a specific example in- lving surface aerators in a municipal sewage atment plant. Realistic values in terms of capital d operating costs, inflation rate, and other varia- s are also used in the example. The results show t an aerator which costs $5000 more but uses 4- orsepower less and one-fifth as much lubricat- oil is $5723 cheaper than another aerator in ms of the present value of the total overall sts. The most sensitive variable in the example the efficiency of the aerators. An improvement 4.2% in the efficiency of the cheaper aerator is fficient to eliminate the overall cost differential. general examination of the sensitivity analysis ed for the above example reveals that variables hich are less critical in the example problem can come more significant for cases where different lues of the independent variables are used. reager-FIRL)

mathematical model describing influent varia- lity removal in waste water treatment systems is esented. Input-output relationships for mpletely mixed basins, dispersed flow basins, d plug flow basins are developed using time-se- es analysis and transformation in the frequency main. The models describe equalization of con- ntration or waste load fluctuations assuming ear systems with first-order decay. Model- rived design formulas for purely random and rmonic inputs are obtained, assuming complete- mixed treatment systems. The model approach demonstrated and verified by an evaluation of e performance of two dispersion flow equaliza- n basins and completely mixed laboratory units. ie evaluation results indicate good agreement tween measured and computed equalization aracteristics. entifiers: *Filter backwashing, Backwashing .

potential flow model is used to study the flow of ckwash water (laden with filtered solids) in its ogress from the top of the filter bed to the wash- ter troughs above the filter. For a given trough acing, the round-bottom trough that minimizes the region of nonuniform flow above a filter bed is one with an external total width equal to 0.25 times the center-to-center spacing and with a total external draft equal to 0.20 times the center-to-center spacing. This design also promotes more efficient flushing of floc particles from the filter. Diminution of the nonuniform flow region and more efficient flushing can also be promoted by decreasing the trough spacing, but there are practical lower limits to trough spacing. Paths and travel times of fluid elements and suspended particles are investigated for the above optimal trough design and two alternative designs. (Kreager-FIRL)

WATER-REUSE SYSTEMS STAR AT CINCINNATI AICHE MEETING,
L. J. Ricci.
Chemical Engineering, Vol. 83, No. 15, p 86, 88, July 19, 1976. 1 fig.

Descriptors: *Water reuse, *Reclaimed water, *Waste water treatment, *Reclamation, *Symbiosis, Activated sludge, Reverse osmosis, Filtration, Adsorption, Ion exchange, Sludge, Industrial wastes, Phosphorus, Pilot plants, Organic compounds, Chemical wastes.
Identifiers: Ultrafiltration.

Laboratory and pilot-scale developments in water reuse systems are reviewed. A new pilot-scale scale system that renovates organic chemical-laden waste water for reuse in manufacturing operations is described that combines activated sludge treatment, physical/chemical treatment, reverse osmosis, and primary and secondary ion exchange. Another pilot unit has demonstrated the effectiveness of ultrafiltration for concentrating dilute latex waste waters for reuse. Laboratory studies have determined that certain natural and synthetic adsorbents are effective for removing leachate contaminants from various industrial sludges. The adsorption materials include fly ash, bottom ash, zeolite, vermiculite, illite, kaolinite, cullite, activated carbon, and activated alumina. Other laboratory studies have shown that flue gas desulfurization gypsum sludges hold potential as efficient removers of phosphorus from waste waters. However, undesirable contaminants such as sulfates in the sludge solubilize in the waste water and may cause environmental problems. (Kreager-FIRL)

AWT PLANT BEGINS OPERATIONS.
Public Works, Vol. 107, No. 8, p 104, August, 1976.

Descriptors: *Tertiary treatment, *Waste water treatment, *Reclamation, *Reclaimed water, *Treatment facilities, Activated sludge, Nitrification, Denitrification, Bacteria, Viruses, Suspended solids, Oxygen demand, Chlorination, Sewage, Storm water, Illinois, Municipal wastes, Cities, Ammonia, Nitrates, Nitrites, Nitrogen.
Identifiers: *Chicago(Ill).

An advanced waste water treatment plant owned by the Metropolitan Sanitary District of Greater Chicago is described. Plant design is based on a biological nitrification-denitrification process. A two-stage activated sludge treatment process is used to convert ammonia to nitrites and nitrates which eventually are released as nitrogen gas after the addition of methanol to assist the biological reaction. The resulting effluent is so low in oxygen demand, suspended solids, and viral and bacterial content that it meets all national pure water policy criteria and allows for downstream recreational uses. The facility will treat 50 million gallons/day of waste water from the Chicago suburbs of Schaumberg and Palatine as well as provide primary treatment and chlorination for approximately 100 million gallons/day of combined storm and sewage overflows before discharge to Salt Creek. ACTIVATED CARBON ODOR CONTROL SYSTEM,
Hagerstown Water Pollution Control, Md.
M. G. McGauhey, and R. L. Poltorak.
Public Works, Vol. 107, No. 7, p 47, July, 1976.

Descriptors: *Activated carbon, Odor, *Sludge, *Sewage treatment, Hydrogen sulfide, Organic compounds, Treatment facilities, Equipment, Costs.
Identifiers: Odor control.

An activated carbon system for removing sewage treatmet odors resulting from the conversion of two primary clarifiers to sludge thickeners is described. The thickeners are covered with an 80 by 30 foot gabled roof. Pressure gages are placed on the discharge lines to allow plant operators to adjust the level of air pressure without entering the covered area. A 10 by 10 foot carbon filter building houses fiberglass reinforced grid which is covered with a polypropylene mesh screen to retain 3000 pounds of granulated activated carbon. A 4000 cubic foot/minute blower draws the gases from the thickeners through the 3-foot bed of carbon where hydrogen sulfide and organic compounds are stripped from the air. An adjacent sludge well is also vented through the filter, correcting an additional odor problem. Equipment and component system costs amount to about $15,000. (Kreager-FIRL)
W77-00056

AUTOMATIC HIGH DENSITY SLUDGE DISCHARGE CONTROL USING ULTRASONICS.
Water Services, Vol. 80, No. 964, p 372, June, 1976. 2 fig.

Descriptors: *Waste water treatment, *Sludge treatment, *Automatic control, *Automation, *Density, Equipment, *Ultrasonics, Electrical equipment, Flow.

A high density sludge discharge controller which uses ultrasonics to automatically detect the level and density of raw sludge being transferred to digester or disposal systems and to minimize unwanted transfer of water is described. The sludge density controller which consists of a glass-lined pipe section fitted with two ultrasonic crystal sensors is installed in the sludge outlet line. The control unit may be mounted on the pipe section or located at a remote site. The plant process timer starts the transfer of sludge in accordance with a preset schedule by operating a pump or motorized valve. An external delay timer of several minutes duration overrides the function of the sludge density controller until the pipe is clear of low density sludge from the previous transfer cycle. Thick sludge then passes to the digester until the sludge density controller detects a decrease in percentage of solids being transferred. When the decreased percentage of solids continues to remain at less than the set point for more than 10 seconds, the sludge density controller operates to shut off the pump or valve. A sludge level control may also be incorporated into the system to detect and control the sludge level in settling tanks. (Kreager-FIRL)
W77-00058

WASTEWATER PLANT DESIGN REDUCES OFF-SITE ENERGY NEEDS.
Water and Sewage Works, Vol. 123, No. 2, p 41-43, February, 1976. 3 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Design criteria, *Energy conversion, Economics, Conservation, Municipal wastes, Sludge treatment, Methane, Sewage treatment.

A waste water treatment plant design that minimizes off-site energy requirement is described. The design is expected to result in a projected savings of $3594 in heating oil and $875 in electricity annually by the integrated use of

solar collectors, heat pumps, a small building shell, and basic concrete materials. Methane gas produced by the plant's waste treatment process and an electric generator will provide energy on cloudy days. The process design flow is for 450,000 gallons of sanitary sewage/day. Treatment is to be primary and secondary, including screening, bacteria-nutrient-oxygen-interfacing, settlement, and sludge digestion. The effluents will consist of chlorinated water and dewatered sludge. The plant is designed to service a community of 4200 residents. (Kreager-FIRL)
W77-00059

OXYGEN FOR EFFLUENT TREATMENT.
Water Services, Vol. 80, No. 964, p 379-380, June, 1976. 2 fig.

Descriptors: *Oxygenation, *Activated sludge, *Waste water treatment, *Bubbles, Equipment, Treatment facilities, Performance, Waste treatment, Liquid wastes, Biological treatment.
Identifiers: Sludge bulking.

The use of oxygen injection for improving effluent treatment is discussed. Two oxygenation systems currently available are described. In one of these systems, bubbles are generated by introducing oxygen in fine bubble form using a high pressure stream of liquor. When the water and gas enter a sludge tank through expansion nozzles, the already small bubbles are shattered into millions of quickly dissolving micro-bubbles. The other system is a bell-shaped diffusor which achieves highly efficient dissolution by maintaining a suspension of bubbles in a flowing column of liquor contained within an open based bell. The varying velocities of the liquor ensure retention of bubbles of all useful sizes, thus enabling virtually total oxygen dissolution. Both systems are useful for preventing anaerobicity in activated sludge systems and thus avoiding sludge death and subsequent sludge bulking. (Kreager-FIRL)

NEW ACTON GRANGE WORKS.
Effluent and Water Treatment Journal, Vol. 16, No. 5, p 248-250, May, 1976. 1 fig.

Descriptors: *Sewage treatment, *Treatment facilities, *Activated sludge, *Biological treatment, Aeration, Sludge treatment, Weirs, Retention, Flow control.
Identifiers: *United Kingdom.

A new sewage treatment facility in the United Kingdom is described. The new facility is an activated sludge type and is designed to produce a final effluent meeting the Royal Commission Standard. The facility will serve both existing and proposed needs within the parishes of Appleton, Grappenhall and Thelwall, Stockton Heath, Stretton, Halton, and Walton. The preliminary treatment consists of the use of curved bar screens; solids deposited on the screens pass through a disintegrator and return to the flow and then go to detritors that automatically remove any grit. Any flows which are greater than three times that of the normal anticipated dry weather flow pass over an overflow weir into storm water balancing tanks for retention and subsequent treatment. The remaining sewage flows to primary settling tanks, aeration tanks, and final settling tanks before biological treatment. Sludge from the primary tanks is pumped into sludge holding tanks for up to 28 days retention. (Kreager-FIRL)

SAN DIEGO: CIVIL ENGINEERING INNOVATIONS ABOUND.
Civil Engineering-ASCE, Vol 46, No. 2, p 68-73, February, 1976. 1 fig, 1 tab.

Descriptors: *Sewage treatment, *Treatment facilities, *Municipal wastes, *Pacific Ocean, Tertiary treatment, Water pollution effects, California, Cities, Water reuse, Recycling, Planning, Aquiculture, Heavy metals, Viruses.
Identifiers: *San Diego(Calif).

Plans for upgrading municipal sewage treatment in San Diego are discussed. Presently, San Diego's municipal sewage receives only primary treatment, with discharge being to the Pacific Ocean through a 2-mile outfall sewer. Current plans call for sticking with primary treatment but increasing the plant capacity to provide full primary treatment of the higher-than-design flows now being treated. The usefulness of upgrading to secondary treatment is questionable since 12 years of monitoring data indicate that the impact of treatment plant discharges on ocean life is not acute. Eventually, the city plans to upgrade to tertiary treatment and recycle the tertiary effluent. Uncertainties concerning the effect of heavy metals and viruses on people, however, call for a cautious approach in terms of recycling treated water back to the water supply system. Consideration is also being given to the possible practice of aquaculture around sewage outfalls. (Kreager-FIRL)

RECENT ADVANCES IN SLUDGE TREATMENT AND DISPOSAL,
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
W. H. Schroeder, and D. B. Cohen.
Water and Pollution Control, Vol. 114, No. 7, p 15-21, 24-25, 27, 38-39, July, 1976. 10 fig, 3 tab.

Descriptors: *Sludge treatment, *Sludge disposal, *Reclamation, *Byproducts, Waste disposal, Biochemical oxygen demand, Suspended solids, Biological treatment, Waste storage, Waste treatment, Dewatering, Drying, Fertilizers, *Reviews.
Identifiers: Literature reviews.

Advances in sludge treatment and disposal are reviewed. Topics discussed include: sludge stabilization, conditioning, dewatering, drying, and reduction; the use of treated sludge as a fertilizer and soil improvement agent; land reclamation uses; landfill disposal; energy and resource recovery processes; ocean disposal; and underground storage and disposal of sludge. Anaerobic digestion is receiving renewed interest because of the potential benefits of methane production, new design alternatives based on kinetic models, and the present emphasis on land application of digested sludge. However, anaerobically digested mixtures often produce supernatant recycle which is high in biochemical oxygen demand and suspended solids. A recent advance in anaerobic digestion involves thermophilic operation of the digesters as compared to operation in the mesophilic range. (Kreager-FIRL)

IS NUTRIENT REMOVAL WORTHWHILE,
Iowa State Univ., Ames. Dept. of Animal Ecology.
R. W. Bachmann, and J. R. Jones.
Water and Wastes Engineering, Vol. 13, No. 2, p 14-16, February, 1976. 2 fig.

Descriptors: *Waste water treatment, *Nutrient removal, *Phosphorus, *Lakes, *Evaluation, Mathematical models, Surface water, Water quality control, Eutrophication.

An objective basis for evaluating the potential benefits of removing nutrients from waste water to prevent eutrophication of surface waters is presented. The initial step in the process is to determine whether nutrient removal will exert a significant effect on the receiving bodies of water. A semi-empirical equation for determining the concentration of phosphorus in natural lakes is presented to illustrate that the phosphorus concentration is directly proportional to the annual inputs and inversely proportional to the depth of the lake. The magnitude of the reduction in phosphorus load to a given body of water from a nutrien removal program ultimately depends on the rela tive amounts of phosphorus being contributed t the lake from other sources such as surface runof and rainfall. A study of 34 streams in Iowa i presented to illustrate that in this case few benefit from nutrient removal at waste water facilities ar likely to result because of the relatively heav loadings from nonpoint sources. POWDERED ACTIVATED CARBON I PROVES ANAEROBIC DIGESTION,
Norristown Sewage Treatment Plant, Pa.
M. Hunsicker, and T. Almeida.
Water and Sewage Works, Vol 123, No 7, p 62-6 July, 1976. 1 fig.

Descriptors: *Activated carbon, *Sewage trea ment, *Digestion tanks, *Treatment facilitie Odor, Costs, Performance, On-site tests, Evalu tion, Digestion, Sludge, *Anaerobic digestion.

The use of powdered activated carbon to impro anaerobic digestion at a sewage treatment plant described. Starting with an initial slug of 18 pounds of activated carbon to each prima digester, followed by a dose of 350 pounds/d thereafter, improved supernatant quality and i creased gas production were observed a mon after application. Prior to carbon use, relative poor supernatant clarity limited the amount of r sludge that could be added to the digesters about 33,000 gallons/day. After carbon additi twice this volume was drawn while still returning cleaner supernatant to the pre-aeration chambe Plant odors are also reduced. Secondary efflue quality is more uniform than it is prior to carb addition and is meeting all applicable standard The cost incurred in purchasing the activated c bon has been far offset by savings resulting fro the elimination of deodorant chemicals at t plant. FUNCTIONAL DESIGN OF SANITAR SEWERS,
Pakistan Univ. of Engineering and Technolog Lahore. Inst. of Public Health Engineering a Research.
K. M. Yao.

Journal Water Pollution Control Federation, Vol 48, No 7, p 1772-1778, July, 1976. 5 fig, 5 ref.

Descriptors: *Sewers, *Design criteria, *Hydraulics, Chemical reactions, *Self purification, Hydraulic structure, Sanitary engineering, Engineering structures, Conveyance structures, Roughness coefficient, Hydrogen sulfide.

Criteria for the design of sanitary sewers are reviewed. The functional design of sanitary sewers involves the consideration of three items: hydraulics, self-cleaning action, and biochemical reactions. In current practice, it is assumed that self-cleaning of sanitary sewers is obtained by maintaining a minimum velocity of flow regardless of sewer size. However, a more rational approach may be to use the critical shear stress as the basis for the design of self-cleaning sewers since the basic mechanism of self-cleaning action is the hydrodynamic shear exerted on the sewer boundary by the flowing waste water. The design requirements of the critical shear stress approach for self-cleaning action tend to follow a pattern similar to those for hydrogen sulfide control. In both cases, the required minimum velocity increases with sewer size. For sewers with a Manning's roughness coefficient of 0.013 or less, a design critical shear stress in the range of 0.03-0.04 lb/sq ft will probably keep self-cleaning sanitary sewer systems free of hydrogen sulfide problems. For sewers with a Manning's roughness coefficient of 0.015 or greater, a design critical shear stress of 0.04 lb/sq ft seems preferable to achieve the same effects. These conclusions are valid at least within the size range up to about 60 in. (Kreager-FIRL)

SEWERING THE CITY OF NEW YORK,
New York City Environmental Protection Administration.
M. Lang, C. Samowitz, M. Jethwani, and F. Novotny.
Civil Engineering-ASCE, Vol 46, No 1, p 54-57, January, 1976. 2 fig, 1 tab.

Descriptors: *Sewers, *Sewerage, *Hydraulic structures, *Costs, *Programs, New York, Conveyance structures, Economics.
Identifiers: *New York City.

Efforts to update New York City's sewage collection system are reviewed along with current financial constraints hindering further development. Between the years 1967 and 1972, a crash program to improve the sewer system resulted in increasing the sewer output to $60 million/year. An accelerated sewer construction program was conceived in 1972, comprising $1.5 billion over the next 10 years. The key concept of the program was to proceed on entire drainage areas rather than on the piecemeal production of individual laterals to appease complaints on a given block. Recent financial difficulties, however, have at least temporarily stalled the program, with only about $10 million in funding going for sewer repairs. A breakdown of the city's sewerage needs is tabulated by individual boroughs. (Kreager-FIRL)
W77-00070

MAINE SEWER BID 39% BELOW ESTIMATE.
Engineering News-Record, Vol. 197, No. 7, p 45, August 12, 1976.

Descriptors: *Interceptor sewers, *Construction, *Hydraulic structures, *Pipelines, *Materials, Conveyance structures, Costs, Maine, Sewage, Municipal wastes.
Identifiers: *Portland(Me).

The construction of a proposed interceptor sewer for the city of Portland, Maine is discussed. The new interceptor will replace an existing brick sewer that discharges raw sewage into the Fore River and into Casco Bay. Work on the project includes the installation of about 5500 ft of 48-inch diameter reinforced concrete interceptor pipe along Portland's Commercial Street which runs adjacent to the river and bay. The pipeline will be installed in open trenches. Additionally, a 4500-foot long and 36-inch in diameter prestressed concrete force main will be constructed to carry the sewage from the interceptor to a new treatment plant. Overflow and diversion structures also will be built. About 400 ft of the new pipeline will be encased in concrete in areas where the interceptor will run under a series of railroad crossings. The lowest bidder for construction of the project dropped 39% below the consulting engineer's $3.9 million estimate. (Kreager-FIRL)

PLANNING AND CONSTRUCTION OF BIRMINGHAM'S MAIN OUTFALL SEWER,
Metropolitan Borough of Wolverhampton (England). Dept. of Technical Services.
M. V. King.
Chartered Municipal Engineer, Vol. 103, p 87-95, June, 1976. 5 fig, 4 tab, 2 ref.

Descriptors: *Sewers, *Waste water treatment, *Urban drainage, *Urban hydrology, Hydraulic structures, Conveyance structures, Costs, *Construction, *Design criteria.
Identifiers: *Birmingham(Gt. Brit).

The design and construction of a main outfall sewer for the city of Birmingham (Great Britain) is described. Design is based on conditions which will prevail after major redevelopment is completed in the area and accommodates a 5-year storm in the foul water system. Design involving the storm water system is for a 2-year interval storm. The setting of overflows is based on frequency of operation, with storm flows being evaluated for frequent storms. The route of the main outfall is designed to collect together as many sewers as possible for routing to the Minworth Sewage Works. The most difficult single problem encountered in the project involved connection to the Minworth carrier. Detailed maps of the city illustrate the location of the main outfall sewer, overflow, the Minworth carrier, and drainage patterns. Cost estimates for the construction of the drainage system are also presented. (Kreager-FIRL)

A RETROSPECTIVE ON THE STRUCTURAL STABILITY OF RCC SPUN SEWER PIPES,
National Water Authority of Jamaica (Kingston).
V. S. Chauhan.
Journal of the Institution of Engineers (India), Vol. 56, Pt. EN2, p 45-50, February, 1976. 6 fig, 2 tab, 6 ref.

Descriptors: *Sewers, *Pipelines, *Hydraulic structures, *Conduits, *Concrete pipes, *Structural stability, Repairing, Conveyance structures, Sanitary engineering, Materials.
Identifiers: *Reinforced cement concrete.

The structural stability of non-pressure cement concrete spun sewer pipes is discussed, with particular emphasis on determining the safe laying depth of such pipes. The supporting strength of a particular pipe classification is shown to be a function of the distribution of the vertical load, bedding conditions, and the lateral pressure which acts on the sides of the pipe. Data on the safe depth of earth cover and over-burden for various bedding conditions are tabulated according to pipe diameters ranging from 150-1800 mm. Methods for detecting and repairing structural deficiencies in spun sewer pipes are also briefly outlined. (Kreager-FIRL)
W77-00073

LARGE-DIAMETER CORRUGATED STEEL PIPE ENTERS STORM SEWER FIELD.
Water and Pollution Control, Vol. 114, No. 7, p 14-15, July, 1976.

Descriptors: *Sewers, *Steel pipes, *Storm drains, *Conduits, *Materials, Conveyance structures, Hydraulic structures, Pipes, Costs, Construction, Indiana.
Identifiers: Indianapolis(Ind).

The installation of 11-foot diameter, fully-lined corrugated steel pipe storm sewers via tunnelled construction is described as part of the Indianapolis, Indiana storm relief sewer project. The galvanized steel pipe which consists of 3 by 1 inch corrugations and spiral lockseam construction is first interior sprayed with bituminous material plus additives of asbestos and mica as a tack coating. This assures adherence of the finish coat, a centrifugally-spun liner of asphalt. Finally, asphalt is sprayed onto the pipe exterior for added corrosion resistance. Because of its comparatively light weight, the pipe can be winched into preplanned position. An 18-foot section weighs 7300 pounds as compared to 30,800 pounds for a 6-foot section of concrete pipe. Use of the 11-foot diameter steel pipe instead of 13-foot concrete pipe reduces the overall tunnel size to 13 ft, resulting in a savings of more than $100,000 in construction costs for a 1200-foot section. (Kreager-FIRL)
W77-00074

SEWER FORCE MAIN HELPS SOLVE POLLUTION PROBLEM.
Water and Sewage Works, Vol. 123 No. 7, p 48, July, 1976. 1 fig.

Descriptors: *Sewers, *Recreation facilities, *Conveyance structures, *Hydraulic structures, Construction, Materials, Pipelines, Alabama, Sewerage, Pipes, Concrete.
Identifiers: Mobile(Ala).

The use of a 48-inch prestressed sewer force main to help solve the pollution problem affecting a heavily used recreational area in Mobile, Alabama is described. The construction of the main is part of a plan to abandon an Eslava Creek treatment plant which discharges into the Dog River and pump to a McDuffie pollution control plant for effluent dispersal into the Mobile River. The force main which extends from a new Eslava Creek pumping station to the McDuffie pollution control plant includes 560 ft of 36-inch prestressed concrete pressure pipe and 26,400 ft of 48-inch prestressed pressure pipe. A blind cross at the McDuffie plant will permit future expansion of the line. A 1900-foot section of the 48-inch pipe was installed above ground on piers because of unstable soil conditions. Another section of the project called for 50 ft of tunneling under the Louisville and Nashville Railroad and 168 ft of tunneling under Interstate 10. (Kreager-FIRL)

PHYSICAL-CHEMICAL TREATMENT IMPROVES IRAN'S URBAN RUNOFF,
Tehran Univ. (Iran). Dept. of Environmental Health.
P. Samar, M. Sarai, N. Razeghi, G. Jamshidnia, and M. Hakimipour.
Water and Sewage Works, Vol. 123, No. 8, p 77-79, August, 1976. 4 fig, 2 tab, 8 ref.

Descriptors: *Urban runoff, *Waste water treatment, *Coagulation, *Adsorption, *Flocculation, *Sedimentation, Turbidity, Chemical oxygen demand, Lead, Heavy metals, Suspended solids, Separation techniques, Efficiencies, Performance, Activated carbon.
Identifiers: *Iran.

Environmental studies in Iran have revealed that a physical-chemical process consisting of coagulation, flocculation, sedimentation, and carbon adsorption is effective in treating urban land runoff. A system employing coagulation with alum, sedimentation, and adsorption with powdered activated carbon yielded average removal efficiencies of 97, 85, and 100% for turbidity, chemical oxygen demand, and lead, respectively. By comparing removal efficiencies in various stages of the treatment process, it was established that turbidity, chemical oxygen demand, and lead are mostly in the settleable and suspended solid forms. Consequently, coagulation, flocculation, and sedimentation result in high removals for these parameters. The optimum dosage of powdered activated carbon was chosen according to the adsorption efficiency of carbon for dissolved organics and averaged 58 milligrams/liter. (Kreager-FIRL)

URBAN STORMWATER DETENTION AND FLOW ATTENUATION,
H. G. Poertner.
Public Works, Vol. 107, No. 8, p 83-85, August, 1976.

Descriptors: *Urban runoff, *Storm water, *Detention reservoirs, *Cities, *Flow control, Rain, Design criteria, Recreation facilities, Surface waters.

Methods for achieving stormwater detention and flow attenuation in urban areas are discussed, with particular emphasis on detention ponds on earth surfaces, detention of rainfall on parking lots, and rainfall detention on rooftops. The following criteria for designing detention facilities are discussed: the prevention of excess stormwater buildup in habitable areas, the provision of a positive outlet for discharge of inflows when storage capacity is exceeded, the construction of sufficiet slopes for detention areas, the proper location of the deeper portions of storage areas, an evaluation of runoff that is likely to enter the storage site from upstream areas, the provision for uniform regulation of release flow rates, the planning of storage areas for more than one purpose, and the calculation of storage volume requirements. The development of storage ponds into recreational facilities is also discussed. (Kreager-FIRL)
W77-00078

AN OVERVIEW: SO YOU WANT TO RECYCLE YOUR WASTEWATER. HOW SHOULD YOU BEGIN. IS IT FEASIBLE,
G. R. Mace.
Industrial Water Engineering, Vol. 14, No. 2, p 24-26, April/May, 1976. 5 tab.

Descriptors: *Water reuse, *Waste water treatment, *Reclamation, *Industrial water, Cost-benefit analysis, Reclaimed water, Economics, Design criteria, Waste disposal, *Recycling.

A systematic approach for analyzing the economics of waste water disposal versus reuse is presented. The approach consists of four major steps: a detailed analysis of the effluent, a determination of the effect of recycle water on product quality, a survey of waste treatment operations available, and a total economic analysis. Cost data for a hypothetical problem involving the following three alternatives are presented: purchase and sewer disposal of 100% of the water, recycle of 50% and sewer disposal of 50% of the waste water, and recycle of 90% and river discharge of 10% of the waste water. The figures cited are intended only to demonstrate the results that can be derived from a well planned program of industrial plant design. (Kreager-FIRL)

DECREASE OF BACTERIAL CONTENT IN DIFFERENT TYPES OF STABILIZATION PONDS,
National Environmental Engineering Research Inst., Nagpur (India).
N. M. Parhad, and N. U. Rao.
Indian Journal of Environmental Health, Vol. 18, No. 1, p 33-46, 1976. 8 fig, 2 tab, 11 ref.

Descriptors: *Biological treatment, *Stabilization, *Ponds, *Bacteria, Coliforms, E. coli, Biochemical oxygen demand, Performance, Efficiencies, *Waste water treatment, Design criteria.
Identifiers: Enterococci.

Stabilization ponds at three different locations in Nagpur, India were studied to determine decreases in bacterial content. Samples were collected and analyzed for standard plate count, coliforms, E. coli, Enterococci, and biochemical oxygen demand. The pond showing the highest percentage reductions in both biochemical oxygen demand and indicator bacteria had a greater length of liquid travel and a higher initial organic concentration than the other two ponds. Its interconnecting arrangement which permitted surface overflow from one cell to the next, facilitating the transfer of a much larger algal population to the subsequent cell, also appeared responsible for its greater efficiency. The results of the study indicate that in addition to loading, detention period, and other design criteria such factors as the interconnecting arrangement between cells, the mode of operation, and the length of liquid travel also contribute to the bacterial removal efficiency of stabilization ponds. (Kreager-FIRL)

WASTEWATER TREATMENT BY REVERSE OSMOSIS,
Hitachi Ltd., Tokyo (Japan). Environmental Protection Systems Div.
A. Shimozato, S. Takahashi, Y. Koike, K. Ebara, and S. Komori.
Hitachi Review, Vol. 25, No. 4, p 147-152, 1976. 6 fig, 5 tab, 1 ref.

Descriptors: *Reverse osmosis, *Scaling, *Waste water treatment, *Water reuse, *Reclaimed water, Reclamation, Industrial wastes, Symbiosis, Membranes, Automation, Design criteria, Recycling, Cleaning, Evaporation, Electrodialysis.

Experiments dealing with membrane scale prevention during waste water treatment with reverse osmosis are reported. An automatic continuous ball cleaning system was developed which permits membrane cleaning during operation. The ball cleaning method involves passing sponge balls through the system for impact with the membrane and for promoting turbulent flow. Although adequate for the prevention of soft scale, it was found necessary to combine ball cleaning with chemical treatment for the prevention of hard scale. A combined chemical and ball cleaning system was operated continuously for 1500 hours and demonstrated both effectiveness and reliability. The application of reverse osmosis to closed system waste water treatment is illustrated for the electronics industry. The use of electrodialysis and evaporation in closed system treatment is also discussed. (Kreager-FIRL)
W77-00081

POLYMERS PLAY INCREASED ROLE IN WATER CLARIFICATION,
Calgon Corp., Pittsburgh, Pa.
J. J. Morrow.
Water and Sewage Works, Vol. 123, No. 7, p 78-81, July, 1976. 5 fig, 2 tab.

Descriptors: *Polymers, *Separation techniques, *Waste water treatment, *Coagulation, *Filtration, Ions, Municipal wastes, Industrial wastes, Performance, Economics, Suspended solids.
Identifiers: Synthetic organic polymers.

The use of synthetic organic polymers in operations involving solids/liquid separation is discussed. The applications of synthetic organic polymers range from the treatment of surface waters to the removal of suspended solids from the final clarifiers of municipal and industrial waste treatment plants. These polymers have also become instrumental in the development of new treatment applications such as direct filtration and high energy mixing. The high performance of synthetic organic polymers is attributed to their high molecular weights and the variety of electrically charged groups that can be placed along the polymer chain. Cationic polymers, for example, can be used in place of alum and lime for primary coagulation, with the result being a significant reduction in the volume and cost of treatment chemicals. Direct filtration with polymers is a treatment method being employed by an increasing number of municipal water systems. The polymers are applied as primary coagulant directly to the raw water source; after rapid mixing, the water is filtered without the benefits of flocculation and sedimentation. (Kreager-FIRL)

WASTEWATER OZONATION: A PROCESS WHOSE TIME HAS COME,
Union Carbide Corp., Tonawanda, N. Y.
H. M. Rosen.
Civil Engineering - ASCE, Vol. 46, No. 3, March 1976, p. 65-69. 4 fig, 1 tab.

Descriptors: *Waste water treatment, *Water quality, *Ozone, *Chlorine, *Effluents, *Chlorinated organic compounds, Legislation, Toxicity, Phenols, Oxidation.
Identifiers: Cyanide, Hypochlorides, Once through oxygen method, Oxygen recycle method, Once-through air method, *Ozonation.

Since 1903 ozone (O3) has been used as a polishing agent and disinfectant for potable water, but only recently has ozone been proposed for use as a cost effective way to achieve waste standards. Recently expanding interest is due to higher degree of treatment required by new pollution control laws, awareness of toxicity of chlorine (Cl), the Cl shortage in 1974, the trend toward reuse of treated waste water, technological advances in O3 research, understanding of O3 as a strong disinfectant and oxidant creating no secondary pollution problems, and the installation of oxygen activated sludge secondary treatment systems. O3 has a short half life, reverting quickly back to oxygen leaving nothing but dissolved oxygen in the treated waste water. Cl is toxic to aquatic life; forms chlorinated organic compounds at ppb concentrations which are not removed by traditional dechlorination practices. These non-biodegradable chlorinated organic compounds accumulate in the environment and in aquatic species. O3 may be

ore cost effective than Cl if there is concern for
hlorinated products in effluent, effluent toxicity,
r if the use of hypochlorites is required for safety.
ide benefits of O3 use include increased virus
emoval, reduced effluent color and/or turbidity,
dor and taste control, and effective removal of
henols and cyanides. There are 3 major O3 disin-
ectant processes. First, the once-through oxygen
ethod where dry oxygen is fed to the O3 genera-
r, the waste water disinfected and off-gas used
feed an oxygen activated sludge process after
estruction of unreacted O3. Second, the oxygen
ecycle method where off-gas is cleaned and dried
nd returned to the O3 generator. Thirdly, the
nce-through air method used when an oxygen ac-
vated sludge system is not in operation. (Gentry-
lorth Carolina)

THE USE OF STOCHASTIC MODELS IN THE INTERPRETATION OF HISTORICAL DATA FROM SEWAGE TREATMENT PLANTS,
Wisconsin Univ., Madison.
P. M. Berthouex, W. G. Hunter, L. Pallesen, and C. Y. Shih.
Water Research, Vol. 10, No. 8, p 689-698, 1976. 6 fig, 5 tab, 3 ref.

Descriptors: *Sewage treatment, *Treatment facilities, *Methodology, *Time series analysis, Regression analysis, Efficiencies, Effluents, Biochemical oxygen demand, Mathematical models, Systems analysis, Stochastic processes, Suspended solids, Data collection, *Water pollution control.
Identifiers: Autoregressive models, Historical data.

Careful collection and examination of field data are essential if the dynamic performance of sewage treatment plants is to be understood. A 3-year historical record of sewage treatment plant performance has been evaluated graphically and with time series methodology. Models relating influent biochemical oxygen demand to effluent biochemical oxygen demand, mixed liquor suspended solids, temperature, an hydraulic detention time were constructed. Four possible definitions of plant efficiency were defined and studied as well. The use of efficiency rather than effluent BOD for modeling performance was not helpful. A logarithmic transformation of BOD seems to be a better metric than BOD itself. Studying historical records should lead to an improved understanding of plant dynamics. Time series methods seem to be one useful tool for this work. (Bell-Cornell)

EVALUATION OF PROPOSED MAN-MADE PONDS FOR FOOD PRODUCTION TO RECOVER VALUES IN WASTE HEAT AND SOLID ORGANIC SLUDGES,
Massachusetts Univ., Amherst. Water Resources Research Center.
J. W. Zahradnik, L. S. Turner, H. G. Levine, and C. Tucker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 773, Price codes: A04 in paper copy, A01 in microfiche. WRRC Publication No. 65, Completion Report FY-76-12, March 1976. 58 p, 14 fig, 3 tab, 22 ref, 4 append. OWRT A-079-MASS(1).

Descriptors: Aquaculture, Organic wastes, Feasibility studies, Effluents, Economic feasibility, Risks, Thermal pollution, *Nutrient requirements, *Sewage sludge, Public health, Ponds, *Waste water treatment.
Identifiers: *Thermal waste, Waste heat, Wastes recovery.

An analysis was conducted to determine: (1) the potential value of using, simultaneously, thermal effluents and sewage sludges in aquatic cultures; (2) the technical and economic feasibility of utilizing multilevel aquatic cultures in the recovery of these wastes; and (3) data voids and uncertainties which are of importance in implementation of the system designed. System inputs, potential system outputs and potential subsystem characteristics were characterized and documented through a literature survey. The alternative solutions were generated and evaluated on the basis of a matrix. Within the systems examined there appears a greater potential to utilize sludge than thermal discharges since a small fraction of the thermal effluents could be accommodated. Economic feasibility was not established. The data voids and uncertainties include the following: (1) kinetics of nutrient availability from sludge in aqueous media; (2) reliability of the subsystems in terms of disease control and invasion of undesirable species; (3) reconciliation of drastically different residence times between nutrient laden waters and thermally useful waters as they flow through subsystems; (4) evaluation of the consumable materials from public health and nuisance perspectives; and (5) effects of the subsystem on groundwater.

EVALUATION OF ACTIVATED SLUDGE CONTROL TECHNIQUES THROUGH PILOT PLANT AND COMPUTER ANALYSES,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
R. E. Roper, Jr., and C. P. Leslie Grady, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 774, Price codes: A10 in paper copy, A01 in microfiche. Technical Report No. 77, June 1976. 192 p, 71 fig, 45 tab, 63 ref, 5 append. OWRT A-033-IND(1).

Descriptors: *Activated sludge, Biodegradation, Organic loading, Pilot plants, Control, *Waste water treatment, *Oxidation, Treatment facilities, Sludge treatment.
Identifiers: *Cell residence time, *Hydraulic control formula, Sludge age, Bio-oxidation, Sludge thickening.

An approach to activated sludge systems control was developed and experimentally verified in which the key parameter is the sludge age or mean cell residence time. Central to this approach is the use of a hydraulic control formula which can be applied to a wide variety of control situations and can be made plant specific by a simple calibration technique. To supplement the control formula a system descriptive operational diagram was developed which superimposes the predictions from current models for activated sludge bio-oxidation, sludge thickening and oxygen transfer. The diagram allows the operator to visualize the system constraints so that the need for a control action is obvious. The efficacy of the hydraulic control formula was evaluated through the use of two 850 gal/day activated sludge pilot plants. Analysis of the batch settling data indicated good promise for use in describing the sludge thickening constraints imposed on the system by the final settler.

TERTIARY TREATMENT AND REUSE OF ANIMAL WASTES,
Delaware Univ., Newark. Dept. of Agricultural Engineering.
W. F. Ritter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 768, Price codes: A03 in paper copy, A01 in microfiche. Completion Report (1976). 36 p, 1 fig, 17 tab, 20 ref. OWRT A-030-DEL(1), 14-31-0001-5008.

Descriptors: *Farm wastes, Nitrogen, Phosphorus, Chemical oxygen demand, Denitrification, *Tertiary treatment, *Waste water treatment, Water reuse, Recycling, Waste disposal.

Two barriered landscape water renovation systems (BLWRS) were operated for nearly two years. The first BLWRS (BLWRS-1) was constructed from a silt loam soil and the second (BLWRS-2) was constructed from a sandy loam soil. Liquid dairy waste was applied to BLWRS-1 at a loading rate of 0.84 cm/day and to BLWRS-2 at loading rates of 0.84-2.45 cm/day. The high loading rate of 2.45 cm/day was only maintained for 47 days because of ponding on the BLWRS surface. The average COD removal rate was 95% for BLWRS-1 and 98% for BLWRS-2, while the nitrogen removal for BLWRS-1 and BLWRS-2 was 87 and 91%, respectively. Both BLWRS removed over 99% of the phosphorus. The treatment efficiency did not change with loading rate or there was no significant change in effluent quality during the different seasons of the year. Besides removing COD, nitrogen, and phosphorus, the BLWRS will remove significant amounts of potassium, sodium, aluminum and zinc from liquid dairy manure. The results also indicate that a BLWRS cannot be operated for the entire winter in the Mid Atlantic States. The estimated annual cost for a waste handling system for a 100 free-stall dairy herd using recycled effluent in a flushing system with a lagoon and BLWRS would be $7717. The waste handling system using a BLWRS was estimated to be more expensive than four other systems. The BLWRS might have more potential as a tertiary treatment method for motels and campgrounds than for a dairy farm. The greatest potential for using a BLWRS in the livestock industry would probably be with milking center wastes.

BIOLOGICAL PURIFICATION OF THE IZMAIL BOARD MILL EFFLUENTS (BIOLOGICHESKAYA OCHISTKA STOCHNYKH VOD IZMAIL'SKOGO TSELLYULOZNO-KARTONNOGO KOMBINATA),
E. Kh. Gerts.
Biokhimicheskaya Ochistka Stochnykh Vod, Materialy Respublikanskoi Konferentsii, Vol. 1, p 18-19, 1972, Published 1976.

Descriptors: *Pulp wastes, *Waste water treatment, *Biological treatment, Wastes, *Industrial wastes, Waste treatment, Water pollution sources, Pulp and paper industry, Biochemical oxygen demand, Hydrogen ion concentration, Municipal wastes, Canneries, Suspended solids, Foreign countries, Water pollution treatment, Treatment facilities.
Identifiers: Kraft mills, *USSR.

The overall effluent from the Izmail mill which manufactures kraft pulp has a COD (permanganate) of 271.6-354.2 mg/liter or (dichromate) 939-1280 mg/liter, a 5-day BOD of 177.8-226.6 mg/liter, and a pH of 7.2-10.5. Biochemical purification equipment of 20,000 cu m/day capacity, installed in 1965, reduced the COD by 33-61% and the BOD by 63-78.8%. In 1968 the capacity of the equipment was increased to 41,100 cu m/day, and the joint purification of the mill effluents, municipal sewage, and effluents from a canning plant was introduced. Because of the composition of the municipal and canning wastes, the effectiveness of purification was increased to 57.4-62.6% for COD and to 92.6-93.0% for BOD. There was also a nearly 94% reduction of suspended solids. (Stapinski-IPC)

DIMINUTION OF SUSPENDED SOLIDS IN PULP AND PAPER INDUSTRY EFFLUENTS BY TREATMENT WITH CHEMICAL COAGULANTS (DIMINUAREA CONTINUTULUI DE SUSPENSII TOTALE IN APELE REZIDUALE DIN INDUSTRIA CELULOZEI SI HIRTIEI, PRIN TRATAREA CU AGENTI CHIMICI COAGULANTI),
E. Strugariu.
Celuloza si Hirtie, Vol. 25, No. 1, p 27-34, January/March, 1976. 10 fig, 3 tab, 10 ref.

Descriptors: *Pulp wastes, *Suspended solids, *Waste water treatment, *Coagulation, Wastes, *Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Water pollution control, Lime, Silica, Bentonite, Clays, Flocculation, Water purification, Chemical precipitation.
Identifiers: Aluminum sulfate, Sodium aluminate, Iron sulfate, Sodium silicate, Carboxymethylcellulose, Polyamine-polyamide-epichlorohydrin condensates, Polyacrylamide.

After a review of the mechanism of action of coagulants, laboratory experiments are reported on the removal of suspended solids from kraft pulp and paper mill effluents by treatment with several coagulants (with or without addition of flocculating aids). Chemicals added to the waste water included aluminum sulfate, lime, sodium aluminate, ferrous sulfate, activated silica, sodium silicate, sodium carboxymethylcellulose, polyamine-polyamide- epichlorohydrin condensate, hydrolyzed polyacrylamide, and bentonite. Only four of these gave good results, namely, sodium aluminate, lime, aluminum sulfate, and activated silica. In optimum doses of 700, 400, 200, and 30 mg/liter, respectively, they achieved a suspended solids reduction to less than 100 mg/liter. Adding lime or bentonite as flocculant aids did not stimulate the coagulating effect of aluminum sulfate. (Brown-IPC)
W77-00323

HYDROLYSIS OF PRESS WASTE WATERS FROM THE MANUFACTURE OF FIBER (INSULATION) BOARDS (CONTRIBUTII LA STUDIUL PROCESULUI DE HIDROLIZA A APELOR DE PRESA DIN CIRCUITUL DE FABRICATIE AL P.F.L.),
R. Butnaru, M. Sirbu, and S. Petrovan.
Celuloza si Hirti, Vol. 25, No. 1, p 11-17, January/March, 1976. 14 fig, 3 tab, 3 ref.

Descriptors: *Waste water treatment, *Hydrolysis, *Carbohydrates, Wastes, Waste treatment, Water pollution sources, Water pollution treatment, *Wood wastes, Temperature, Hydrogen ion concentration, Acidity, Corrosion, Chemical degradation, Water pollution control, Waste dilution.
Identifiers: *Insulation boards, Wood particle boards, Sugars, Wood, Defibration.

Waste waters from the defibration of wood (or wood wastes) and the platen pressing of wood-fiber or wood-particle boards contain about 20-30 g/liter of carbohydrates. The effects of hydrolysis parameters on sugar yield were investigated. Reaction time and temperature were found to have a more pronounced effect than did pH and dilution ratio. Maximum sugar yield was obtained after about 2 hr (118 min), minimum yield at 115C; above this temperature, the yield increased. The greatest yield increase was observed between pH 0.5 and 1.0, but since this acidity poses corrosion problems, it is recommended to conduct commercial hydrolyses at pH 1.5-1.75. (Brown-IPC)

Identifiers: USSR.

The 5-day BOD of wood-hydrolysis and fermentation plant effluents is 1200-1500 mg/liter, depending on their dilution, and their pH is 5-5.5. The effluents are purified by neutralization with lime, separation of sand and other heavy particles, removal of suspended solids by sedimentation, and biochemical oxidation in aeration tanks. In this article, a description is given of the purification equipment at the Ivdel' fermentation plant (U.S.S.R.) and the control of its operation, which consists in daily determinations of 5-day BOD, permanganate oxidizability, suspended solids, and reducing substances, and additional determinations, each month, of temperature and nitrogen and phosphorus contents of the effluents. Because of its insufficient capacity, the equipment will be modernized to achieve a 5-day BOD after purification of 19 mg/liter. (Stapinski-IPC)

WASTE WATER TREATMENT AT SCP (SEMICHEMICAL PULP), CGP (CHEMIGROUNDWOOD PULP) MILLS,
Daishowa Paper Mfg. Co., Ltd., Fuji (Japan).
I. Ogiya.
Japan Pulp and Paper, Vol. 13, No. 4, p 45-52, December, 1975. 8 fig, 11 tab.

Descriptors: *Pulp wastes, *Waste water treatment, Foreign countries, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Oxidation, *Chemical oxygen demand, Water pollution control, Coagulation, Sedimentation, Activated sludge.
Identifiers: *Japan, Chemical recovery, Aluminum sulfate, *Semichemical pulp mills, Chemigroundwood mills.

Effluent treatment at semichemical pulp mills is discussed with emphasis on COD reduction. The following chemical recovery processes used at Japanese semichemical pulp mills are briefly described, including the ESI direct oxidation method (developed jointly by Ebara Manufacturing Co. Ltd. and Saga Paperboard Co.), the SCA-Billerud process (developed by Svenska Cellulosa AB. jointly with Billerud AB. of Sweden), Tampella process (Tampella AB./Oy. of Finland) and the RAS (recovery process by air oxidation of sodium sulfide) process developed by Mitsubishi Heavy Industries Ltd. of Japan. Flow diagrams are given for each process, and the important chemical reactions in each are discussed. Treatment of the waste water after chemical recovery to further reduce COD is discussed. Experimental data show that coagulation-sedimentation with alum reduces the COD by 36-38%, while activated sludge treatment reduces COD by about 30%. With electrolytic coagulation, COD reduction is approximately 60%. Electrolytic coagulation followed by activated sludge treatment reduced COD by 80%. (Witt-IPC)

BLEACHABILITY OF SOFTWOOD AND HARDWOOD KRAFT PULPS IN OZONE BLEACHING (IN JAPANESE),
Government Industrial Research Inst., Takamatsu (Japan).
H. Kamishima, T. Fujii, and I. Akamatsu.
Japan Tappi, Vol. 30, No. 7, p 381-391, July, 1976. 13 fig, 6 tab, 12 ref.

Descriptors: *Bleaching wastes, *Ozone, *Waste water treatment, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Chemical oxygen demand, Biochemical oxygen demand, Activated sludge, *Pulp wastes, Pine trees, Deciduous trees, Coniferous trees, Chlorine, Effluents.
Identifiers: Beech trees(Fagus), Kraft mills.

Pine and beech kraft pulps of comparable unbleached brightness were treated with ozone. The ozone bleaching waste waters (from pulps above 72% brightness) contained a COD(Mn) pollution load of 30-50 g/kg of pulp; the BOD/COD(Mn) ratio was 0.6-0.8, with higher values for beech- than pine-derived effluent. Acuvated sludge treatment of the ozone bleaching wastes achieved a higher COD reduction than for spent alkaline ex-

raction wastes from chlorine bleach plants; the COD reduction was greater for beech- than for pine-derived effluents. (Brown-IPC)

COLOR REMOVAL FROM SOFTWOOD KRAFT CAUSTIC EXTRACT EFFLUENT BY POLYAMINES,
Institute of Paper Chemistry, Appleton, Wis.
T. C. Kisla.
Ph.D. Thesis, 1976, 110 p. 28 fig, 48 ref, 20 tab.

Descriptors: *Bleaching wastes, *Color, *Waste water treatment, *Chemical precipitation, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Effluents, Softwood, Water pollution control, Pulp wastes, Pulp and paper industry.
Identifiers: *Polyamines, *Amines, Polyethylenimine, Ethylenediamine, 1,12-Diaminododecane, Kraft mills, Diethylenetetramine, Triethylenetetramine.

Polyamines were evaluated for their ability to remove color from the alkaline extraction effluent of a kraft mill bleach plant, and from a reconstituted acid-insoluble fraction of the effluent. Polyethylenimine 18 (having a molecular weight of 1800) removed 85-90% of the color from the effluent in the pH range 7-8.5. Linear polyamines (e.g., di- and triethylenetetramine, ethylenediamine) were less effective for color removal, but they were most effective in acidic conditions. Ethylenediamine and 1,12-diaminododecane removed some color from the effluent, but the other diamines tested did not. A general mechanism of color removal by polyamines is proposed. (Buchanan-IPC)

Przeglad Wlokienniczy Vol. 30, No. 4, p 217-220, April, 1976. 3 fig, 4 tab, 5 ref.

Descriptors: *Textiles, *Waste water treatment, *Activated carbon, *Sorption, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution control, Odor, Hydrogen ion concentration, Color, Turbidity, Foaming, Chlorides, Sulfates, Iron, Manganese, Organic compounds, Oil, Lipids, Water purification, Economics, Water pollution sources, Cotton, Fabrics, Filters, Sands, Coagulation, Oxidation, Recycling, Water reuse.
Identifiers: Synthetic fabrics, Regenerated cellulose.

Effluents from the production of cotton and cotton-synthetic and -regenerated fiber fabrics purified by coagulation, and effluents from the production of regenerated cellulose and synthetic fiber fabrics purified on sand filters, were subjected to additional purification by sorption on granulated activated carbon in a three-column reactor. The effectiveness of the purification was evaluated by determinations of odor, pH, color, turbidity, oxidizability, foam formation, and the contents of chlorides, sulfates, iron, manganese, and organic substances (fats and oils). The results indicate that this method of additional purification is not only effective in removing impurities but also presents the possibility of achieving a closed cycle of process water. The flexibility of the sorption process makes it possible to control the degree of purification desired. However, this method is economically justified only when applied to effluents that have been purified chemically or biologically or to effluents with a low concentration of impurities, such as wash waters. Research Disclosure, No. 142, p 46, February, 1976. 1 fig.

Descriptors: *Reverse osmosis, *Waste water treatment, *Water reuse, Wastes, Industrial wastes, Water pollution treatment, Waste treatment, Water pollution control, Separation techniques, Membrane processes, Fibers(Plant), Filtration, Water conservation, Industrial water, *Patents, Recycling.
Identifiers: *White water(Paper machines).

A reverse osmosis system is described for concentrating white water from a paper machine, the white water having been previously freed of its fiber content through treatment in a filter or decanter. The reverse osmosis unit separates the fiber-free white water into a concentrate of pulp additives (e.g., wet- and dry-strength agents) and a permeate (a form of deionized water). Both the concentrate and the permeate can be recycled in the papermaking process, making it possible to operate the mill on a closed-water system basis. (Speckhard-IPC)
W77-00340

SECONDARY DEGRADATION OF SULFITE MILL WASTE WATER BY DEVELOPMENT OF ALGAL MASSES (SEKUNDAERABBAU VON SULFITZELLSTOFFABWASSER DURCH ALGEN-MASSENENTWICKLUNGEN),
G. Otto.
Zellstoff und Papier, Vol. 25, No. 6, p 170-173, June, 1976. 3 fig, 1 tab, 8 ref.

Descriptors: *Pulp wastes, *Sulfite liquors, *Algae, *Waste water treatment, *Lignins, *Degradation(Decomposition), Oxidation, Color, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Water pollution treatment, Effluents, Aquatic algae, Biodegradation.
Identifiers: Lignosulfonic acids.

The oxidation processes during the secondary degradation of biochemically pretreated sulfite pulp mill effluents are considerably accelerated in the presence of unicellular green algae. Color elimination of about 98% occurs in 100 days. This effect is attributed primarily to the oxidation of lignosulfonic acids by nascent oxygen arising from algal photosynthetic activity. (Ward-IPC)
W77-00341

PROCESS FOR PURIFYING INDUSTRIAL WASTE WATERS (PROCEDE D'EPURATION D'EAUX USEES INDUSTRIELLES).
CIBA-GEIGY Ltd., Basel (Switzerland).
French Patent No. 2,189,327. January 25, 1974, 18 p, 7 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp wastes, *Textiles, *Dyes, *Patents, *Flocculation, Wastes, Water pollution sources, Waste treatment, Water purification, Anions, Ureas, Water pollution treatment, Water pollution control, Color, Flocculation, Chemical precipitation.
Identifiers: *Leather, Formaldehyde, Optical brighteners, Dicyandiamide.

A process for decoloring waste waters coming from the textile, paper, or leather industries or from the manufacture of water-soluble anionic dyes or optical (fluorescent) brighteners is characterized by the addition of a water-soluble condensation product of formaldehyde (e.g., with dicyandiamide or urea) and elimination of the resulting flocculated material. (Speckhard-IPC)

PROCESS FOR TREATING WASTE WATER (VERFAHREN ZUR BEHANDLUNG VON ABWASSER),
SCA Development A.B. (Sweden).
A. H. Karlsson.
German Patent (Offenlegungsschrift) No. 2,521,893. November 20, 1975, 8 p, 1 tab.

Descriptors: *Bleaching wastes, *Waste water treatment, *Oxidation, *Patents, Pulp wastes, Neutralization, Organic compounds, Metals, Iron, Iron compounds, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Waste treatment, Oxidation-reduction potential.
Identifiers: Hydrogen peroxide, Iron sulfate.

An oxidation process for partially or completely neutralizing organic materials in the effluent from a pulp mill (especially bleaching effluent) involves at least partial oxidation of the materials with hydrogen peroxide in the presence of a metal which can occur in at least two oxidation stages (e.g., iron), the metal being added in its lowest oxidation state (e.g., as ferrous sulfate). (Speckhard-IPC)

SANITARY-BACTERIOLOGICAL EVALUATION OF THE METHOD OF TREATMENT AT A SMALL SEWAGE PLANT, (IN RUSSIAN),
B. G. Vodop'Yan, Y. P. Zhil'Tsov, S. P. Shchennikov, and T. F. Kuznetsova.
Gig Sanit 4, p 95-97, 1975.

Descriptors: *Sewage treatment, *Waste water treatment, *Aeration, *Oxidation lagoons, Settling basins, Filters, Filtration, Chlorination, Pathogenic bacteria, Activated sludge, Microorganisms.
Identifiers: Salmonella-typhimurium, Sand filters, Sand filtration.

Sewage treated in aeration tanks and settling basins required additional treatment in sand filters, filter beds and biological oxidation ponds. Sand filtration and subsequent chlorination eliminates the entry of pathogenic microorganisms (e.g., Salmonella typhimurium) into a water body. Treatment of excess activated sludge in aerobic stabilizers is highly effective in a bacteriological respect and is recommended for wide use.--Copyright 1976, Biological Abstracts, Inc.

BASF COMPLETES TEN-YEAR PROJECT FOR CLEANING UP THE RHINE,
Water Services, Vol. 79, No. 958, p. 507-508, 1975.

Descriptors: *Sewage treatment, *Industrial wastes, *Domestic wastes, Treatment facilities, Separated sewers, Interceptor sewers, Cost repayment, Landfills, Landscaping, Sludge treatment, Europe, Pollution abatement.
Identifiers: *Combined waste treatment, Badische Anilin- and Soda-Fabrik, *Rhine River(Germany), Ludwigshafen(Germany), Frankenthal(Germany).

Badische Anilin- and Soda-Fabrik at Ludwigshafen, Germany, has completed a waste treatment plant covering 86 acres. The facility also treats the sewage of the cities of Ludwigshafen and Frankenthal. The investment represents 200 million deutsche marks, with operating costs of DM 70 million annually. The effluent from BASF and Ludwigshafen totals approximately 185 mgd and is collected in an interceptor sewer where it is neutralized. After r emoval of coarse solids, the waste water is pumped through pressure mains; the Frankenthal sewage is then added and filtered; then directed to primary sedimentation tanks, then to aeration basins. BOD is reduced 95%, COD and TOD are reduced 75%; 70-100 ppm nitrates are removed by the biological system. The concentrated sludge is treated with ash recycled from the sludge incineration process. The waste gases from sludge incineration are cleaned in electrostatic precipitators. Ludwigshafen pays for the cost of its sewage treatment based on the BOD load. The final, clarifed effluent (restricted to 20/30 ppm BOD, 20/40 ppm SS, and a temperature not to exceed 30C) is released to the Rhine River. Solid wastes are landfilled on a 198-acre island site by a process developed by BASF. The various treatment procedures are described. (Auen-Wisconsin).

Descriptors: *Effluents, Wastes, Water pollution sources, *Industrial wastes, Waste water disposal, *Milk, Potatoes, Nitrogen, Potassium, E. coli, *Bacteria, Magnesium, Phosphorus, Salmonella, *Disinfection, Waste water treatment.
Identifiers: Amino-Acids, *Cows, Escherichia-Coli, Staphylococcus, Starch, *Bacteria removal processes.

Milk from cows which ate pasture sprinkled with waste effluents from a potato starch factor was studied. The best method for removing N compounds and K from the wastes was determined. Wastes containing high ratios of various elements were decanted. Concentrations of N, K and P were about 2000, 2800 and 300 ppm, respectively. The bacteria in the wastes were mostly common bacteria (105-108/ml) and Escherichia coli groups (10-106/ml). Salmonella and Staphylococcus were also present. Most of these bacteria came from the soil. The growth and yeild of grass sprinkled with wastes were very good, although unusual amounts of nitrate, K and P accumulated in the grass. No statistically significant differences were recognizable in milk composition from cows which grazed either the experimental or control pastures. In the sprinkled pasture the P content in the milk was slightly higher than normal and the Mg content in the milk slightly lower, although these values were not abnormal. Only slight traces of nitrate and nitrite were detectable in the milk from both pastures. Of the N compounds in the decanted wastes, 40-45% were removed by heat (70 C); 25% of the waste N content could be decreased by this method. About 80% of non-protein N and 95% of the K were removed from the decanted wastes by ion-exchange.–Copyright 1976, Biological Abstracts, Inc.

CENTRIFUGE PLUS LIME LIMITS LIGNIN IN WASTE WATER,
R. Moll.
Southern Pulp and Paper Manufacturer, Vol. 39, No. 6, p 14-15, June, 1976. 1 fig, 3 illus, 1 tab.

Descriptors: *Pulp wastes, *Lignins, *Lime, *Chemical precipitation, *Waste water treatment, *Centrifugation, Wastes, Industrial wastes, Waste treatment, Color, Sludge treatment, Burning, Water purification, Costs, Pulp and paper ind try, Water pollution sources, Water polluti treatment, Water pollution control, Treatm facilities, *Louisiana.
Identifiers: Clarifiers, Centrifuges.

Lignin is removed from the effluent of Continen Can Company's kraft mill at Hodge, Louisiana, adding lime and allowing the color bodies precipitate with the fiber fines in a clarifier. T sludge is removed and centrifuged in a model 5400 Super-D-Canter centrifuge. Dry cake tracted by the centrifuge is delivered to the li kiln for burning, together with the caustic mud tracted by vacuum filters. The solids content the centrifuge cake varies from 30 to 40%. T centrifuge removes 83.3% of the solids coming The cost of the entire waste treatment syste which includes all direct costs, as well as engine ing time and supervision costs, was $2,300,0 The system treats 9,000,000 gallons of fluent/day, equivalent to a paper production r of 750 tons/day. Descriptors: *Sulfite liquors, *Pulp wast *Color, *Waste water treatment, *Ultra-vio radiation, Wastes, Industrial wastes, Waste tre ment, Water pollution sources, Radiation, Wa pollution control, Water pollution treatment, ganic compounds, Oxygenation, Hydrogen concentration, Temperature, Chemical oxygen mand, Aeration, Pollution abatement, Irradiatio
Identifiers: Rose bengal, Periodates, Ace acetone, Hydrogen peroxide, Photochemist *Photochemical treatment.

Earlier work proved that various kinds of sp pulping liquors could be decolored by fairly lo irradiation with high-pressure UV lamps. Furth studies concentrated on shortening the irradiati of spent neutral sulfite semichemical liquor c taining 250 ppm of organic matter which had th far defied effective decolorization. Among fluential factors examined (oxygenation, air bu bling, pH, temperature), oxygen bubbling was most effective. It accelerated the photo-induc decoloring rate in both alkaline and acid med The effect increased at elevated temperature. T best decoloration (90%) and a 40% COD decrea were achieved at pH 12 and 60C upon irradiati plus oxygen bubbling for about 2 hr. Seve chemical additives were tried during room-te perature irradiation for 1.5 hr (alkaline) or 2.5 (acidic). The best result (about 90% color remov was obtained with 25 ppm of rose bengal a periodate at pH 12 or 5, or with acetyl acetone a hydrogen peroxide at pH 5. Lower amounts rose bengal sufficed at pH 5 to attain significa decoloring effects. (Brown-IPC)

WATER QUALITY ASPECTS OF WEL RECHARGE WITH RECLAIMED WATER, BA PARK, NEW YORK,
Geological Survey, Albany, N.Y.
J. Vecchioli.

n: Biological Control of Water Pollution; roceedings of the International Conference on iological Water Quality Alternatives, March 3-5, 975, University of Pennsylvania, Philadelphia, ennsylvania: American Society of Civil En-ineers, p 295-299, 1976. 1 fig, 1 tab, 4 ref.

escriptors: *Water reuse, *Injection wells, Artificial recharge, *Water quality, *New York, quifers, Reclaimed water, Water treatment, ewage treatment, Tertiary treatment, Chemical eactions, Water chemistry, Chemical analysis, Vaste water treatment.
dentifiers: Bay Park(NY), *Long Island(NY), lagothy aquifer(NY).

rom 1968 to 1973, water reclaimed from sewage as used in a series of deep-well artificial-echarge experiments at Bay Park, N. Y., by the J. S. Geological Survey in cooperation with the lassau County Department of Public Works. This aper summarizes water-quality aspects of the echarge tests. Microbial growth around the well creen caused significant well clogging when nchlorinated water was injected. The higher filter fficiency of the fine to medium sand of the quifer restricted movement of bacteria away rom the point of injection. In tests in which hlorinated water was recharged, clogging by icrobial growth was insignificant. However, henever there was an appreciable pause between he end of injection and the start of repumping, the irst water repumped had a strong sulfide odor, as highly turbid, and was laden with bacteria. Chemical quality of the reclaimed water was odified by interaction with the aquifer. Iron con-entration of the mixed native and reclaimed aters increased to as much as 3 milligrams per ter from background levels of a few tenths in ach; pH decreased to a low of about 4.5 from evels of about 5.5 for native water and 6.1 for eclaimed water. Residual phosphorus was emoved almost completely, but nitrogen uptake y the aquifer was minimal. (Woodard-USGS)

REGIONAL WASTEWATER SOLIDS MANAGEMENT PROGRAM LOS ANGELES-ORANGE COUNTY METROPOLITAN AREA,
Los Angeles-Orange County Sludge Program, Whittier, Calif.
D. Burack.
n: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 26-29. fig.

Descriptors: *Sludge disposal, *Sludge treatment, Recycling, *Programs, *Governmental interrelations, Waste disposal, Reclamation, Incineration, Dewatering, Byproducts, Solid wastes, Municipal wastes, California, Industrial wastes, Transportation, California.
dentifiers: Pyrolysis, Los Angeles(Calif), Orange County(Calif).

A regional waste water sludge management program for the Los Angeles-Orange County metropolitan area is described. The program is to be conducted under a Joint Powers Agreement by the three major waste water agencies in the region with the assistance of the State of California and the United States Environmental Protection Agency. The following disposal or recycling alternatives will be studied: recycling of waste water solids for agricultural uses, soil reclamation, and use as soil supplement; disposal of waste water solids to land; waste water solids disposal to the ocean; incineration and pyrolysis processes for volume reduction and resource recovery; and conditioning, dewatering, and composting. In conjunction with these alternatives, transportation and sludge processing as well as the disposal of industrial sludges will also be studied. (See also W77-00009) (Kreager-FIRL)

URBAN SLUDGE DISPOSAL OR UTILIZATION ALTERNATIVES, SOCIO-ECONOMIC FACTORS,
Environmental Protection Agency, Philadephia, Pa. Region III.
A. Montague.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 60-64. 4 tab.

Descriptors: *Sludge disposal, *Social aspects, Economics, *Municipal wastes, *Reclamation, Sludge treatment, Waste water treatment, Attitudes, Symbiosis.

Socio-economic factors affecting the implementation of various urban sludge disposal and utilization alternatives are discussed, with particular emphasis on land spreading. Although resistance in rural areas by neighboring communities to accept land spreading as a means of sludge utilization has been minimal, the same climate of receptiveness and cooperation has not yet developed in many large metropolitan areas. One source of concern hindering the use of municipal sludge for land spreading purposes is the heavy metal content of sludges. However, once psychological attitudes toward the utilization of waste materials become more favorable, the implementation of prudent management practices in sludge utilization should control the degree of environmental stress. The development of an active public awareness program on the benefits and liabilities of proposed sludge processing systems is recommended along with a realistic program for controlling heavy metals in waste water collection systems. Comparative costs of various sludge disposal and utilization techniques are presented to illustrate the economic advantages of landspreading sludge in specific situations. W77-00013

SLUDGE MANAGEMENT ALTERNATIVES FOR COASTAL CITIES,
Engineering-Science, Inc., Berkeley, Calif.
T. Bursztynsky, and J. Davis.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 65-72. 13 tab, 7 ref.

Descriptors: *Sludge disposal, *Municipal wastes, *Cost-benefit analysis, *Reclamation, *Social aspects, Economics, Waste disposal, Oceans, Feasibility studies, California.
Identifiers: Ocean disposal.

Findings from a study of seven alternative sludge disposal options for the Southern California coastal area are summarized. Ocean disposal appears to be the least cost option by a wide margin, and its total abandonment is considered a misallocation of resources unless the environmental impact is clearly demonstrated to be greater than that of more costly alternatives. Composting for sale appears to be the most desirable method of sludge management on an overall basis. Environmental risks are minimized and some benefits are realized. The system has good public acceptability, land use compatibility, ease of implementation, and financial feasibility. To a large extent this is the system being employed at Los Angeles and Orange Counties, indicating that natural selection processes of public pressure, economic considerations, and environmental awareness have been at work. Detailed breakdowns of environmental, feasibility, performance, and economic factors are presented for the various sludge management alternatives considered. (See also W77-00009) (Kreager-FIRL)
W77-00014

BY-PRODUCT SOLIDS MANAGEMENT ALTERNATIVES CONSIDERED FOR PHILADELPHIA,
Greeley and Hansen, Chicago, Ill.
E. F. Ballotti, and T. E. Wilson.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 73-79. 7 tab, 1 ref.

Descriptors: *Municipal wastes, *Solid wastes, *Waste water treatment, *Waste disposal, *Reclamation, Economics, Biological treatment, Byproducts, Fertilizers, Pennsylvania.
Identifiers: *Philadelphia(Penn).

Alternative methods of managing byproduct solids generated by waste water treatment plants in the Philadelphia area are discussed. Biological processes generally rank better than physical-chemical processes from a cost, energy, and nutrient utilization standpoint. A number of land disposal alternatives utilizing anaerobically digested solids appear to have potential as acceptable management programs; however, it does not appear that a land disposal alternative is feasible for the total amount of solids removed in Philadelphia. The sea dispersal alternative, also utilizing anaerobic digestion as the stabilization process, has proven to be simple, economical, and easily controlled. Preliminary feasibility studies on an anhydrous and liquid ammonia alternative appear promosing. This alternative utilizes anaerobic digestion and converts excess digestion gas to the form of fertilizer commonly used for crop fertilization in the United States. (See also W77-00009) (Kreager-FIRL)
W77-00015

SLUDGE DISPOSAL ALTERNATIVES FOR BOSTON,
Havens and Emerson Ltd., Cleveland, Ohio.
G. D. Simpson.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California p 80-85. 1 fig, 5 tab, 5 ref.

Descriptors: *Sludge disposal, *Municipal wastes, *Incineration, *Cost-benefit analysis, *Dewatering, Reclamation, Byproducts, Programs, Waste water treatment, Massachusetts, Waste disposal, Land use, Feasibility studies.

Findings from a study of sludge disposal alternatives for the city of Boston are presented. Among three final alternatives considered (land application, dewatering and incineration, and wet oxidation), dewatering and incineration is the least cost option, being lower in capital cost than the nearest alternative by about $7.6 million and lower in total annual cost by about $1.6 million/year. From environmental and other non-cost standpoints, incineration rates are equal to or better than the other two alternatives in seven of nine categories; whereas land application rates are equal to or better than the other alternatives in only three of

nine categories. Based on the above findings, a detailed project plan is for chemically conditioning, vacuum filtering, and incinerating sludge from Boston's waste water treatment plants. Incinerator ash will be utilized for landfill to provide additional space required for a future secondary treatment plant. Ash leachate will be collected and recycled to treatment. ALTERNATIVES FOR DISPOSAL FOR THE METROPOLITAN DENVER SEWAGE DISPOSAL DISTRICT NO. 1,
Metropolitan Denver Sewage Disposal District Number 1, Commerce City, Colo.
W. J. Martin, and J. D. Boyle.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California p 86-90.

Descriptors: *Sludge disposal, *Municipal wastes, *Reclamation, *Feasibilty studies, *Economics, Cities, Colorado, Recycling, Symbiosis, Fertilizers, Waste water treatment, Byproducts.
Identifiers: *Denver(Colo).

Findings from a study of alternative methods for disposing of or utilizing sludge generated by waste water treatment facilities in the Metropolitan Denver area are presented. Agricultural reuse is considered the most desirable sludge managemet system for the district based on environmental, engineering, and economic considerations. The system requires little power compared to other alternatives, and methane gas which is a byproduct of anaerobic digestion can be used to heat and mix the digesters. Outside fuel power will be required only to operate various pumps in the system and vehicles at the drying and distribution center. The reuse system is also attractive because of its relatively simple operation and inherent flexibility for final sludge use. Additionally, the fertilizer or soil conditioner produced from sludge is a valuable agricultural resource in view of current and projected fertilizer shortages. Research efforts being conducted by the Metropolitan Denver Sewage Disposal District on the environmental impact of sludge utilization are also outlined. (See also W77-00009) (Kreager-FIRL).

THE PAST, PRESENT, AND FUTURE PROSPECTS OF BURNING MUNICIPAL SEWAGE SLUDGE ALONG WITH MIXED MUNICIPAL REFUSE,
Weston (Roy F.) Inc., West Chester, Pa.
E. M. Smith, and A. R. Daly.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 115-123. 4 fig, 1 tab, 35 ref.

Descriptors: *Sludge disposal, *Incineration, *Municipal wastes, *Sewage sludge, Treatment facilities, Dewatering, Drying.
Identifiers: Co-incineration, Mixed municipal refuse.

The use of co-incineration for burning municipal sewage sludge along with mixed municipal refuse is discussed in terms of past experience and future prospects. Experience with burning sludge in conventional refractory-wall mixed municipal refuse incinerators indicates that the moisture present in the sewage sludge depresses furnace temperature, thus necessitating reductions in excess air to hold the furnace gas temperature within the desirable range of 1400-1800F. However, when thickened sludge feed is used, adequate furnace temperatures can not be maintained even with zero excess air. Thus, it is necessary to dewater the sludge to about 20% solids, followed by drying, before the sludge solids are fed to the incinerator. A co-incineration option for the future is the use of conventional sludge incinerators modified to handle shredded and cleansed mixed municipal refuse. Various experimental co-incineration installations presently in operation throughout the world are described. (See also W77-00009) (Kreager-FIRL)

PYROLYSIS OF SEWAGE SLUDGE,
Environmental Protection Agency, Cincinnati, Ohio.
R. A. Olexsey.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 139-145. 4 fig, 6 tab, 13 ref.

Descriptors: *Sludge disposal, *Sewage sludge, *Organic compounds, *Distillation, Incineration, Waste disposal, Pilot plants, Feasibility studies, Moisture content.
Identifiers: *Pyrolysis, Refuse.

The feasibility of using pyrolysis for sewage sludge disposal is discussed along with some preliminary findings from pilot-scale tests conducted by the Environmental Protection Agency and the Bureau of Mines. Pyrolysis is the destructive distillation of organic materials under heat and/or pressure in the absence of oxygen. Tests involving the pyrolysis of sludge alone reveal that the process represents a substantial improvement over conventional incineration with respect to fuel consumption and air pollutant emissions. However, the high moisture content of sewage sludge favors the use of a combination of sludge and dry organic material to reduce the energy requirements associated with evaporating the moisture in the sludge. Tests with mixtures of sludge and shredded solid waste indicate that this approach is feasible, although both the environmental aspects and economics of the process require further investigation. (See also W77-0009) (Kreager-FIRL)

SLUDGE PYROLYSIS FOR ENERGY RECOVERY AND POLLUTION CONTROL,
Stanford Research Inst., Menlo Park, Calif.
F. M. Lewis.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 146-152. 6 fig, 1 tab, 9 ref.

Descriptors: *Sludge disposal, *Distillation, *Waste treatment, *Energy conversion, *Thermodynamics, Treatment facilities, Heavy metals, Incineration, Economics.
Identifiers: *Pyrolysis.

The use of pyrolysis for sludge decomposition is discussed. Pyrolysis is an irreversible chemical change brought about by the action of heat in an atmosphere devoid of oxygen and offers advantages over conventional incineration in terms of fuel economy, energy recovery (steam generation), and control of heavy metals. An analysis the thermodynamics of various pyrolysis syste reveals that a proprietary pyrolysis reactor tha indirectly heated by the afterburner flue produ requires the least amount of auxiliary fuel. maximum efficiency in pyrolysis systems, a h solids content in the sludge cake and a low exc air rate are desirable. Techniques are curren available for producing a sludge cake in excess 40% total solids. The steam generated by a pyr sis system treating sludge can be used for generation of electricity or for operation of ac tors and pumps at waste water treatment pla (See also W77-00009) (Kreager-FIRL)

A SLUDGE POLICY FOR THE 70'S,
Environmental Protection Agency, San Francis Calif. Region IX.
L. R. Freeman.
In: Proceedings of the 1975 National Confere on Municipal Sludge Management and Dispo August 18-20, 1975, Anaheim, California, p 1 155.

Descriptors: *Sludge disposal, *Municipal wast *Legal aspects, *Institutions, Programs, Wa disposal, Conservation, Recycling, Reclamatio

Municipal sludge disposal is discussed in terms the responsibilities of the Environmental Prot tion Agency for setting a policy consistent w recent environmental legislation. Since Fede law and Federal/state policies require that feasi alternatives to ocean disposal must be pursu the first step in formulating a sludge dispo technique should involve the reclamation recycling of it in light of current conservat needs. Emphasis is placed on implementing ex ing technology to deal with existing or impend sludge disposal problems. The importance of fective institutional arrangements and public p ticipation in the implementation of sludge dispo policies is discussed. (See also W77-000 (Kreager-FIRL)

ECOLOGICAL IMPACT OF THE DISPOSAL MUNICIPAL SLUDGE ONTO LAND,
McCormick (Jack) and Associates, Inc., Dev Pa.
J. Schmid, D. Pennington, and J. McCormick
In: Proceedings of the 1975 National Conferen on Municipal Sludge Management and Dispo August 18-20, 1975, Anaheim, California, p 1 168. 9 fig, 2 tab, 16 ref.

Descriptors: *Sludge disposal, *Municipal wast *Ecology, *Land use, Agriculture, Wa disposal, Legislation, Reclamation, Recycli Symbiosis.

An evaluation of the ecological impact of disp ing of municipal sludge on land is present against the background of current water polluti legislation. A review of major land uses a characteristics in the United States and the pot tial impact of land disposal on natural vegetati and wildlife indicates that sludge disposal on la can be environmentally acceptable. Sludge ap cation, as contrasted to land-filling, is m apropriate. The most attractive sites for slud disposal appear to be those that are presently u ized for crop and livestock production. The mu ple use of these lands should be considered a h tional priority so that waste water can be reused improve soil conditions and fertility. Appro mately 18% of the total land surface in the cont minous states is considered to be unsuitable land disposal. (See also W77-00009) (Kreag FIRL)

ENGINEERING STUDY AND FIELD DEMONSTRATION TRIALS FOR SAND DUNE STABILIZATION,
Ward (George D.) and Associates, Portland, Oreg.
G. D. Ward.
In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 200-203. 1 tab.

Descriptors: *Dunes, *On-site tests, *Soil stabilization, *Organic wastes, *Wind erosion, Erosion control, Soil erosion, Oregon.

Organic wastes were used in soil stabilization studies in a severe wind erosion area in northeast Oregon. The first study involved soil building using fiberous wastes. Numerous solid wastes in various concentrations were incorporated into a sandblow, which was then planted with dryland grasses in late 1972 and evaluated in 1973. The second study applied on a larger scale the sand control procedures which were found effective during the first study. Physical stabilization and seeding procedures were undertaken during the fall of 1973 and early spring of 1974. The program is similar to programs in Israel, the Isle of Jersey in the English Channel, and the Lowry Bombing Range in Colorado. In Israel, shredded municipal waste is covered with a layer of sand, then reseeded with desert vegetation. On Jersey, composted and shredded municipal waste, blended with blowsand, is used for developing turf. In Colorado, Denver's total sewage sludge is used to build soil. A layer of the sludge, which is mechanically thickened, is deposited, plowed, disced, and then seeded. The result is healthy range grass which is productive and resistant to wind erosion. Organic wastes successfully used in Oregon include liquid sewage sludge, papermill sludge, shredded bark and woodwastes, and feedlot bedding. A nitrogen source such as sewage sludge or feedlot waste must be provided with papermill sludge. (See also W77-00009) (Snyder-FIRL)

In: Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal, August 18-20, 1975, Anaheim, California, p 214-217. 3 tab.

Descriptors: Pollutant identification, *Public health, *Hazards, *Land use, *Sludge, Municipal wastes, Waste water(Pollution), Federal government.
Identifiers: Food and Drug Administration.

While proper use of good sludge on crops would not normally be expected to present a problem, contamination when sludges are improperly processed or applied on the wrong crops is of concern to the Food and Drug Administration (FDA). Direct physical contact with crops is a possible contamination mechanism. Contaminants may be retained in tissues of animals exposed when grazing or eating forage. Complete definitions of safe practices are currently unavailable due to insufficient data on the transfer of many contaminants through the food chain and on the toxicological effects to be expected. Many metals, including cadmium, are found at higher levels in crops grown on sludged soil than in controls in the same area. Sewage sludge contains persistent organic contaminants. Studies have shown that edible parts of plants contain these organics at levels 5 to 20% of the levels in the soils. The most likely contamination of foods would be in animals coming in contact with sludge and following failures of the sewage plant operation. The microbiologists feel crops eaten raw should not be planted within 3 yr of the last sludge application. Related FDA activities include surveys for heavy metals and pesticides in agricultural products, development of analytical methodology for heavy metals and pesticides, investigations on the survival of pathogens on vegetables grown in sludge treated soil, and toxicological studies to determine the effects of heavy metals and interaction between elements. There is currently no indication that sludge use must be limited to crops not in the human food chain or that all sludges are suitable for land application. (See also W77-00009) (Snyder-FIRL)

CHEMICAL CHANGES IN THE SOIL SOLUTION FROM A SPODOSOL IRRIGATED WITH SECONDARY-TREATED SEWAGE EFFLUENT,
Florida Agricultural Experiment Station, Gainesville. Soil Science Dept.
C. C. Hortenstine.
Journal of Environmental Quality, Vol. 5, No. 3, p 325-338, July-September, 1976. 6 fig, 1 tab, 10 ref.

Descriptors: *Irrigation effects, *Waste water disposal, *Soil analysis, *Chemical analysis, Nitrogen, Phosphorus, Potassium, Nitrates, Nitrification, On-site investigations.
Identifiers: Spodosols.

Chemical changes in spodosols from near Orlando, Florida were investigated after irrigation with secondary-treated sewage effluent. Irrigation at a rate of 5 cm/week was initiated in July 1972 in an attempt to determine the renovative capability of the Spodosols. Phosphorus content increased from 0.03 ppm at all soil depths in the fall/winter of 1971/1972 to 1.25 ppm at 60 cm, 1.00 ppm at 90 cm, and 0.85 ppm at 120 cm by the fall of 1974. During this same period, potassium increased from 0.05 ppm at all three depths to 14 ppm. Nitrate-nitrogen, however, was consistently below 1.0 ppm. The effluent contained an average of 2.2 ppm nitrate-nitrogen, 14 ppm Kjeldahl nitrogen, 2.8 ppm phosphorus, and 16 ppm potassium. Laboratory tests of the soil indicated satisfactory nitrification; however, adverse conditions in the field curtailed the nitrifying process. Proper water control by tile installations will likely provide conditions that are suitable for nitrification. (Kreager-FIRL)

WASTEWATER SLUDGE AS A FERTILIZER SUBSTITUTE,
Ohio State Univ., Columbus. Dept. of Agricultural Economics and Rural Sociology.
D. L. Forster, T. J. Logan, R. H. Miller, and R. K. White.
Public Works, Vol. 107, No. 8, p 79-80, August, 1976. 2 tab, 3 ref.

Descriptors: *Sewage sludge, *Fertilizers, *Sludge disposal, *Farms, Costs, Irrigation, Overland flow, Ohio, Surveys, Viruses, Heavy metals, Monitoring, Attitudes.
Identifiers: Land spreading.

Data from a survey of waste water sludge land spreading practices in 43 communities throughout the state of Ohio are presented. The survey showed that all but nine of the communities using sludge as fertilizer were employing some type of sludge analysis at least semi-annually. About a third of the communities were also checking water quality near disposal sites. The equipment used for applying the sludge to land consisted mostly of tank trucks with either gravity or pumped discharge. Only four of the communities employed irrigation-overland flow systems. Average sludge handling costs per dry ton ranged from $25.20 for a plant flow capacity of 20 million gallons/day to $69.70 for a flow of 2 million gallons/day. Negative attitudes among landowners were associated mostly with concern about the possible existence of heavy metals, the possible survival of pathogenic viruses and human parasites, and the effect of runoff on water quality. (Kreager-FIRL)

WASTES FIND FERTILE FIELD AS LOW-COST PLANT NUTRIENTS,
P. M. Kohn.
Chemical Engineering, Vol. 83, No. 16, p 43-45, August 2, 1976. 1 fig.

Descriptors: *Waste treatment, *Sludge treatment, *Fertilizers, *Recycling, *Symbiosis, Municipal wastes, Industrial wastes, Sludge treatment, Economics, Nitrogen, Phosphorus, Potassium, Chemical wastes.

Developments in the use of transformed liquid waste as fertilizer are reviewed along with problems hindering the increased recycling of such wastes. The city of Houston, Texas, is presently flash-drying its activated sludge to form a material called 'Hou-Actinite.' The product has a nitrogen-phosphorus-potassium analysis of 5-5-0 and is sold to Texas rice farmers, Florida citrus growers and others. Hou-Actinite sells at $25-31/ton. Although this price brings no profit, the conversion of sludge to Hou-Actinite is preferable to using landfill as a disposal means. Pacific Disposal Systems, Incorporated, a firm that handles hazardous chemical wastes, plans to go onstream in the near future with a system that will convert waste nitric acid to ammonium nitrate which will be marketed as a fertilizer. Major drawbacks to the widespread use of wastes as fertilizers include their low nitrogen-phosphorus-potassium nutrient value, their high bulk and water content, and their variable quality. Also, the low value of such fertilizers makes their storage expense relatively high. (Kreager-FIRL)

MANGANESE AND IRON REMOVAL FROM WATER BY ADSORPTION ON DIATOMACEOUS EARTH,
Rhode Island Univ., Kingston. Dept. of Mechanical Engineering and Applied Mechanics.
F. J. DeLuise.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 776, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1976). 13 p, 6 fig, 3 ref. OWRT A-053-RI(1). 14-34-0001-6041.

Descriptors: *Manganese, *Iron, *Adsorption, Filtration, *Diatomaceous earth, Oxidation, *Water treatment, Methodology.

The removal of manganese from water supplies has always been a difficult practical problem because of the high filtration resistance caused by oxidized manganese. A method to reduce this resistance is investigated. Manganese and iron in water are oxidized under controlled conditions to form polymeric hydroxo complexes which are then adsorbed on diatomaceous earth and subsequently removed with the diatomaceous earth by a filtration process. Results with various grades and concentrations of diatomaceous earth are shown.

Identifiers: Essen(Germany), Picornavirus, *Polioviruses, Ozonation, *West Germany.

Defined quantities of Cl and ozone were examined for their poliovirus-inactivating effect in water without redox potential double-distilled water), water with low defined redox potential (double-distilled water + KOH), previously chlorinated water with a residual Cl content of 0.03 mg Cl/l (tap water) and water with a high redox potential (well water from the drinking water plant). Cl and ozone are essentially equivalent disinfectants. The initial rate and the kinetics of virus disinfection are identical. The efficacy of both disinfectants is affected by the condition of the water (redox potential, pH, etc.). In Essen (West Germany) reservoir water, good virus disinfection can be had with 1.0-1.5 mg ozone/liter (dissolved); such a concentration guarantees very little residual ozone. Continuous checking of the redox potential and the amount of the ozone added is necessary. Ozonation of water, probably by the cleavage of humic acid, promotes bacterial recontamination of the drinking water in city taps. Pre-ozonation combined with subsequent chlorination would guarantee safety and aesthetic improvement of the drinking water. Such a combination would be feasible with highly reduced amounts of ozone and Cl.--Copyright 1976, Biological Abstracts, Inc.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 677, Price codes: A05 in paper copy, A01 in microfiche. Completion Report No. 7422, Aug 76. 85 p, 24 fig, 9 tab, 87 ref. OWRT C-6134(5215)(1).

Descriptors: *Water quality, *Planning, *Project evaluation, *Frequency analysis, Benefit cost analysis, Benefits, Damages, Probability, Mathematical models, Hydrologic models, Simulation analysis.
Identifiers: Continuous simulation, Cost-effectiveness, Economic evaluation, Water quality modeling.

Demonstrated is a methodology for the evaluation of water quality plans analogous to procedures used in flood control planning, where flood damage frequency curves provide the basis for determining flood control benefits. The proposed methodology utilizes continuous water quality simulation to develop long term water quality information from which water quality frequency curves can be obtained. This frequency information allows the evaluation of the physical performance and impacts of proposed water quality control plans with specific consideration of the variable nature of the water resource. Using treatment costs and other economic indicators of water quality, the water quality frequency information can be used to estimate the cost-effectiveness and economic efficiency of alternative plans. The methodology is demonstrated in a typical urban environment; real hydrologic and climatic characteristics are assigned to an assumed watershed configuration. Alternate waste treatment levels, in-stream aeration, flow augmentation, and non-point source control plans are simulated and analyzed for both physical and economic impacts. The advantages of continuous simulation and its use in water quality planning are explored.

CLOSED LOOP HIERARCHICAL CONTROL FOR RIVER POLLUTION,
Saint John's Coll., Cambridge (England).
M. G. Singh, and M. Hassan.
Automatica, Vol. 12, No. 3, p 261-264, May, 1976. 3 fig, 3 tab, 11 ref.

Descriptors: *Water pollution control, *Rivers, *Mathematical models, Biochemical oxygen demand, Dissolved oxygen, Water quality control, Surface waters, Simulation analysis.

A feedback solution is obtained for a two-polluter river pollution control problem using a hierarchial method. The hierarchial optimization algorithm uses continuous time No Delay, Pure Delay, and Distributed Delay models of the Cam River near Cambridge. All of the calculations are done off-line within a decentralized computational structure. The resulting constant gains provide optimal feedback control for any initial condition, and this control can be implemented on-line. The method is also demonstrated on a three-polluter Distributed Delay model. Various simulation studies on river pollution problems associated with biochemical oxygen demand and dissolved oxygen show the efficacy of the method for river pollution control. (Kreager-FIRL)

IDELINES FOR SEDIMENT CONTROL IN RIGATION RETURN FLOW,
icultural Research Service, Kimberly, Idaho.
ke River Conservation Research Center.
. Carter.
rnal of Environmental Quality, Vol. 5, No. 2, p -124, April-June 1976. 1 tab, 17 ref.

scriptors: *Return flow, *Erosion control, igation water, *Sediment control, *Irrigation ctices, Water quality, Agriculture, Runoff, w, Furrow irrigation, Erosion, Cultivation, Fil- ion.
ntifiers: Soil loss.

liments in irrigation return flows arise mostly m erosion in furrows during irrigation, and sedi- nt concentrations vary widely from near zero to eral thousand ppm. Reducing both erosion and off would decrease the sediment in return ws. Technology is available for reducing both sion during irrigation and soil loss from the d, and for removing sediments from return ws. This technology was discussed, and the fol- ing guidelines were suggested: (1) Eliminate or uce irrigation return flows when conditions mit using irrigation methods with little or no ru- f. (2) Control the irrigation furrow slope so that run is across the steepest slope or on the con- r. Decrease the slope near the end of the furrow reduce the flow velocity and increase sedimen- on. (3) Control the furrow stream size and ke proper stream adjustments. Adequate water asuring equipment and controls are essential proper stream size control. (4) Shorten the run gth. (5) Control the irrigation duration to reduce number of irrigations per season. Alternate row irrigation reduces the contact between soil d flowing water and subsequent erosion. (6) Cul- ate only when necessary, avoiding excessive l loosening which increases erosion and soil s. (7) Control tailwater by assuring that it flows wly enough that sediments settle before the ter leaves the field. Filtering through grass ips removes sediments. (8) Utilize sediment re- tion basins to remove sediment from return ws. (Lee-ISWS)

entifiers: *Comprehensive Water Quality anagement Planning Program(COWAMP), Waste water management.

e planning process of Pennsylvania's Com- ehensive Water Quality Management Planning ogram (COWAMP) is reviewed. The program compasses all aspects of waste-water manage- ent and pollution control, including point and n-point sources of pollution, agricultural runoff, andoned mine drainage, sludge disposal and oundwater quality protection. COWAMP, a ree year program established in the Department Environmental Resources in 1974, seeks to entify physical, financial, institutional and regu- tory steps involved in formulating its water anagement plan which is due in 1977. OWAMP's goal is to formulate a feasible plan at will achieve and maintain surface and ground- ater quality in an economically responsible anner, and consistent with other environmental als. Data collection involved topography, geolo- and climate of the 9 study areas the state was vided into (along hydrological boundaries); sur- ce and groundwater hydrology; population figures and present land use; existing water quality standards and methods used in water quality management; and soil classification. From these data 2 projections were made: prediction of the future based on historical trends, and a projection considering special environmental concerns expressed by local study committees. A cooperative arrangement between regional planning agencies, consulting firms and the Department of Environmental Resources was established to encourage public participation. In this way communication was facilitated between local advisory committees and the state. (Gentry-North Carolina).

A RELIABILITY ASSESSMENT FOR REGIONAL WATER QUALITY MANAGEMENT,
Texas Univ., San Antonio. Div. of Environmental Studies.
C. S. Shih.
Computers and Operations Research, Vol 3, No 2/3, p 145-155, August 1976. 9 fig, 1 tab, 4 ref.

Descriptors: *Water quality control, *Reliability, *Simulation analysis, *Optimization, *River basins, Management, Regional analysis, Assessment, Stochastic processes, Decision making, Streams, Waste water treatment, Annual, Operation and maintenance, Costs, Amortization, Equations, Mathematical models, Systems analysis, *Texas.
Identifiers: *Cost minimization, *Stochastic quadratic programming, Transition functions, Chance constraints, Linear constraints, Multiple linear regression, Sensitivity analysis, *San Antonio River Basin(Tex).

Deterministic criteria have always been employed in establishing managerial goals for urban water quality management. However, the different parameters, such as quantity and quality of waste treatment discharges, irrigation return flows and urban runoff, that characterize regional water quality are probabilistic in nature. Thus, the attainment of managerial goals will inherently exhibit the characteristics of uncertainty. Herein, the concept of reliability of water quality of a stream system is introduced. Reliability is defined as the percentage of time that specific water quality managerial goals can be attained. A simulation-optimization model has been developed for decision-making in regional water quality management. Stochastic quadratic programming techniques have been used in optimizing the basin-wide quality control strategy subject to a probabilistic constraint which reflects the desired reliability of the stream system. The optimization scheme facilitates the determination of the best pollution control decisions for each treatment facility while minimizing the total regional annual cost, subject to the quality criteria, and the desired level of reliability. Practical application of the model to the San Antonio River Basin, Texas, has been analyzed and a sensitivity analysis conducted which is based on varying degrees of the system reliability. Computers and Operations Research, Vol 3, No 2/3, p 229-240, August 1976. 8 fig, 15 ref.

Descriptors: *Planning, *Computers, *Water quality, *Management, *Water pollution control, Computer programs, Optimization, Simulation analysis, River basins, Costs, Economics, Mathematical models, Operations research.
Identifiers: *Data base management system, *Query language.

A generalizing planning system (GPLAN) is presented which allows for a collection of operations research models to be easily integrated with a data base management system. An example is discussed dealing with a water pollution problem, which is analyzed for its structural complexity and informational requirements; a high level query language is discussed which allows a planner to use such a system without particular computer expertise. The technique presented provides participants in the planning process with information about the costs and water quality effects of alternative treatment strategies. The method has two aspects: (1) simulation, involving the capacity to determine the water quality characteristics implied by a given treatment strategy; and (2) optimization, to minimize the basin-wide treatment costs, subject to satisfaction of water quality goals. GPLAN is capable of supporting data bases and models for a wide variety of planning problems. (Bell-Cornell)

OPTIMIZATION OF STATE WATER QUALITY MONITORING SYSTEMS,
Environmental Research Lab., Corvallis. Oreg.
D. H. Lewis.
Computers and Operations Research, Vol. 3, No. 2/3, p 127-143, August 1976. 3 fig, 6 tab, 7 ref.

Descriptors: *Water quality, *Monitoring, *Optimization, *Water pollution control, Methodology, Networks, Sampling, Federal Water Pollution Control Act, Probability, Resource allocation, Effluents, Standards, River basins, Design, Computers, Operations research.
Identifiers: Steepest descent technique, Maximum marginal return, Wabash River(Ind Ill), Environmental cost minimization.

The water quality monitoring activities required of the States under the Federal Water Pollution Control Act Ammendments (PL92-500) will require resources well beyond what is likely to be available, if current systems structures and operating procedures are followed. This paper describes some quantitative procedures developed to optimize monitoring resource allocation, with the goal of getting the greatest possible return on a limited monitoring budget. The ambient and effluent standards which form the basis of the monitoring system are described. Stochastic inputs to the river basin which lead to violations of these standards are identified, and progress in characterizing these variations mathematically is discussed. Quantitative priority-setting procedures for the two principal monitoring activities (ambient and effluent), which account for these stochastic inputs are reviewed. Both procedures are designed to tell the state agency planner where the next increment of resource should be expended to maximize alternative monitoring objective functions. Approaches to integrating these two primary monitoring functions and opportunities for further applications of operations research techniques to improve program effectiveness and efficiency are suggested. SOME THOUGHTS ON ZERO DISCHARGE,
Monroe County Drain Commission, Mich.
P. Fleming.

Engineering Issues, Journal of Professional Activities, Proceedings of the American Society of Civil Engineers, Vol. 102, No. E12, p 179-181, April 1976.

Descriptors: *Water pollution, *Sewage, *Effluents, *Natural resources, Archaeology, Ecology, Conservation, Legislation, Pollution abatement.
Identifiers: *Federal laws, *Professional activities, *Zero discharge.

The concept of zero discharge, as presented in the Federal Water Pollution Control Act Amendments of 1972, Public Law 92-500, is based on a philosophy that man is basically not compatible with nature. The long-term effects of such a philosphy are difficult to see, but at best, little good can come from disenfranchising man from nature. As an alternative, the goal of water pollution abatement should be to seek ways in which the waste products of man's activity can be returned to the environmental cycle in a way that represents the best long-term interests of man. A REGIONAL MARKET FOR RIGHTS TO USER FERTILIZER AS A MEANS OF ACHIEVING WATER QUALITY STANDARDS,
Illinois Univ. at Urbana-Champaign. Dept. of Agricultural Economics.
C. R. Taylor.
Journal of Environmental Economics and Management, Vol. 2, No. 1, p. 7-17, 1975. 3 fig., 4 tab., 12 ref.

Descriptors: *Control, *Rates of application, *Fertilizers, *Permits, *Taxes, Nitrogen, Nitrates, Nitrites, Water pollution control, Crop production, Illinois, Regional economics, Water quality.
Identifiers: *Fertilizer rights, *Fertilizer excise tax.

The market for rights to use nitrogen fertilizer policy is compared with a fixed per unit excise tax on fertilizer and some effects of these nitrogenous fertilizer restrictions on crop production in Illinois are empirically examined. It is shown that the net effect of the two policies on production and distribution of income from production at a given point would be the same only if no rights were purchased by nonusers of fertilizer. However, there were three important differences: (1) Different options are available to nonusers to influence the amount of fertilizer used, (2) the effects of adapting the policies to annual changes in economic conditions and social values differ, and (3) the rights policy allows more precise control over the total amount of fertilizer used, which is particularly important if a water quality standard is to be managed by controlling the use of fertilizer. Results also indicate that the use of a tax or rights policy in Illinois would increase nitrogen fertilizer use in other states, thus illustrating the need for a national coordination of fertilizer use policies. OFFSHORE INDUSTRIAL-PORT ISLANDS,
Delaware Univ., Newark. Coll. of Marine Studies.
R. B. Biggs.
Oceanus, Vol. 19, No. 1, p. 57-66, 1975.

Descriptors: *Offshore platforms, *Industrial plants, *Islands, *Design, Industrial wastes, Treatment facilities, Construction costs, Feasibility, Environmental effects, Legal aspects, Jurisdiction.
Identifiers: *Artificial sea-islands.

Because many major United States industrial centers dependent on water transportation are sited on estuaries too shallow to handle modern ships, too small to assimilate wastes, and valuable as a biological-recreational resource, the concept of a multipurpose offshore industrial-port island is discussed. Based on criteria for selection of island candidates (importance of industry to national economy and defence; history of plant site acquisition problems; source, volume, and form of raw materials needed; noxious, nuisance, or hazardous nature of the industry; and whether the industry is labor or capital intensive), possible candidate industries considered are petroleum refining, petrochemical manufacturing, electric power generation (fossil and nuclear), deepwater terminals, liquified natural gas regasification, urban solid-waste processing and disposal, fertilizer manufacturing, paper manufacturing, electrometals processing, iron reduction and steelmaking, and nuclear fuel reprocessing. A 500,000 barrel/day refinery core was selected as an example of a complex that could be constructed off the northeastern United States shore. The key input would be imported crude oil and/or oil produced in nearby offshore fields. Outputs would be refined petroleum products and petro-chemicals. Construction design and costs, environmental effects, labor transportation, and legal-jurisdictional issues are discussed. (Buchanan-Davidson—Wisconsin)

THE ENVIRONMENT AND THE STRUCTURE OF SOCIAL GOALS,
J. Klackova.
Eastern European Economics, Vol. 14, No. 1, p. 88-113, 1975. 1 tab., 2 ref.

Descriptors: *Pollution taxes(Charges), *Systems analysis, Economics, Pollution abatement, Pricing, Environmental effects, Costs, Social aspects, Mathematical studies, Welfare(Economics), Economic rent.
Identifiers: *Environmental quality, *Czechoslovakia, Socialism.

The fundamental economic aspects of environmental conservation in a socialist society are analyzed from a theoretical point of view. The central issue is to learn to quantitatively measure the social utility of the natural environment, viewing it as an article of consumption. A simplified three-element vector is formulated relating production, consumption, and environmen quality in a static situation. The environmen quality component is incorporated at the outset the planning/decision making process and plac on the same level in the system of material inc tives as the production/consumption activiti Financial payments for unit damage to the e vironment must equal the total social harm s fered by the community. In this way the effect investment in reducing damage is evaluated at t level of enterprise decision making and the inst lation of pollution control equipment will figure cost reduction due to lower payments for pol tion. In practice, the use of the price system a fixed environmental standards will not necessar guarantee a socially optimum allocation of acti ties. However, it is an acceptable method since is demonstrated that a uniform payment rate f waste and injurious substances achieves t desired environmental goals at the lowest soc cost. THE BUDDING ENVIRONMENTAL CLEAN-U (A VIEWPOINT): PART I. POLLUTION AN ENVIRONMENT,
Bordeaux-1 Univ., Talence (France). Dept. Geography.
R. H. Charlier, and M. Vigneaux.
International Journal of Environmental Studi Vol. 8, No. 2, p. 121-136, 1975. 11 fig.

Descriptors: *Environment, *Pollution abatemen Foreign countries, Air pollution, Water pollutio Thermal pollution, Eutrophication, Surveys, I dustrial production, Attitudes, Social aspect Long-term planning, Projections.

This first of a two-part paper deals with worldwi environmental degradation and current a proposed solutions of the resultant problems. T reactions and interactions of environmental fa tors are examined and some blatant cases of poll tion damage are cited. The concept of enviro ment; the process of the universe; physical facto such as climates, air, water, and soil; social facto such as rural and urban habitats, means of tra portation, and free time; adaptations, accommod tion an modifications; together with the i moderate actions of man are considered. Specif instances of pollution problems in the Unit States, the area of the Caspian Sea, the Sovi Union, Belgium, Germany, and Italy are brief stated. Recognition of these problems and vario countermeasures being taken to correct them a also briefly mentioned. Possible solutions all poi in the direction of education: humans must reeducated in terms of values, needs, want unemployment, obsolescence rate, recycling used raw materials, and a philosophical redirecti of interests away from our consumer-orient society. progress report is given on the development of a tal capability for rapid cleanup of oil spills in the reater San Francisco Bay Area and 340 miles of ean coastline outside the Bay by Clean Bay Inc., ten-member non-profit corporation formed on ly 1, 1971. CBI devised a three-phase Master an for completion by July 1, 1974; Evolved an oil ill contingency plan through testing and revion; Developed first aid capability available to ch member facility for small spill cleanup; stered closer working relationships with other est Coast oil spill cooperatives; and Impleented a concerted approach to working with vernmental agencies and environmental and wilife organizations. Major emphasis was placed on reparedness for massive spills, with a supporting le in minor incidents in conjunction with the first d capability of member companies. (See also 76-09312) (Sinha-OEIS)

he EPA prevention program as it related to naonal oil spill problems is discussed. The national rogram revolves around the spill prevention, conol and countermeasure (SPCC) concept which inorporates contingency planning, spill response nd prevention into one single comprehensive proram. This approach permits flexibility in design nd encourages innovation so that each facility ay develop an optimum plan to eliminate spills. It recognized that a facility's age, location and unction must be evaluated to determine the best alance between prevention measures and effecve spill response. The first phase of this program as initiated through special provisions of the efuse Act Permit Program. The program will be xpanded with the promulgation of the oil prevenon regulation which is being developed in acordance with Section 11(j)(1)(C) of the Federal Vater Pollution Control Act as amended. dentifiers: Production facilities, *Petroleum roduction, *Offshore technology, Pollution con-ol systems.

Spill prevention equipment and procedures using in offshore oil production are reviewed and the programs to achieve maximum protection by Exxon Company, U.S.A. and Industry are discussed. Several pollution prevention systems are utilized. Subsurface safety valves shut in the wells below the mud line if an emergency develops. Surface safety valves on each well provide automatic shut-in if an abnormal condition is detected by one of a large number of platform sensors. Oil leaks are retained in sumps. Sand erosion detectors are installed on wells to identify potential erosional failures before they can occur. It is concluded that various Industry and regulatory programs are providing the pollution control that is needed. Technological developments and reliability improvements are continuing. Ongoing work emphasizes development of improved subsurface safety valve concepts applicable to all wells, better manufacturing quality control and standards, and future reductions of human errors through training and safety programs. OIL SPILL PREVENTION MEASURES FOR THE TRANS-ALASKA PIPELINE SYSTEM,
Alyeska Pipeline Service Co., Houston, Tex.
E. W. Wellbaum.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 39-43.

Descriptors: *Pipelines, *Oil spills, *Oil pollution, *Oil industry, Accidents, *Earthquakes, *Environmental effects, Resources development, *Alaska, Safety factors, Natural resources, Weather, Hazards, Transportation, Planning.
Identifiers: *Trans-Alaska pipeline system, *Production facilities, *Petroleum production, Tankers, Spill prevention.

Alyeska Pipeline Service Company is responsible for design, construction, operation, and maintenance of the pipeline system which will move crude oil produced on the Alaskan North Slope along a route to Valdez, an ice free port located on an arm of Prince William Sound. At Valdez, the oil will be transferred to ocean going tankers. The amount of technical preplanning and the extent of environmental studies undertaken in preparation for this project are unprecedented. Oil spill contingency planning recognizes that despite the best efforts in design, construction, operation and maintenance, Alyeska must be prepared to handle an oil spill at any point on the system during its operating life. The maximum oil spill from complete separation of the pipeline will be limited by the placement of 136 check and remotely operated mainline valves. The maximum drainage after valve closure is 50,000 barrels and this can occur in only 1.5% of the line. The maximum drainage for over half of the line length is 15,000 barrels. Drainage basin studies are now being completed which will identify the route of flow of oil spills from each foot of the pipeline. Stream flow rates for summer, break-up, and floods are being determined so that the speed of the oil flow can be estimated. This data, along with snow, ice, and meteorological information will be stored in a computer data bank for use in generating oil spill response actions. Similar data is being collected for action plans for an oil spill in Port Valdez. It is Alyeska's intention to have oil spill contingency plans--which have been tested--completed on year before start-up of the system. (See also W76-09312)

DESIGN OF A REFINERY DOCK TO PREVENT OIL SPILLS,
Shell Oil Co., Wood River, Ill. Wood River Refinery.
L. D. Nieman, W. G. Cline, and C. R. Woodford.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 53-59, 8 fig.

Descriptors: *Oil spills, *Oil pollution, Water pollution, *Pollution abatement, *Water quality control, Mississippi River, Resources development, Docks, *Design.
Identifiers: Floating docks, Petroleum, Fuel transfer.

The modern dock operated by Shell Oil Company as part of the Wood River Refinery in Illinois was designed to include features which minimize the possibility of oil spills. The dock is located on the Mississippi River near St. Louis. It is comprised of four floating sections and is designed to load and unload barges only. Solid pipe loading arms are used to make the connections between the floating dock manifold and the barge header. The primary loading valves on the floats can be operated manually or electrically from a local station or remotely from the dock control center. Each floating dock is equipped with a drainage system to prevent spillage into the river. An intercom system provides communication between the dock control center and the loading areas. The dock operator is also in direct radio and telephone contact with refinery operating personnel responsible for the transfer of oil. Operation of this facility has met the criteria of efficient operation and protection against spills. (See also W76-09312) (Sinha-OEIS)

A DUAL PROGRAM FOR PREVENTION OF OIL SPILLS IN OFFSHORE DRILLING AND PRODUCING OPERATIONS,
Shell Oil Co., New Orleans, La.
R. L. Wilson, and O. J. Shirley.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 61-63.

Descriptors: *Oil spills, *Oil pollution, *Offshore platforms, *Water quality control, *Pollution abatement, Drilling, Accidents, Gulf of Mexico, Resources development, Safety, Operation and maintenance, Continental Shelf.
Identifiers: *Outer Continental Shelf, Waterways, Personnel training, Production activities, Equipment failure, Human error, Offshore technology.

Virtually all oil spills resulting from oil drilling and production activities in the Nation's waterways are caused by accidents. Therefore it follows that prevention of accidents and prevention of oil spills are synonymous objectives. Accidents can be broadly classified into two categories, that is those caused by equipment failure and those caused by human error. A program for accident prevention addressing both causes was developed and has now been fully implemented throughout Shell Oil Company's offshore operations in the Gulf of Mexico. PREVENTION--THE BEST METHOD OF CONTROLLING POLLUTION,
Sun Oil Co., Dallas, Tex.
F. C. Folger, Jr.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 65-67.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Offshore platforms, *Water quality control, Accidents, Environmental engineering drilling, Operation and Maintenance, Testing.
Identifiers: Personnel training, Equipment design, Production operations.

The primary objective of an environmental management program must be to prevent pollution. The techniques and procedures which are practical, readily applied, and easily administered are discussed. They can be incorporated into day-to-day operations with no disruption, and a minimum of additional effort. Equipment design (with particular respect to whether or not original design is still suitable for current operating conditions), alarm and shut-down systems, inspection and testing, maintenance, and operation are considered. Also considered are personnel training, definition of duties and responsibilities, and interdependence of personnel to achieve a common objective. (See also W76-09312) (Sinha-OEIS)
W77-00207

PREVENTION IS BEST,
Union Oil Co. of California, Los Angeles.
G. H. Hemmen.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1975. p 69-71.

Descriptors: *Oil spills, *Oil pollution, *Operation and Maintenance, *Pollution abatement, *Water quality control, Environmental effects, Oil industry, Oily wastes, Equipment, Accidents, Cathodic protection.
Identifiers: Petroleum.

The history of the development of fiberglass reinforced plastic tanks, tank testing equipment, line leak detectors, pre-engineered cathodic protection systems and wrapping are reviewed. The extent of usage by marketers together with pros and cons are indicated. Various approaches directed towards the safe disposition of waste oils are reviewed along with a description of the joint industry efforts underway to find new and better ways of achieving ecologically sound means of handling this problem. In addition to the preventive type of action, a brief discussion of emergency procedures is given. (See also W76-09312) (Sinha-OEIS)

DRAIN OIL DISPOSAL IN WISCONSIN,
Wisconsin Dept. of Natural Resources, Madison.
R. O. Ostrander, and S. J. Kleinert.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 73-78, 3 fig, 2 tab, 7 ref.

Descriptors: *Oil pollution, *Waste disposal, *Oil wastes, *Pollution abatement, Water pollution, *Environmental effects, *Wisconsin, Resources, Recycling.
Identifiers: *Drain oil disposal, Pollution prevention.

Service stations handle from 55 to 65% of the oil drained from crankcases in Wisconsin. Of this, 97.6% is re-used as lube oil, fuel oil, road oil or on farms. The remaining 2.4% is wasted but much of this is hauled to licensed disposal sites. For best use of a limited resource, drain oil should be re-refined as lube oil. Increased re-refining should be encouraged. A random sampling to determine the fate of oil drained by individuals is recommended so that we may have answers to this important segment of the overall problem. (See also W76-09312) (Sinha-OEIS)

OIL SPILL PREVENTION PRACTICES IN PIPELINES AND TERMINALS,
Sohio Pipe Line Corp., Cleveland, Ohio.
O. M. Turner.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, W[illegible]ngton, DC, March 13-15, 1973. p 79-84, 11 fig.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Pipelines, Storage tanks.
Identifiers: Personnel training, Terminal facilites, Terminals, Cargoe transfer, Containment.

Today, more than 200,000 miles of oil pipelines link a half-million oil wells with two hundred and fifty refineries and thousands of distribution terminals across the country. The petroleum industry goes to great lengths to assure the safety and reliability of its pipeline systems and terminal facilities. Both types of facilities require heavy capital investment, and both handle a commodity which is flammable. Routine petroleum transportation and storage practices have one major goal–product containment. Operating efficiency, safety, and pollution prevention are synonymous in pipeline transportation and storage, since the necessary goals in all three areas are achieved by containing the petroleum being transferred or stored. The industry lays no claim to perfection. But it has made remarkable progress in creating and employing preventive techniques and equipment–both in pipelines and in terminals. DEVELOPMENT OF THE 'NEXT GENERA TION' CHEMICAL DISPERSANTS,
Exxon Research and Engineering Co., Florha Park, N. J.
G. P. Canevari.
In: Prevention and Control of Oil Spill Proceedings of Joint Conference, Washingto DC, March 13-15, 1973. p 231-240, 10 fig, 15 ref.

Descriptors: *Oil spills, *Oil pollution, Water po lution, *Water quality control, Quality contro *Dispersion, Chemical reactions.
Identifiers: *Outer Continental Shelf, Chemic dispersants, Biological effects, Drop size.

Despite the limitations of the mixing energ requirement, significant use of chemical dispe sants continues where their use, due to condition such as inability to recover oil, is appropriate an in adherence to regulatory agencies. Also contin ing are extensive laboratory studies to resolve th biological effects, particularly long term, o dispersed oil. Biological field surveys of seven

ecent major applications indicated that there was ttle or no evidence of detrimental effects but ore studies of this type are needed. The capabili- of chemical dispersion, as an approach to han- le oil spills under those conditions where oil ecovery is not possible, will be increased by or- ers of magnitude by the elimination of mixing nergy. This is the indicated approach for the 'next eneration' dispersants. Technical feasibility for ese no or low mixing chemicals is shown. The asic differences between these systems and con- ention systems were identified. Based on the haracteristics of the dispersant systems under evelopment, e.g., submicron droplets, the en- ironmental impact of these much finer droplets epresent the remaining major considerations. NGINEERING STUDY OF AN OIL GELLA- ION TECHNIQUE TO CONTROL SPILLS ROM DISTRESSED TANKERS,
Exxon Research and Engineering Co., Florham ark, N. J.
. M. Goldstein, R. M. Koros, and B. L. Tarmy.
n: Prevention and Control of Oil Spills, roceedings of Joint Conference, Washington, DC larch 13-15, 1973. p 247-253, 6 fig, 17 ref.

Descriptors: *Oil spills, *Oil pollution, Water pol- ution, *Water quality control, *Pollution abate- ent, *Gels, *Rheology.
dentifiers: *Outer Continental Shelf, Gellation, Crude oil, Tankers, Engineering design.

Crude oil gellation is a potentially attractive echnique for minimizing or preventing the loss of il from a distressed tanker by converting the iquid oil into a rigid solid. The procedure involves he chemical reaction of two organic liquid gelling gents dissolved in the oil to form a gelant com- ound which entraps the oil. The resulting gel vould float as a coherent mass if it were extruded rom a ship or escape as a result of tanker break- p. This paper presents the results of a program ndertaken to demonstrate in situ gellation on a arge scale, and to gather engineering design infor- nation for this technique. Engineering design data athered include the effect of mixing energy, mix- ng time, gellation time and temperature on gel trength. In addition, rheological properties of the el were examined to relate gel strength to the naximum fluid static head that may be maintained vithout flow through a certain hull hole. Details of gellation test with 500 bbl of South Louisiana rude oil are discussed. This work forms the basis or the further efforts on equipment development, election and evaluation required before this echnique can be used in the field. (See also W76- 9312) (Sinha-OEIS)

BEHAVIORAL CHARACTERISTICS AND CLEANUP TECHNIQUES OF NORTH SLOPE CRUDE OIL IN AN ARCTIC WINTER EN- VIRONMENT,
Department of Transportation, Washington, D. C.; and Coast Guard, Washington, D. C.
T. J. McMinn, and P. Golden.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 263-276, 14 fig, 2 tab, 9 ref, 3 append.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Environmental effects, *Ice, Quality control, Gravity, Surfactants.
Identifiers: *Outer Continental Shelf, *Oil-ice interaction, North Slope, Arctic, Bering Sea, Dispersants, Sorbents.

This paper deals with the physical fate and behavior of crude oil when spilled on winter arctic ice and snow surfaces. The concepts and theories developed are a result of a series of experiments performed by Coast Guard personnel in the Alaskan arctic during January-February 1972. Spreading and aging of oil on ice and snow, the unique interaction phenomena of snow and crude oil, and effectiveness of various cleanup techniques attempted on crude spilled on snow and ice are considered. Oil spreading over ice and snow is largely unaffected by oil properties such as density, viscosity, and surface tension. Oil spreading rate is also believed not to be a function of ambient air temperatures. Terminal spreading limit, independent of oil properties, is a function of effective surface roughness and volume of oil spilled. Oil was found to age on arctic ice. The winter aging rate was found to be significant although reduced from summer aging rates. Migration of oil into the ice or snow surface is minimal. However, snow falling on the surface of a freshly spilled oil pool migrates into the oil forming a mixture that contains up to 80% snow (by volume). An array of sorbents, surfactants, and dispersants were tested with largely negative results. (See also W76-09312) (Sinha-OEIS)

DEVELOPMENT OF A POLYURETHANE FOAM MARINE OIL RECOVERY SYSTEM,
Shell Development Co., Houston, Tex. Pipeline Research and Development Lab.
J. P. Oxenham, R. A. Cochran, D. P. Hemphill, and J. P. Fraser.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 277-289, 20 fig, 6 tab, 4 ref.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Environmental effects, *Water quality control, Equipment.
Identifiers: *Outer Continental Shelf, Sorbents, Polyurethane foam, Oil booms, *Oil recovery.

A system has been developed for recovering spilled oil from water, under a wide variety of environmental conditions and for all types of oils, at rates up to 9,000 gal/hr. This system is based on the use of polyurethane foam, foamed on the job site, as a sorbent for the spilled oil. The foam is recirculated to increase efficiency and to lower unit costs. Equipment needed includes collection booms, an open-mesh chainlink belt for harvesting the oil-soaked sorbent, and a roller-wringer to remove oil and water from the foam. The foam is initially comminuted and distributed onto the water by means of a hay blower (mulcher), and recycled pneumatically or by mechanical conveyor. Recovered oil and water are transported to shore for further treatment prior to disposal. Used foal is disposed of by incineration. (See also W76-09312) (Sinha-OEIS)
W77-00231

DEVELOPMENT AND PRELIMINARY DESIGN OF A SORBENT OIL RECOVERY SYSTEM,
Hydronautics, Inc., Laurel, Md.
E. R. Miller, Jr.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 291-307, 18 fig, 7 tab, 1 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, Water treatment, Equipment, Design criteria.
Identifiers: *Outer Continental Shelf, Oil recovery, Sorbents.

The development and preliminary design of a sorbent oil recovery system was carried out under contract to the EPA. The system is based on the use of open-cell reticulated polyurethane foam sorbent material. This material may be regenerated for use in a continuous system by mechanical squeezing. The development program included studies of the sorbent performance, the broadcasting system, the harvesting conveyor, the sorbent regenerator and the recovery platform performance. The results of the development program showed that an oil recovery system based on the continuous reuse of the sorbent material is feasible. Based on the data developed, a preliminary design for a 3000 GPH recovery system for protected waters was prepared. (See also W76-09312) (Sinha-OEIS)

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control.
Identifiers: *Outer Continental Shelf, *Wave action, *Wind effects, Sorbents.

Analysis of the research results indicate that mechanical sorbent systems can be used efficiently and effectively to recover spilled oil. Recovery efficiencies better than 90% can be expected. Within design limitations, wave action will have little effect on oil-sorbent recovery. In practice, wave action actually increases oil removal rates by bringing the oil into more intimate contact with the sorbent. Wind will produce detrimental effects on the broadcasting unit operation. These effects can be minimized by proper field operating techniques. (See also W76-09312) (Sinha-OEIS)

NEW DEVICE FOR REMOVING OIL SLICKS FROM THE SURFACE OF WATER,
Battelle Inst., Geneva (Switzerland).
J. J. Asper, and P. Bolli.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 315-332, 29 fig, 2 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Equipment, Pollution abatement, *Patents, Separation techniques.
Identifiers: *Outer Continental Shelf, *Variable pitch screw, Oil slicks, *Oil recovery.

In an analytical study of devices designed to remove oil slicks floating on water, the conclusion

was that the majority of existing devices are not easily adaptable to marine operation. To overcome this disadvantage, Battelle has conceived a new device. The system is composed of a rotating, multi-thread screw in a casing. The oil and water enter the system at a given speed and are trapped between the threads. As the pitch of the threads progressively diminishes, the oil thickens and is removed by a pump from a chamber situated at the end of the screw, while the water is removed through an aperture below the screw casing. Disordered motion of the waves is absorbed by the last stage of the screw and the whole device follows the movement of the swell. This paper also describes the related laboratory development work and data on the performance of the device. The Patent Service of Battelle-Geneva has filed U.S. patent application No. 258.242 dated 31/5/72, relative to the invention which is the subject of this paper in the name of SEACLEAN S.A. Patents have also been applied for in most maritime countries, in most countries having lakes and large waterways, and in other industrialized countries. (See also W76-09312) (Sinha-OEIS)

FREE VORTEX RECOVERY OF FLOATING OIL,
Scientific Associates, Inc., Santa Monica, Calif.
E. B. Nebeker, S. E. Rodriguez, and P. G. Mikolaj.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 333-338, 5 fig, 1 tab, 9 ref. DOT-CG-22878-A.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control, *Water pollution, *Skimming, Prototype tests, Equipment.
Identifiers: *Outer Continental Shelf, Crude oil, Fuel oil, Free Vortex, Sorbents, Vortex skimmer, *Oil recovery.

A technique using a free vortex to recover oil from high sea, stream, and harbor waters is presented. An oil slick will be drawn into the center of the vortex due to water flow induced by an impeller and other rotating hardware. As a result, a significant 'captive radius' is demonstrated which draws in oil from appreciable distances from the device - useful around piers, ships, etc., in harbors. Upon approaching the vortex, the oil will submerge and accumulate within a center region of the vortex. This pocket will contain a concentrated mass of oil which can be removed by conventional pumping. Since oil collection is not directly performed by hardware, but rather by the induced vortex flow, essentially the same hardware was also used to collect sorbent materials of various sizes and shapes. Tests were performed with a free vortex oil recovery device having an impeller diameter of two feet. Performance data were obtained both under quiescent water conditions and also under environmental conditions that simulated a severe sea state four with 20 knot winds and two knot currents. Oil recovery rates and oil/water ratios are reported for oil film thickness ranging between 1/16 to one inch thick using No. 2 Fuel Oil, Heavy Crude Oil, and a Residual Fuel Oil. HIGH SEAS OIL RECOVERY SYSTEM,
Ocean Systems, Inc., Reston, Va.
F. A. March, and R. L. Beach.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 339-350, 10 fig, 7 ref.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control, Water pollution, *Prototype tests, Equipment weirs, Testing.
Identifiers: *Outer Continental Shelf, Pollution prevention, Scale models, Model tests, Oil booms, *Oil recovery.

A system for recovery of petroleum products from accidental offshore spills was developed and tested. The testing included both model testing and full scale testing of a 60 foot long system capable of recovering oil at a rate of 2,000 gal/min. The oil recovery rate is relatively independent of wind and wave conditions, surface temperature, oil specific gravity, oil-water interfacial tension and significant oil type variation. It is not affected by viscosity except for discharge hose pressure limitations above 10,000 SSU. The oil recovery system is air and truck transportable for rapid deployment to a remote spill location. It is completely self-contained having its own power unit, control system, and pumps. In its preferred deployment configuration it is used with oil containment booms for funneling the oil to the recovery system. A double weir system is employed to obtain the high performance of the system. The system is operated in such a way that oil thickens in front of the primary weir and then further thickens in front of the secondary weir, where it is withdrawn. Typically, the system concentrates free slicks from a thickness of 0.1 inches or less to a depth of approximately two feet in front of the secondary weir. The testing reported upon includes both model testing and full scale testing of the system. (See also W76-09312) (Sinha-OEIS)

OIL RECOVERY ON THE HIGH SEAS,
Coast Guard Research and Development Center, Groton, Conn.
J. T. Leigh.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 351-360, 3 fig, 9 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Water pollution, *Pollution abatement, *Prototype tests, *Environmental effects, Viscosity, Equipment.
Identifiers: *Outer Continental Shelf, Oil booms, *Oil recovery, Disc drum recovery system, Wave conforming weirbasin.

Two prototype oil recovery systems currently under construction are described. Design goals for the systems include air transportability, recovery of a complete range of oil types at 2000 gpm in a sea state 4, use with a Coast Guard developed boom and Coast Guard boats and ships. One system utilizes a rotating disc-drum for oil removal. The drum is mounted in a unique catamaran which utilizes inflatable pontoon hull sections. Oil recovery rate is dependent on viscosity, slick thickness, current and wave conditions. In all conditions efficiency is expected to approach 100 percent. The second system utilizes a wave conforming weirbasin. Oil recovery rate is primarily dependent on slick thickness and current. Efficiency is expected to approach 100 percent for all conditions. OIL SPILL CONTAINMENT SYSTEM DEVELOPMENT AND TESTING PROGRAM,
Coast Guard, Washington, D.C.
R. N. Abrahams, and E. R. Miller, Jr.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 361-374, 15 fig.

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control, *Water pollution, *Prototype tests, Barriers, Tests, Equipment.
Identifiers: *Outer Continental Shelf, *Oil slicks, *Containment barriers.

A prototype high seas oil containment barrier and interim air delivery system was constructed. Full size high seas field testing both with and without oil was conducted. A brief review of the containment barrier design features and development program is presented. A major part of the development program involved field testing. Th procedures and instrumentation used for the fiel tests are described. The results from the oil co tainment tests in calm water and waves ar presented in detail with qualitative and quantit tive data on oil loss mechanisms and rates. (Se also W76-05312) (Sinha-OEIS)

PHYSICAL REQUIREMENTS FOR OIL POLLU TION CONTROL BARRIERS,
Massachusetts Inst. of Tech. Cambridge. Dept. Ocean Engineering.
J. H. Milgram.
In: Prevention and Control of Oil Spill Proceedings of Joint Conference, Washingto DC, March 13-15, 1973. p 375-381, 6 fig, 4 ref.

Descriptors: *Oil spills, *Oil pollution, *Wat quality control, Water pollution, *Barrier *Pollution abatement, Equipment, Model studie Prototype tests.
Identifiers: *Outer Continental Shelf, Wave a tion, Wind effects.

An oil pollution control barrier must hav adequate strength to withstand wave and curre forces in the sea. In addition to this, it must b adequately strong to withstand nonoperating loa such as those encountered in constructio packaging, launching, recovery and refurbishme for further use. The barrier must have seakeepi responses which are correct for the purpose containing oil. Sway response of a barrier needed to avoid large relative flow velocities waves. Heavy response is needed so that the rel tive height of the oil on the barrier will not beco too large allowing oil to pass over the barrier become too low and allow oil to pass beneath th barrier. The roll angle of the barrier must be rel tively small to prevent leakage as well. The abo factors are considered in this paper. This co sideration is based on full scale trials of barrier theoretical studies and model tests. (See also W7 09312) (Sinha-OEIS)

MECHANICAL CONTROL OF OIL SPILL UTILIZING A STREAMLINED BOOM,
Ultrasystems, Inc., Newport Beach, Calif.
D. C. Wooten.
In: Prevention and Control of Oil Spill Proceedings of Joint Conference, Washingto DC, March 13-15, 1973. p 383-389, 6 fig, 1 tab, ref. EPA-68-01-0182.

Descriptors: *Oil spills, *Oil pollution, *Wat quality control, *Pollution abatement, *Model st dies, *Prototype tests, Equipment.
Identifiers: *Outer Continental Shelf, Bow wave *Oil booms, Wave action, Current action.

Conventional oil retention booms fail to contain in currents above one to two knots. A streamlin boom to operate in currents or while being tow in excess of two knots was designed and test under varying current and combined wave-curre conditions. The boom consists of airfoil-shap sections which resemble hydrofoils operating the water surface. The boom is designed so th the stagnation streamline at the leading edge of t foil is located beneath the oil spill under a range dynamic current and wave conditions. Motion the boom through the water (or the flow past t boom due to a net current) causes a bow wa which sweeps oil and water over the top of t leading edge of the boom and into a sump. Tes indicated that the streamlined boom profile has drag coefficient of less than one-third that of co ventional boom shapes. Collection efficiency me surements with oil indicate that collection efficie cies greater than 75% can be achieved at thr knots. (See also W76-09312) (Sinha-OEIS)

lentifiers: *Outer Continental Shelf, Bilge, Bal-st water.

he physical separation process of coalescence as been studied analytically under controlled con-tions in regard to the separation of oil from oily ater mixtures. Variations in coalescer per-rmance were studied as a function of the oily ater feed to a three stage prototype separation ystem of which coalescence was the final stage. he data were analyzed statistically and it was nown that increasing suspended solids concentra-on, increasing oil viscosity, and increasing oil oncentration decreased coalescer element fetime, however, above a certain level increasing l concentration had no effect. Variations in the tal flow rate in the range of one to four gallons er minute per square foot did not have a signifi-ant effect on coalescer element life. Under all onditions studied, the effluent water contained ss than 15 parts per million oil, only ten percent f the samples analyzed contained more than this mount. The results indicate that coalescence is seful as a final polishing step in an oil/water eparation system. (See also W76-09312) (Sinha-EIS)

VALUATION OF A UNIQUE CENTRIFUGE OR SEPARATION OF OIL FROM SHIP ISCHARGE WATER,
oster-Miller Associates, Inc., Waltham, Mass.
. C. Harvey, and V. K. Stokes.
: Prevention and Control of Oil Spills, roceedings of Joint Conference, Washington, C, March 13-15, 1973. p 391-402, 11 fig, 1 tab, 6 ef.

escriptors: *Oil spills, *Oil pollution, *Water uality control, Water pollution, *Pollution abate-ent, Discharge water, Equipment, Tests, Model tudies, Prototype tests, *Separation techniques.
lentifiers: *Outer Continental Shelf, Centrifuge, rude oils, Bilge, Ballast water, Drop size.

A centrifuge was conceived and tested especially or the separation of oil as it is usually dispersed in he bilge and ballast water of ships. The centrifuge s unusual in having predominantly axial flow al-owing comparatively high throughput and low peed. It has both primary and secondary stages of eparation incorporated into the design and is thus apable of operating with high input concentra-ons. The device was tested in the laboratory sing mixers in a storage tank and a centrifugal ump to disperse up to 8% oil in water. Effluent oncentrations in the range of 10 ppm were ob-ained with inputs containing 1000 ppm of No. 2, o. 4 and Nigerian Crude Oils. At higher concen-rations ranging up to 58,800 ppm for No. 2 oil and 8,900 for No. 4 oil the effluent contained less than 00 ppm. Centrifuge performance on No. 2 and o. 4 oils containing ten% Gamlen D was lower han with pure oils. Coalescence occurred but roduced drops smaller than with pure oils requir-g a modification to the separator design. The put and output oil droplet size distributions were easured using the Coulter particle counter. This ermitted an evaluation of separator performance s a function of the drop size content of the oil ispersion and a rational assessment of the design ethod and its application to the development of ture prototypes. IN-SITU MEASUREMENTS OF OIL BARRIER SHAPE AND LOADS DUE TO CURRENT ACTION,
Rhode Island Univ., Kingston. Dept. of Ocean Engineering.
G. A. Brown, S. Bartlett, and W. Lamb.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 409-419, 8 fig, 4 tab, 12 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Pollution abatement, *Barriers, Equipment, Environmental effects.
Identifiers: *Outer Continental Shelf, Moored barriers, *Oil barriers, Current action, Wave action, In-situ measurements, Wind effects.

In-situ measurements were made of oil barrier shape and loads created by current action. A commercial cylinder and skirt type barrier with a 100 foot length was used. The barrier was located in Narragansett Bay near the Jamestown Bridge so that the bridge could be used for certain measurements in this experimental program. The barrier shape was obtained by taking transit readings from the Jamestown Bridge on painted target areas located at various spots along the barrier's cylindrical floatation members. The barrier was instrumented with two recording load cells-one at each end of the barrier–and two accelerometers located near the mid-point of the barrier for obtaining vertical and horizontal accelerations. Direct current measurements were made in the vicinity of the barrier by the drifting drogue technique. Wave data were taken with a capacitance wave staff. Local wind speed and direction were noted aboard the accompanying research vessel. The shape, load and current data were used to calculate effective and base coefficients for the barrier. The observed shape was used with several drag coefficient calculations to calculate a predicted drag force on the barrier. The calculated results from these studies are in reasonable agreement with model barrier data taken in laboratory facilities. (See also W76-09312) (Sinha-OEIS)

DESIGN PARAMETER STUDY OF AN OIL-SPILL BOOM,
Exxon Production Research Co., Houston, Tex.
J. S. Chung, G. R. Cunningham, and J. M. Evon.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 427-439, 17 fig, 2 tab, 6 ref, append.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Pollution abatement, Water pollution, Equipment, *Design.
Identifiers: *Outer Continental Shelf, *Oil booms, Catamaran booms, Containment.

Oil-spill containment boom design involves a broad area of technology: air-oil-water flow in the presence of a moving barrier, wave mechanics, and motions of bodies acted on by winds, waves, and currents. Although many devices have been designed to control oil spills, systematic parametric studies and published engineering design data have been scarce. For this reason, we have studied fundamental design parameters and tested their application to boom design with models in towing tanks and a full-scale sea trial in the Santa Barbara Channel. This work has developed the proper relationships between the size and shape of boom modules and waves to (1) achieve in-phase motions, (2) determine the optimum net depth for a net-system boom, (3) reduce modular interaction and damage, (4) reduce boom tensions, and (5) determine boom strength requirements. All these are interrelated, but the various parameters are presented by categories. The tests results supporting these parameters are also presented. (See also W76-09312) (Sinha-OEIS)

OIL WATER SEPARATION BY ULTRAFILTRATION,
Abcor, Inc., Cambridge, Mass.
R. L. Goldsmith, and S. Hossain.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 441-456, 20 fig, 5 tab, 4 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Pollution abatement, *Oily water, *Oil wastes, Separation techniques, Membranes, Equipment, Membrane processes.
Identifiers: *Outer Continental Shelf, *Ultrafiltration, Ballast water, Bilge, Membrane ultrafiltration, Fuel oils, Crude oil, Ship discharges.

Ultrafiltration with one-inch diameter tubular membranes produced highly-purified water from oil emulsions. For kerosene, No. 6 Fuel oil, Venezuelan crude and lubricating oil at input ratios of 100 ppm to 90 percent, treated water was uniformly free of visible oil and had less than ten ppm oil. Ultrafiltration rate depended on oil type, input ratio and operating conditions. Typically, rates were high, but decreased with time due to membrane fouling. Factors which increased emulsion stability of decreased concentration polarization (e.g. high feed circulation rate) minimized fouling. Membrane cleanup was simple and effective, with no loss in long-term membrane capacity in over 3000 continuous test hours, with cleanup each 72 hours. Cost and physical requirements for systems of 10, 100, 1000, and 10,000 gpm were estimated for membranes in tubular and spiral would configurations. The latter, currently untested, is favored because of lower cost, weight, power, and space requirements. Field trials with actual oily wastes are recommended. (See also W76-09312) (Sinha-OEIS)

DROP SIZE DISTRIBUTIONS IN OIL WATER MIXTURES,
Foster-Miller Associates, Inc., Waltham, Mass.
V. K. Stokes, and A. C. Harvey.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 457-465, 9 fig, 2 tab, 9 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Oily water, *Separation techniques, Emulsions, Instrumentation, Tests.
Identifiers: *Outer Continental Shelf, Centrifuges, Drop size, Settling.

The oil drop size distribution in oil water mixtures is of importance in the design of separators that make use of settling or enhanced settling as in centrifuges. This paper describes an attempt to identify the parameters that affect the size distribution of drops in mechanically generated emulsions. Oil/water mixtures were made by three different methods. On the basis of the results of these tests, a standard procedure for making mixtures was adopted. The results of an extensive series of tests, with three different oils, in which the drop size distributions were measured by a Coulter Counter are presented. (See also W76-09312) (Sinha-OEIS)

LARGE-SCALE EXPERIMENTS ON THE SPREADING OF OIL AT SEA AND ITS DISAPPEARANCE BY NATURAL FACTORS,
Department of Trade and Industry, Stevenage, (England). Warren Spring Lab.
P. G. Jeffery.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 469-474, 6 fig, 1 tab, 5 ref.

Descriptors: *Oil spills, *Oil pollution, *Environmental effects, *Water quality control, Water pollution, Dispersion.
Identifiers: *Outer Continental Shelf, *Oil slicks, Sea state, Oil spreading, Crude oil.

Those considerations that are of importance in undertaking large-scale oil-spreading experiments are described. One such experiment involving a discharge of 120 tons of Iranian Light Crude Oil in the North Atlantic is described, and the spreading pattern observed is reported in detail. The observations continued over a period of four days, after which the bulk of the oil had disappeared by natural factors, leaving only a few patches of thicker oil, largely in the form of a water-in-oil emulsion, which was also rapidly disappearing. Blokker constants have been calculated for the observed spreading of the slick, and these are reasonably constant throughout the four-day period. (See also W76-09312) (Sinha-OEIS)

MEASUREMENT OF EVAPORATION RATES FROM OIL SLICKS ON THE OPEN SEA,
California Univ., Santa Barbara. Dept. of Chemical and Nuclear Engineering.
H. O. Sivadier, and P. G. Mikolaj.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 475-484, 9 fig, 3 tab, 14 ref.

Descriptors: *Oil spills, *Oil pollution, *Environmental effects, *Water quality control, Water pollution, *Pollution abatement, Gas chromatography, Evaporation, Seepage, Pollutant identification, Evaporation.
Identifiers: *Outer Continental Shelf, Petroleum, Evaporation rate, Oil slicks, Sea surface roughness, Sea state.

A gas chromatographic method of analysis, applicable for all types of petroleum products, has been developed to measure the time dependent extent of evaporation from an oil slick on the open sea. Laboratory calibration tests show the method to have an uncertainty in evaporative weight loss of less than 1 percent. The method has been tested in the Santa Barbara Channel using oil from natural seeps at Coat Oil Point. Under sea state four conditions, this oil lost most of its volatile components in one to two hours. The resulting oil slick residue became sufficiently dense that it could easily enter the water column where it would be subjected to subsurface transport mechanisms. Sea surface roughness was observed to have a significant effect on the rate of evaporation. (See also W76-09312) (Sinha-OEIS)

CLEANUP OF INLAND OIL SPILLS,
Esso Research Centre, Abingdon (England).
W. E. Betts.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 549-558, 16 fig, 4 ref, 3 append.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Water pollution, *Pollution abatement, Groundwater, Inland waterways, Equipment, Rivers, Lakes, Inland waterways.
Identifiers: *Cleanup methods, Fuel oil.

The requirements for dealing with accidental inland oil spills is outlined and the importance of using the optimum method of cleanup for each spill and the desirable features for cleanup equipment of efficiency, portability, low cost, ease of use, and versatility is emphasized. New devices are described and have been incorporated into a low-cost package of cleanup equipment. Examples of how a variety of spills have been successfully cleaned up include oil on a fast flowing stream, removal of accumulated oil in a port, oil on a covered drinking water reservoir and oil on rivers. Examples are also given of the method of handling underground pollution by hydraulic drive systems and by recovery from the groundwater for both shallow groundwaters up to 8m below the surface and deep drinking water bore holes. TWO TYPES OF OIL SPILLS IN SWEDISH INLAND WATERS--TESTS OF NEW MATERIALS, IDEAS AND METHODS,
Swedish State Railways, Stockholm.
A. Jerbo.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 559-567, 12 fig, 5 tab.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Water pollution, *Pollution abatement, Equipment, Inland waterways, Sediments, Rivers.
Identifiers: Oil booms, *Sweden.

In February 1972, 600 tons of diesel oil was spilled in a river in the northern part of Sweden. Downstream from the spill is a system of hydroelectric power stations, fisheries and freshwater-intakes. The restoration was divided into using standard methods and developing new methods and materials. Thus: a pontoon bridge was built across the river; from the bridge adsorption material, Saneringsull, was blown out over the floating oil; oil-contaminated ice and snow was burned together with Saneringsull; the adsorbed oil was allowed to be frozen in the ice; the ice containing oil and adsorption materials was lifted to an ice-tip, later on the ice was melted; oil on free water surface was adsorbed. The adsorption material was spread from aircraft and boats; later on the adsorption material was transported to the shore and burned in incinerators; in order to protect the downstream area three types of booms were designed, no conventional boom could ever be used; every week water-samples were taken and analysed; and testfishing was performed in May 1972. The amount of oil one mile downstream from the last boom was never higher than 1 PPM and the fish did not contain any phenols or oils. The oil content of the surface water in the spill area and 5 miles downstream was, after the clean up job, at about 3 PPM which is normal for rivers during the timber-floating period. TROPICAL STORM AGNES PENNSYLVANIA'S TORREY CANYON,
Environmental Protection Agency, Washington, D. C.
R. Kaiser, D. Jones, and H. Lamp'l.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 569-577, 7 fig.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Inland waterways, Water pollution, *Hurricanes, *Storms, *Pennsylvania, Equipment, Cleaning, Materials.
Identifiers: *Tropical Storm Agnes.

The 'Agnes Story' disaster as related to the largest inland oil spill experienced in the history of the U.S. and actions taken by EPA in coping with the problem are presented. The inland rivers of the Middle Atlantic area experienced spills of petroleum products ranging from over 3,000,000 gallons of No. 2 fuel oil, gasoline and kerosene from storage tanks in Big Flats/Elmira, N.Y. (just north of the Pennsylvania border) to 6,000,000-8,000,000 gallons of black, highly metallic waste oil and sludge from an oil reclamation plant on the Schuylkill River. The aftermath of this gigantic inland spill was oil and gasoline soaked fields, oil coated trees, farm houses, homes, factories, an airport and hundreds of stranded oil puddles, ponds and lagoons as the rivers receded to normal levels. Major spill effects and significant cleanup operations, problems encountered, and lessons learned are presented so that future responses can be better and more efficiently dealt with in an inland oil spill disaster comparable to the 'Agnes Oil Spill'. LAKE CHAMPLAIN: A CASE HISTORY OF THE CLEANUP OF NO. 6 FUEL THROUGH FIVE FEET OF SOLID ICE AT NEAR-ZERO TEMPERATURES,
Environmental Protection Agency, Edison, N. J. Region II.
H. Lamp'l.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 579-582, 5 fig.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Pollution abatement, *Ice, Lakes, Cleaning, Materials, Equipment, Treatment.
Identifiers: *Lake Champlain, Fuel oil, Solid ice.

The removal of 44,000 gallons of No. 6 fuel from Lake Champlain in March, 1971, while the lake was frozen to a depth of five feet in the area affected by the spill is reported. The circumstances of the spill, the location and the adverse weather conditions presented a unique challenge to cleanup personnel in their quest to remove thick, viscous oil from a frozen, high-amenity lake. When confronted with this major spill (as classified by the National Contingency Plan) the cleanup personnel had no precedence upon which

ase their plan of attack. Improvisation was the eynote of the whole operation during the 'life' of is spill. Many novel ideas and techniques were ilized, not only to remove the oil, but to contain from further pollution the waters of Lake Chamain. (See also W76-09312) (Sinha-OEIS)

lentifiers: Cleanup methods, Containment.

brief review of several spill cases that have ocrred in the Southeast in the recent past are resented. Each case describes a unique situationither in terms of containment, retention or moval methodology. At Athens, Georgia, a ipeline break caused the closure of the Athens ater Supply System for twenty-four hours. A ipeline break near Shepherdsville, Kentucky, rced some 16,000 gallons of crude oil into a subrface layer of gravel. Interception trenches were sed to tap the gravel layers and water was forced to the layer up the gradient in order to 'flush' the ystem. A vandalized storage tank adjacent to the ongaree River was emptied of 10,000 Bunker 'C' ear Columbia, South Carolina. Elaborate containent and recovery procedures were employed ownstream. The oil, however, disappeared--save r minor vegetation stain, and non reached the ecovery site. River velocity, wind speed, temerature of the water and turbidity are discussed s contributors to this phenomena. At Jackson, lississippi, a broken sludge pond dyke at a rilling operating dumped 40,000 gallons of 'oil ops' and brine into the Big Black River. Retenon on the surface was impossible because of the ght to ten knot river velocity. Light disposable rbing booms were used to recover an estimated 0% of the oil. Pictures and sketches are utilized to mphasize technical aspects of each situation. See also W76-09312) (Sinha-OEIS)

CASE STUDIES OF THE USN SUPERVISOR OF SALVAGE, SALVAGE RELATED OIL POLLUTION INCIDENTS,
Naval Ship Systems Command, Washington, D. C. Office of the Director of Ocean Engineering.
D. E. Irons.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 597-600, 3 fig.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Pollution abatement, Water pollution, Discharge(Water), Personnel training, Rivers, Harbors, Beaches, Islands.
Identifiers: *Outer Continental Shelf, Groundings, Collisions, Salvage.

The involvement of the U.S. Navy salvage forces in oil pollution control, prevention and cleanup of spills generated by ships damaged by fire, groundings, collisions and overboard discharge is described. The six cases discussed include oil pollution threats to a major river, a major harbor, a turtle sanctuary on an isolated western Pacific Island and the open ocean and the adjoining miles of beaches. Methods and equipments used to combat the spills are described in detail. The Navy salvage forces including world-wide pools and bases of back-up equipment are discussed. Training of Naval personnel in oil pollution abatement techniques and the use of the many and varied equipments and materials is described. The status of on-going research and development programs which provide improved methods and equipment to combat oil pollution is reported. (See also W76-09312) (Sinha-OEIS)

JET OIL RECOVERY DEVICE,
Griffiths (James) and Sons, Inc., Seattle, Wash.
J. K. Stewart.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 601-615, 23 fig.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Pollution abatement, *Separation techniques, Treatment, Equipment, Prototype tests, Tests, Surface tension, Jets.
Identifiers: *Outer Continental Shelf, Deepsea, *Jet oil recovery.

The jet oil recovery device described causes contact of jet water streams with the recovered oil and separates the fluids within it. This concept involves the utilization of the surface tension characteristic of oil along with the hydraulic jet action to lift floating oil over a non-adjustable weir. A low pressure stream of water will carry with it an almost equal volume of contacted oil, depending on the type of oil, depth, jet angularity and outlet submersion, and other variable criteria. This paper is descriptive and findings reflect actual physical construction and tests only.)See also W76-09312) (Sinha-OEIS)

CODES OF PRACTICE FOR DEALING WITH OIL SPILLS AT SEA AND ON SHORE: A EUROPEAN VIEW
Institute of Petroleum, London (England).
L. R. Beynon.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 617-626, 10 tab.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Pollution abatement, *Estuaries, Shores, Beaches, Absorption, Burning, Dispersion.
Identifiers: *Outer Continental Shelf, Crude oils, Fuel oil, Distillate fuels, Waxy oils, Bunker oil, Oil booms, Sinking, Pick-up.

Representatives of nine countries of Western Europe have been preparing codes of practice for dealing with oil spills at sea and those which have reached the shore. This paper describes the codes which have been produced. The codes set out the recommended methods, in order of priority, for six main 'location variables.' (1) Open or rough sea; (2) Open sea, close to shore; (3) Estuaries; (4) Sheltered, calm waters (including ports and harbors); (5) On shore; and (6) Ice conditions. The other main variables taken into accout are type and quantity of oil spilt. 'Oil type' has been subdivided into: (a) Crude oils which spread on contact with water; (b) Crude oils which have weathered on the sea; (c) Water-in-oil-emulsions; (d) Heavy fuel oils; (e) Distillate fuels; and (f) Waxy oils which tend to coagulate into lumps on contact with the sea. (See also W76-09312) (Sinha-OEIS)

QUANTITATIVE EVALUATION OF MECHANICAL OIL SPILL CLEANUP DEVICES,
Civil Engineering Lab. (Navy), Port Hueneme, Calif.
J. J. Der, and D. J. Graham.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 627-633, 3 fig, 5 tab, 3 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Pollution abatement, Equipment, Tests, Cleaning, Weirs.
Identifiers: *Outer Continental Shelf, Oleophilic disks, Oleophilic belts, Saucer weir, Sorbents, Vortex weirs.

A systematic quantitative method has been developed which can be used for preliminary screening and with the availability of more accurate performance data, used for final evaluation and selection of candidate oil removal devices. This method has been applied to various types of devices available commercially. Although the lack of precision in available performance data precludes selection between devices with close rating, an outstanding score of a device under the present method is an indication of its potential for further study or development. The result shows that for confined area operation inverted belts and a saucer weir with hydro-adjusting feature have high potential. A system based on the mechanized recovery of polyurethane foam rated high for the open area operation. The effectiveness indices for all of the open area devices considered fall in a narrow range, however, and final selection must be based on more accurate data from field and wave tank tests. (See also W76-09312) (Sinha-OEIS)
W77-00263

OIL/SORBENT HARVESTING SYSTEMS FOR USE ON VESSELS OF OPPORTUNITY,
Woodard-Clyde Consultants, San Francisco, Calif. Envicon Div.
J. D. Sartor, and C. Foget.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 635-641, 9 fig, 3 tab.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, Water pollution, *Pollution abatement, Harvesting, Oceans, California, Equipment, Material, Tests.
Identifiers: *Outer Continental Shelf, Vessels of opportunity, Sorbents, Wire mesh belts, Straw.

A system for harvesting mixtures of oil and sorbent materials, primarily straw, which could be utilized for the recovery of floating oil from water was developed for use on vessels of opportunity. The first phase of the program involved testing individual system components and operating parameters as to their effectiveness in picking up sorbents only under actual conditions in a salt-water slough. The second phase entailed evaluat-

ing those operating characteristics of the harvesting system components selected in the first phase using crude oil and various sorbents in a test tank. The test program entailed the installation of the complete system on a vessel of opportunity (an LCM), and demonstration of the ability of the system to operate under actual conditions. The system was evaluated both in the San Francisco Bay and off Coal Oil Point, Santa Barbara where sorbent materials were dispensed over natural oil slicks. The system was found to be very effective in recovering sorbents (straw and polyurethane foam) from the water surface. (See also W76-9312)

USE OF THE MASSACHUSETTS DIP OIL SKIMMER ON FREE SLICKS IN THE CASCO BAY (PORTLAND) SPILL,
JBF Scientific Corp., Burlington, Mass.
R. A. Bianchi, E. E. Johanson, and J. H. Farrell.
In: Prevention and Control of Oil Spills, Proceedings of Joint Conference, Washington, DC, March 13-15, 1973. p 643-655, 19 fig.

Descriptors: *Oil spills, *Oil pollution, Water pollution, *Water quality control, Pollution abatement, *Skimming, Cleaning, Harvesting, Beaches, Massachusetts.
Identifiers: Oil slicks, *Casco Bay(MA), Fuel oil, *Oil skimmers, Oil booms, Straw, Debris.

On July 22, 1972, the tanker Tamano, carrying a full load of No 6 fuel oil, sustained a ruptured tank and reportedly spilled on the order of 100,000 gallons of oil in Casco Bay. For two weeks following the accident, the Tamano was anchored and surrounded by containment booms while its cargo was off-loaded and cleanup operations were performed. This paper describes the role newly developed Dynamic Inclined Plane (DIP) Skimmer played in the cleanup operation and presents observations and evidence of the need for, and effectiveness of, a mobile skimmer in large spill situations. The role of support vessels in maintaining the skimming operation and handling the collected liquids and solids is examined. The effective use of skimmers is demonstrated over a wide range of environmental conditions and the full range of oil debris conditions from the newly spilled, relatively clean oil to the weathered straw-seaweed-debris-laden material that exists after several days. The oil skimmer was secured to the side of several different vessels and used in a sweeping mode to collect heavy weathered No. 6 oil, oily straw, oily seaweed, and debris. Several conditions are presented including harvesting of windrows of oil and debris, harvesting thick oil in a free slick (in seas several feet high), and harvesting both thick oil and sheen leaking from a boom. The effectiveness of these operations is explored in terms of both pickup and transfer. (See also W76-09312) (Sinha-OEIS)

THE PHYSICAL OCEANOGRAPHY AND WATER QUALITY OF NEW YORK HARBOR AND WESTERN LONG ISLAND SOUND,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
D. A. Jay, and M. J. Bowman.
Technical Report No. 23, Reference No. 75-7, December 1975. 75 p, 21 fig, 9 tab, 110 ref, 3 append.

Descriptors: *Oceanography, *Water quality, *Sewage effluents, New York, *Water pollution sources, *Estuarine environment, *Transport, Salinity, Pollutants, Nutrients, Water resources, Circulation, Path of pollutants.
Identifiers: *New York Harbor, *Long Island Sound, New York Bight, Physical oceanography.

The literature on the tides, currents, hydrography and hydrology of New York Harbor from 1843 to date is reviewed. Particular emphasis is placed on the relationship between water, salt and pollutant transport mechanisms in the East River, the Harbor and western Long Island Sound. An estuarine circulation in the Upper East River modifies the hydraulic regime and transports Upper East River surface water toward Long Island Sound. The observed distributions of nutrients and sewage effluents suggest that the estuarine and dispersive mechanisms in theEast River transport a considerable fraction of sewage emptied into the East River to the Sound, while the advective component is expected to transport effluents into New York Harbor. Transport of sewage pollutants from the East River is probably a major factor causing the observed violations of state and federal water quality standards in western Long Island Sound. It is concluded that the East River, particularly the upper section, is a very poor location to release sewage effluents. (NOAA)

A SYSTEMATIC PROCEDURE FOR TAXI AGRICULTURAL POLLUTION SOURCES,
Colorado State Univ., Fort Collins. Dept. Agricultural Engineering.
W. R. Walker.
Engineering Mechanics Section, Civil and E vironmental Technology Program, Natio Science Foundation, Washington D.C. 20550. O tober 1975, 98 p, 12 tab, 22 fig, 33 ref.

Descriptors: *Model studies, Agricultu *Pollution charges(Taxes), *Colorado Ri Basin, *Taxes, Tax rates, *Salini *Methodology, Water quality control, Water p lution sources.
Identifiers: *Diffuse agricultural pollution, Gra Valley(Colo).

A methodology for taxing diffuse agricultural p lution sources is presented which is based up deriving linkages between three economic hydrologic modeling systems. The procedure volves modeling the hydro-quality system in agricultural area in order to identify the speci processes causing water quality degradati Then, these results are linked through a pollut coefficient to an economic externalities mo describing the detriments incurred by downstre uses of water with poor quality characteristi And finally, an input-output model is develop from which input coefficients and business tipliers are calculated as a means of assessing local economic impact of alternative taxing p cies. The Grand Valley in Western Colorado taken as the case study for this project since i one of the more significant sources of salinity the Colorado River Basin. The analysis evalua the potential for taxing agricultural croplands the valley as a means of controlling salinity rela damages in the lower Colorado River Basin. F groups of taxing strategies are investigated: directly attributable detriments, (2) per equivalent salt loading, (3) salinity or pollut coefficients, and (4) values of gross revenue acre. A discussion of how each tax could be plied is presented. (Skogerboe-Colo St)

entifiers: Chemical recovery, Thermomechani-l pulping, Sulfite pulp mills, Newsprint mills.

egulations to limit the discharge of pollutants om Canada's pulp and paper mills were promul-ted in November, 1971. During 1969-1974, sig-ficant reductions in such discharges were hieved, even with the increased production. The ajority of mills are presently covered by com-iance programs, but further work must be done efore the minimum limits prescribed in the pulp d paper effluent regulations are achieved. Mills e encouraged to practice prevention rather than eatment. In the period 1969-1974, industry ex-enditures for abatement facilities amounted to 00,000,000. An additional $811,000,000 will be quired to achieve compliance in all mills. Ef-uent abatement at integrated newsprint/sulfite ills poses the most difficult problem. The instal-tion of abatement facilities, such as waste liquor covery furnaces and incinerators, may not be conomically feasible because of high capital osts. Alternative abatement measures, such as ological treatment, could involve high costs, as ell as increased energy requirements. One poten-al solution may involve consolidation of several nall mills into a larger operation, making liquor covery economically more attractive. Process anges, such as a switch to thermomechanical ulping, may be another solution. (Witt-IPC)

A BALANCED REGIONAL INPUT-OUTPUT MODEL FOR IDENTIFYING RESPONSIBILITY FOR POLLUTION CREATED BY INDUSTRIES WHICH SERVE NATIONAL MARKETS,
State Univ. of New York at Binghamton. School of Management.
M. Chatterji.
International Regional Science Review, Vol. 1, No. 1, p. 87-94, 1975. 7 ref.

Descriptors: *Pollutant identification, *Input-output analysis, *Cost allocation, Cost transfer, Mathematical models, Spatial distribution, Regional economies, Pollution abatement, Environment, Management.

A balanced input-output model is designed to identify regional responsibility for pollution generation and control based on classification of production of useful goods as either local, regional, or national. Eleven equations produce a regional and national linkage of the output of the regional goods in the region with national final demand, the final demand of the region for regional goods, and the tolerable level of pollution final demand. If there is some change in any of the above exogenous factors, then the change in the output of the regional goods in the region can be calculated. The last two equations can be used for policy decisions, e.g., suppose a power plant must be constructed in a specific region. Then the responsibility for the pollution associated with its operations can be assigned relative to the two exogenous factors--national final demand, and final demand in the region, but only after adjustment is made for the acceptable level of pollution in the specified region. Similarly, the responsibility for the pollution from journey-to-work transportation and other regional activities can be related to the demand of that region and of all others. This analysis can be extended to pricing and value added by production. (Auen-Wisconsin).

Descriptors: *Pollution taxes(Charges), *Efficiencies, *Equity, Economic impact, New York, *Political aspects, Legal aspects, Taxes, Legislation, Regulation.
Identifiers: *New York(NY).

The efficacy of pollution taxes as a pollution abatement tool is assessed, specifically in its application to New York City during the 1972 winter when it was faced with a shortage of low-sulfur content residual fuel oil. In order to minimize damage to the ambient environment yet avoid potential welfare loss, a general variance to the sulfur-content regulations was granted jointly with a surcharge. The implications of that approach are examined with the conclusion that the existence of a legally specified 'fairness principle' effectively prohibited the construction of an optimal effluent charge. It is also pointed out that a 'fairness' stipulation is the central feature of the Pure Air Tax Act of 1972. The economic character of the New York City effluent charge system is analyzed by a model and demonstrates that ethically satisfying restrictions effectively thwart efficiency properties of effluent charges since the marginal damage function depends on a variety of meteorological, topological, demographic, and other socioeconomic factors; thus the optimum user charge must vary within a given environmental management region in order to achieve the efficiency characteristics. The central point is that the restrictions mandated by the political-legal setting in New York City and the federal legislation refused to recognize these differences and hence fail in optimal resource allocation. Descriptors: *Mussels, *Water purification, *Sea water, *Oil pollution, Oil spills, Oil wates, Organic compounds.
Identifiers: *Mytilus-Edulis.

The influence of Mytilus edulis on purification of seawater of petroleum products was studied under experimental conditions and quantitative indices determined. In aquariums with M. edulis, water is purified twice as fast as in the control (without animals). About 7% of the initial amount of petroleum product remains in the aquariums 3 wk after M. edulis is put into it; 1.4% of these products is settled by hydrobionts onto the bottom of the vessels, 5.6% remains in the surface film and about 0.2% is dissolved in the water. An assumption is made that chemical oxidation of oil starts 3 wk after its introduction.–Copyright 1976, Biological Abstracts, Inc.

Pollutants often cross natural barriers or otherwise interact to exercise profound effects on the world environment. On the other hand, corrective action taken in one place may produce benefits in others as well. Fortunately, water pollution control and soil and water conservation require identical measures in most instances. The control of soil erosion, for example, though it cannot prevent the loss of some soluble compounds, does keep waterways free of sediments with their attached, insoluble pesticides and nutrients. And pollution control itself is a vital part of any water conservation project. (Skogerboe-Colo St)

Descriptors: Water resources, *Plannin *Methodology, Education, Design criteri Evaluation, *Simulation analysis.

Objectives were to: (1) develop a methodology f evaluating role-playing simulation games as trai ing devices for students and practitioners in e vironmental fields; (2) apply this methodology selected role-playing simulation games current employed or proposed for employment in t water resources fields; and (3) recommend crite for selection of simulation games for uses in t water resources fields. Each objective was su cessfully met, and a new methodology for t selection and evaluation of educational simulati games in the environmental fields was develope The methodology should be applicable to a wi range of educational simulation game, a facilitate the statement and clarification of instru tional objectives for these games. A comprehe sive analytical framework is provided for exam ing the major dimensions of a simulation ga which include the following: (1) instructional o jectives; (2) practical aspects; (3) design chara teristics; (4) degree of reality; and (5) degree complexity.

attempt is made to determine the efficacy of ng geographic impact areas as analytical sub-ups for the assessment of the impact of multi-rpose reservoir projects on target communities. e impact areas utilized are: the take area; the ow-the-dam area; the urban area; and, the ad-ent area. Each area is described in detail and ch is analyzed for differences in knowledge, evious experience, and perception of impact on nmunity and family. Data originated from uctured and open-ended interviews in Johnson unty, Kentucky. Information was collected dur-two field efforts, in February, 1974, and in Au-st 1974. Frequency of response and content alysis are the chief analytical devices. Descrip-ns of the life styles of each region indicated sig-icant differences exist between impact areas. In dition, findings concerning the key variables of owledge, previous experience, and perception impact support the efficacy of impact area anal-s. Different impact areas represent different entations to reservoir projects. These dif-ences must be considered for a better un-rstanding of the social impact of such reservoir ojects. ntifiers: Tampa Bay Region(FL), Planned Unit velopments(PUDs), Regionalism, Solar energy.

s 6 month study looked into factors which inish success of innovative public programs l inhibit private investment in helping to solve blic sector problems. It focused upon communi-ion and motivation of key decision makers in vate and public sectors in and around the npa Bay region. Examples of successful and ing projects were analyzed. Study concludes t success of innovative programs is inhibited by c of understanding of the overall effort and un-ar definitions of responsibility, lack of packag-individual innovations into decision alterna-s, lack of support for innovations, and lack of ut by end-product users. Examples of each of se are given including regional development ef-s, solar energy projects, planned unit develop-nts, and legislation efforts. An experiment with goal of promotion of innovation in the public tor is described. A statewide program, velopments of Regional Impact, has been chosen because of its spatial and temporal characteristics. Major organizational elements of the experiment are a joint public-private sector committee to improve evaluation methods, an office of experiment management charged with technical control of the entire experiment, and introduction of certain brokerage functions. A successful brokerage undertaking would involve bringing together appropriate technology, planning and defining responsibilities of key people, supporting available innovation, and communicating meaningful information. Results of the experiment may provide useful information for policy guidance in areas of land use planning, environmental protection, revenue sharing, comprehensive planning and regionalism, and Federal-State relationships. Identifiers: *Impact assessment.

Methodological approaches to social impact assessment of water resources projects are discussed. A framework is set forth to carry out such analysis without prescribing rigid formulas. Topics such as the types of social scientists needed to carry out an assessment, useful theories the general orientation of water resources development, are discussed in sufficient detail to give a good start in doing an impact assessment. Four major areas are discussed: Human Community, Methods, Assessment and Evaluation, and Management Considerations. In Human Community, the range of problems encountered when trying to translate the real world into theories, models and paradigms is discussed. Data are difficult to obtain; simplifying assumptions are needed; and models are difficult to validate. In order to carry out assessment a policy and a framework are needed. This can be generated by answering questions such as: What goal values are to be sought.; What are the trends in the realization of water resources values.; and What broad physical and non-physical factors condition such trends. The Methods chapter gives information on social science methodology, data gathering and sources, data organization, and forecasting. Assessment, as distinct from impact analysis, must include someone's evaluation of perceived effects, or alternative actions, and of options expressed in diversified scenarios. As such, evaluative methods must deal with multiple objectives, provide flexibility, and include both monetary and non-monetary aspects for each alternative. A summary lists recommendations, including a series of pilot sites, a state-of-the-art study in specific situations, and a long range research plan. (Smith-North Carolina)

Colorado Environmental Resources Center, Fort Collins, Completion Report Series No. 74, October 1976. 51 p, 5 fig, 8 tab, 24 ref. OWRT A-022-COLO(1).

Descriptors: *Long-term planning, *Cost analysis, Statistical methods, Construction costs, Risks, *Economies of scale, Water supply development, Technology.
Identifiers: *Technological change, Geologic reconnaissance, Cost overruns, Optimal scheduling.

The major part of the investigation derives trends of real unit costs associated with major sub-project tasks of large-scale water projects. Data from U.S. Bureau of Reclamation water supply projects from 1935 to 1970 show that real unit costs of large-scale excavation and other construction operations have declined significantly, but the separation of static scale economy effects from the effects of true technological change poses a difficult problem. A second analysis examines how technological advances may contribute to the reduction of physical and engineering uncertainties in project construction and operation. A specific instance is geologic reconnaissance activities used in water project implementation, an activity which has benefitted from great technological advance in the post-war period. Data from U.S. Bureau of Reclamation projects show that there exists a statistically significant negative relationship between expenditures on reconnaissance investigations and geologically related construction cost overruns and post construction failures. The returns to geologic reconnaissance appear to have improved over time, suggesting significant technological improvement. Lastly, a dynamic investment planning model was utilized to determine the impact which inclusion of technological change as manifested in rates of change of the costs of various technologies would have on an optimal scheduling of projects in water supply system development. The results indicate that while some of the low historical rates of real cost reduction have been too low to affect the optimum sequencing of projects, rates well under 1% per annum can significantly change the optimum sequence of projects and the present value of system net benefits.

A CASE STUDY OF CITIZEN PARTICIPATION IN RESOURCE PLANNING: THE CRAWFORD COUNTY CRITICAL RESOURCE INFORMATION WORKSHOP.
Wisconsin Univ., Madison. Inst. for Environmental Studies.

IES Report 44, January 1975. 61 p. 12 fig., 4 tab., 8 ref.

Descriptors: *Census, *Social participation, *Natural resources, Planning, Methodology, *Wisconsin, Agriculture, Forests, Wildlife, Wetlands, Grasslands, Land use, Geology, Social aspects, History, Scenery, Minerology, Water resources.
Identifiers: Critical Resource Information Program, Crawford County(Wis), Delbecq Nominal Group Technique, Delphi method.

The Critical Resource Information Program (CRIP), intended to define and inventory the critical resources of the state of Wisconsin, was tested in Crawford County. CRIP offers a means of identifying, locating, and assessing the high quality resources in the state, though it will not provide a complete resource inventory. Ten resource categories were chosen for investigation: minerals; special geologic features; agricultural land; water; cultural, historical, architectural or archeological features; forests; wildlife; scenic areas; wetlands; and grasslands. One of the major needs of CRIP is to obtain local perspectives of these resources. This was accomplished in Crawford County through the use of the Delbecq Nominal Group Technique, a combination of the Delphi and brainstorming methods. Approximately 45 participants were chosen by University Extension agents and key resources personnel in the County to work in small workshops on each of the resource categories. Resource areas were identified and weighed. The findings are reported and an independent assessment of potentially critical areas is included for those resource categories (agricultural lands, minerals, and wildlife) where generally available data make it possible. A set of detailed maps were prepared based on the discussions, and given to the County Board. (Luedtke-Wisconsin)

Identifiers: Correlative water rights.

Significant property rights questions with respect to water are discussed from an economic perspective. The major problem considered is the efficient use of water, which is dependent upon the water allocation or transfer mechanism. This mechanism effects the quantity and mix of goods and services produced by a society as well as the distribution of wealth. It should allocate water resources between alternative users and over time in such a way that an equal value is obtained from the marginal units of all uses. Riparian, appropriative, correlative, pueblo, public ownership, and usufructuary water rights systems relevent to water allocation and use are discussed. Existing water law allocation/transfer criteria include: beneficial use; use preference; temporal priority; non-regulated uses over regulated uses; pre-permit uses over permit uses; priority with respect to source of water; priority of minimum or base flows over permit uses; economic consumptive use over physical consumptive use; and no injury proviso. Alternative approaches, including both planned and unplanned change, are set out along with some elements of the costs and benefits of achieving these respective changes. (Luedtke-Wisconsin).

FISHERIES MANAGEMENT AND SOCIAL CONTEXT: THE CASE OF THE MAINE LOBSTER FISHERY,
National Marine Fisheries Service, Washington, D. C. Fisheries Management Div.
J. M. Acheson.
Transactions of the American Fisheries Society, Vol. 104, No. 4, p. 653-668, 1975. 13 ref.

Descriptors: *Fish management, *Social aspects, *Institutional constraints, Attitudes, Lobsters, Political aspects, *Maine, Legislation, *Marine fisheries, Social aspects.
Identifiers: Cultural aspects.

The necessity for considering basic social and cultural aspects of fishing communities along with the fisheries resource itself in promoting fisheries management schemes is argued. Forty-eight Maine lobster fishermen were interviewed to discover what types of biologically viable management strategies would solve their over-fishing problems and would be acceptable to the fishing industry. Five kinds of management proposals designed to decrease fishing effort are discussed against the background of certain key institutional features of these coastal communities. Social and cultural features examined include the idea of territoriality, the harbor gang or social reference group, the emphasis on fairness and equal use of resources, and the dislike of part-time fishermen. Results suggest that attempts to decrease fishing effort by a moratorium on fishing, by taxation, or by biological controls such as raising the legal carapace size, would be strongly resisted. On the other hand, a trap limit and a limited entry licensing scheme would be consistant enough with some institutional features, such as territoriality, that they would receive considerable political support. In general, they tend to favor legislation that will either increase or not effect their income, or that formalizes cultural institutions already in existence. (Luedtke-Wisconsin)

Descriptors: *Recreation, *Sites, *Attitu *Evaluation, Methodology, Photography, *Sc Carolina, *Recreation facilities, Social aspects.

In an attempt to evolve a labor and cost sa method of determining recreational preferences, color slides were presented to groups of resource-oriented students at Clem University, South Carolina. Each group visited and evaluated the respective sites pr ously. The preference of a site when viewed slides differed significantly from preference on actual viewing of the site. The sites were r differently by the five student groups resulting significant student section-by-site interaction. study was initiated on the assumption that the of panoramic color slides would be a real method of determining preferences of large n bers of students in a short period of time. H ever, when compared to on-site viewing, method of presentation indicated that it was n reliable means of determining preferences. E though the students will be resource managers were therefore more homogeneous than a sa of the total population all groups did not score sites the same. Consequently, determining the preference of a heterogeneous cross section o general population by photographic meth would be unrealistic. (Auen-Wisconsin)

BLUE GOLD: MARICULTURE OF THE EDIBLE BLUE MUSSEL (MYTILUS EDULIS),
Harvard Univ., Cambridge, Mass. Administrative Services.
C. G. Hurlburt, and S. W. Hurlburt.
Marine Fisheries Review, Vol. 37, No. 10, p. 10-18, 1975.

Descriptors: *Aquiculture, *Shellfish farming, *Mussels, Europe, Coasts, Economic feasibility, Growth rates, United States, Methodology, Byproducts, Marketing.
Identifiers: *Mytilus edulis, France, Netherlands, Spain, Mussel mariculture, Depuration.

The high nutritional value and the feasibility of mussel (Mytilus edulis) mariculture is discussed. In Europe mussels are grown in different ways depending on the coastal geography and heights of tides. In northwest Spain, ropes are attached to rafts and extend about 30 feet down. Young seed mussels are collected and wrapped on the ropes until they become attached. They require 12-18 months to mature. An acre produces over 250,000 pounds of meat annually. A pole or 'bouchet' method is used along the Atlantic coast of France. Growth requires 12-18 months. An acre will yield over 4000 pounds of meat annually. In the Netherlands mussels are grown on the bottom of shallow, enclosed seas, but harvesting, cleaning, and storage is mechanized. About 20 months is required for their growth. An improved mechanized method for cleaning and storage is being developed in the Netherlands. Over 15,000 pounds of meat per acre are produced annually. Mussel culture can easily be adapted to the United States, depending on geographic and tidal conditions. Cubic, submerged growth, as in Spain, gives the best yields. Mussels are a very efficient producers of edible flesh. It could be the cheapest, most nutritious, and most abundant meat supply in the world. (Buchanan-Davidson--Wisconsin).

FORECASTS OF ATLANTIC AND GULF MENHADEN CATCHES BASED ON THE HISTORICAL RELATION OF CATCH AND FISHING EFFORT,
National Marine Fisheries Service, Beaufort, N. C. Atlantic Estuarine Fisheries Center.
W. E. Schaaf, J. E. Sykes, and R. B. Chapoton.
Marine Fisheries Review, Vol. 37, No. 10, p. 5-9, 1975. 1 fig., 2 tab., 18 ref.

Descriptors: *Forecasting, *Marine fisheries, *Fish harvest, *Atlantic menhaden, Fishing, Gulf of Mexico, Atlantic Ocean, Mathematical models.
Identifiers: *Gulf menhaden.

A multiple regression equation employing the empirical relation between catch and fishing effort estimates the annual catch. The total catch was used because (1) for the Atlantic fishery it is difficult to prorate effort on different ages, and (2) for the Gulf, aging is more uncertain; but there are fewer age classes in the fishery. The multiple regression used accounted for 85% of the variance in the Atlantic catches and 86% in Gulf catches. Observed Atlantic catches deviated from the forecasts by 9% in 1973 and 22% in 1974. The errors for the Gulf were 2% in 1973 and 1% in 1974. A measure of the incoming year class would permit development of short-term fishing strategies to take advantage of exceptional year classes or to prevent overexploitation of weak year classes. The model represents a progress report as other models, including more variables, are being considered. (Auen-Wisconsin)

STATUS OF THE GULF AND ATLANTIC MANHADEN FISHERIES AND IMPLICATIONS FOR RESOURCE MANAGEMENT,
National Marine Fisheries Service, Beaufort, N. C. Atlantic Estuarine Fisheries Center.
W. B. Schaff.
Marine Fisheries Review, Vol. 37, No. 9, p. 1-9, 1975. 5 fig., 3 ref.

Descriptors: *Marine fisheries, *Atlantic manhaden, *Fish management, Planning, Fish harvest, Fishing, Fish populations, Regulation, Commercial fishing, Model studies, Return(Monetary), Gulf of Mexico, Atlantic Ocean.
Identifiers: *Gulf menhaden.

The knowledge of the Atlantic and Gulf menhaden fisheries is summarized together with their problems. Some tentative solutions are offered and those problem areas which preclude an optimal management plan are indicated. The thrust of the discussion is toward the biological aspect of the resource and its response to harvesting at various intensity levels, as related to the total yield and the yield per unit of fishing effort. While catch limitations are the easiest to implement and will achieve the maximum sustainable yield (MSY), from the economic rationale it is necessary to limit the amount of effort and to do so in a manner that does not deter harvesting efficiency. In view of the technical difficulties of implementing any management scheme, the policy difficulties in determining an optimum strategy, and the inherent volatility of many fisheries, the option is to attain minimal objectives with a quota system as an initial step. Setting annual quotas, with adjustments in response to fluctuations in the size of incoming classes, would allow the industry to approach the peak of production systematically and gradually. Effort would be closely monitored each year to help determine the validity of the estimated MSY. This first management step would prevent both overfishing and economic difficulties for the industry, while other management plans are optimized. (Auen-Wisconsin)

MANAGEMENT OF THE OCEAN'S LIVING RESOURCES: AN ESSAY REVIEW,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
D. L. Alverson.
Ocean Development and International Law Journal, Vol. 3, No. 2, p. 99-125, 1975. 15 ref.

Descriptors: *Law of the Sea, *Marine fisheries, Resource allocation, Law enforcement, *Oceans, Jurisdiction, International waters, Institutions, Governments, *Management, Legal aspects, Political aspects, Fish harvest, Optimization.

A series of Resources for the Future (RFF) and American Society of International Law (ASIL) publications are reviewed to provide an overview and perspective on the management of the ocean's living resources in connection with the Third United Nations Conference on Law of the Sea. The six RFF papers are all oriented toward the theme of alternative arrangements for managing marine fisheries, while the ASIL report proposes eight principles as a rational basis for constructing a new international fisheries regime. Problems discussed are grouped under four areas: technical, legal and institutional, enforcement, and conference-associated. Technical problems considered are the (1) mobility of fisheries resources, (2) dynamic nature of marine fisheries resources, (3) ecological and harvesting gear interactions, (4) cost and difficulty acquiring credible biological and statistical information, and (5) communication failures between technical disciplines and between the scientific community and decision makers. Legal and institutional problems considered are: (1) No satisfactory right of property, (2) the distribution of wealth, (3) settlement of international dispute mechanisms, (4) the limited authority vested in management institutions, and (5) the rapid rate of change in modern fisheries. Proposed alternatives and recommendations are summarized and evaluated. (Luedtke-Wisconsin)

IOWA'S EXPERIENCE WITH A MANDATORY SEDIMENT CONTROL LAW,
Iowa Dept. of Soil Conservation, Des Moines.
W. H. Greiner.
Journal of Soil and Water Conservation, Vol. 30, No. 3, May-June 1975. p 132-134.

Descriptors: *Sediment control, *Sediments, *Legislation, *Iowa, Erosion, Erosion control, Soil erosion, Water quality control.
Identifiers: *Sediment control laws.

Before the mid-1960s, sediment control laws w seldom discussed in Iowa, but a chain of eve took place that brought these words i prominence. Iowa was one of the first states enact a sediment control law. Many people refe the law as landmark legislation because no o state has a law that deals with soil erosion to extent this one does. The law surely has had an pact on conservation district programs in Io but it is in no sense a model law. Compromi preceded its enactment. As a result, some secti of the law are not as strong as they could (Skogerboe-Colo St)

AN OVERVIEW OF THE IMPACT STUDY THE MCCLELLAN-KERR MULTIPLE P POSE ARKANSAS RIVER SYSTEM,
Institute for Water Resources (Army), Belvoir, Va.
L. G. Antle.
Available from the National Technical Info tion Service, Springfield, Va 22161 as AD/A 975, Price codes: A03 in paper copy, A0 microfiche. IWR Research Report 76-R3. 1975. 35 p, 3 fig, 1 plate, 5 tab, append.

Descriptors: *Watershed management, * systems, *Cost-benefit analysis, *Decision ing, Navigation, Flood protection, Recrea Water supply, Sediment control, Hydroele power, *Multiple-purpose reservoirs, Mul purpose projects, Arkansas, Oklahoma.
Identifiers: *Arkansas River(AR-OK), *Impa sessment, Socioeconomic development, Publ volvement.

Interim conclusions are discussed on the im of the completed McClellan-Kerr Arkansas R Project in Arkansas and Oklahoma. In the ports completed to date, the approach to in

analysis was to begin with physical changes in the river regimen introduced by the project, determine the uses made by people of the changes, trace the changes through higher order impacts, and then weigh these impacts by the values placed on them from a number of perspectives. The 4 completed reports concern: project use, socioeconomic profiles, commodity shipments on the Arkansas River system, and port development. Interim conclusions indicate that impacts were not anticipated and the more significant impacts become obvious only after careful study. During the first year of operation of the system, benefits of users approached costs, but the mix of benefits is quite different than anticipated. Navigation benefits are substantial and probably will exceed forecasts within 10 years. Power benefits are lower, but recreation benefits are significantly higher than predicted. Because of regional differences, benefits and costs are not perceived evenly, and development has occurred differently because of this. In Arkansas, industrial development is proceeding well. Of particular interest is the decision-making process which was followed in developing the implemented plan. There was a persistent conflict between regional and national goals, and the failure to develop considerable waterfront property is seen to have been caused by a lack of follow-through. An appendix focuses on some benefits: navigation, hydroelectric, recreation, sediment control, transportation. (Smith-North Carolina)

ENVIRONMENTAL EFFECTS OF ALTERNATIVE ENERGY DEVELOPMENTS IN THE NORTHERN GREAT PLAINS,
United Nations, New York.
R. A. Luken, and E. H. Pechan.
Computers and Operations Research, Vol 3, No 2/3, p 259-268, August 1976. 3 fig, 7 tab, 19 ref.

Descriptors: *Environmental effects, *Energy, *Model studies, Water, Air, Pollution abatement, Control, Technology, Estimating, Economics, Operations research.
Identifiers: *Northern Great Plains, Residuals.

A model used to characterize environmental conditions in the five-state northern Great Plains region is described. The current conditions and the expected conditions resulting from the development of the region's energy resources are compared with a focus on residuals emitted into the air and water and their relation to other parameters which describe the region. The model relates the levels of current and future economic and demographic activities to the quantities of residuals discharged into the environment. These quantities can be adjusted based on control technology used. Various scenarios of energy resource (primarily coal) development in the region are investigated and comparisons are made between (1) current activity levels and current controls, (2) current activity levels and expected controls, and (3) various future activity levels and future controls. Key residuals studied are particulates, sulfur oxides, biological oxygen demand, and suspended solids. Results of the analysis can be used to evaluate development policies. The various development alternatives can be compared with the present (base) case, and the future case, with no additional energy resource development. (Bell-Cornell)

A COMPUTERIZED SYSTEM FOR WILD LAND USE PLANNING AND ENVIRONMENTAL IMPACT ASSESSMENT,
Washington Univ., Seattle. Coll. of Forest Resources.
G. F. Schreuder, K. P. Rustagi, and B. B. Bare.
Computers and Operations Research, Vol. 3, No. 2/3, p 217-228, August 1976. 2 fig, 2 ref.

Descriptors: *Land use, *Assessment, *Simulation analysis, *Environment, *Computer models, Data storage and retrieval, Decision making, Management, Hydrologic aspects, Forest management, Recreation, Fish, Wildlife, Operations research.
Identifiers: *Wild lands, Timber production, *Environmental impact.

A computerized system useful for examining the physical, economic, and environmental consequences of alternative wild land use decisions is described. The system consists of a set of simulation models linked to a geographic data base by an information storage and retrieval subsystem. The simulation models cover forest production, timber harvesting, recreation, fish-wildlife-insect dynamics, and atmospheric and hydrologic processes. System inputs consist of land-use and management decision alternatives. The consequences of these system inputs can be evaluated at varying scales of spatial and temporal resolutions in terms of goods, services, and environmental impacts. Uses to data suggest that the system is a valuable aid to land-use planners and forest management decision makers. (Bell-Cornell)

BALANCING ENVIRONMENTAL QUALITY, ENERGY USE, AND GROWTH: DIFFICULT DECISIONS,
Energy Reserach and Development Administration-Fossil Energy, Washington, D. C.
F. H. Abel.
American Journal of Agricultural Economics, Vol. 57, No. 5, p. 815-818, 1975. 8 ref.

Descriptors: *Energy, *Simulation analysis, *Econometrics, Social aspects, Evaluation, Environment, Welfare(Economics), Cost-benefit analysis, Gross National Product, Decision making, Marginal costs, Marginal benefits, Water pollution effects, Air pollution effects, Model studies.
Identifiers: *Environmental quality, Quality of life, Economic growth, Energy self-sufficiency, Strategic Environmental Assessment System, Chase econometric model, Almond interindustry model.

The relationships between three major issues, environmental quality, economic growth, and energy self-sufficiency are examined. It is concluded that an adequate framework for analyzing the trade-off between these issues does not exist, and a single quality of life function cannot be estimated. The most realistic method of analysis is a trade-off analysis where the level of all major factors are estimated for each policy option, but this leaves the decision maker with the task of comparing noncommensurables. The Strategic Environmental Assessment System (SEAS) developed by EPA is a promising method of predicting this trade-off. Beginning with the Almond Interindustry Model, the system combines fourteen computer models. Economic growth rates, productivity, aggregate demand, and rates of substitution of new cleaner technology for old are inputs, and energy consumption, emissions of forty pollutants, GNP, Unemployment, output, transportation, and investment in plant and equipment are outputs. Some progress is reported in quantifying environmental factors. The best economic measure of changes in environmental quality is suggested to be the estimated damages caused by pollution. Here, imprecise national cost-benefit analysis can be performed, and improved techniques can lead to estimates of marginal costs and benefits needed in trade-off analysis. (Luedtke-Wisconsin)

CONCEPTUAL FRAMEWORK OF ENVIRONMENTAL MANAGEMENT,
Cleveland Dept. of Public Utilities, Ohio. Div. of Utilities Engineering.
A. B. Garlauskas.
Journal of Environmental Management, Vol. 3, No. 3, p. 185-203, 1975. 3 fig., 1 tab., 32 ref.

Descriptors: *Decision making, *Systems analysis, Management, Environment, Environmental control, Methodology, Ecosystems, Comprehensive planning.
Identifiers: *Environmental management.

The conceptual framework of environmental management, defined as a systematic and scientific approach to assuring a congruous interface between natural and man-made systems, is explored. Based on an ecosystems/biological sciences perspective the functional premises of environmental management are (1) to prevent irreversible changes in ecology, (2) to assure man's survival and the progressive improvement in his quality of life, and (3) to direct man's processes as parts of evolving nature as opposed to intrusions upon it. Conflicts which arise from the interaction of artificial and natural systems are resolved through the use of these premises. Functionally this can only be accomplished through multidisciplinary knowledge and interdisciplinary approaches. A simplified two-dimensional linear analysis is used to reveal the stress/anti-stress pattern of adjustment of the man-environmental equilibrium. Management of these stresses requires a systems perspective utilizing systems approach, system analysis, and systems management techniques. These concepts and techniques are used to integrate and balance the components of the environmental management framework: Environment, Disruptions, Effects, (Human) Ecosystem, Engineering and Technology and Legal Controls. The practical application of this methodology at the macro-scale level is beyond present capabilities, but the approach can be sealed down and used at the meso- and micro-scale levels. ECONOMIC IMPACTS OF STATE ENVIRONMENTAL PROGRAMS IN A NATIONAL FRAMEWORK: THE IOWA CONSERVANCY LAW,
Iowa State Univ., Ames. Center for Agricultural and Rural Development.
E. O. Heady, and V. S. S. V. Nagadevara.
Journal of Soil and Water Conservation, Vol. 30, No. 6, p 272-278, November-December, 1975. 3 fig, 5 tab, 8 ref.

Descriptors: *Legislation, *Iowa, *Sediments, *Erosion, Economics, Economic justification, *Economic impact.
Identifiers: Sediment damages.

Several states have passed laws to protect prime farm land, reduce environmental impacts, or eliminate off-site sediment damages. The 1971 Iowa legislature, for example, passed the Conservancy District Act to control the use of soil and water resources and thereby limit annual soil loss. Because of the inelastic demands for farm commodities, one state such as Iowa may restrain land use with the result that its farmers sacrifice income while farmers elsewhere gain income. National models were applied to determine what the outcome would be if Iowa were to fully implement its Conservancy District Act or apply other environmental restraints, such as limiting nitrogen and pesticide use. The results show that in all cases restraints implemented solely in Iowa would reduce net farm income in the state while income elsewhere in the nation would increase. Hence, national as opposed to state legislation is implied for the long run. (Skogerboe-Colo St)

Identifiers: *Stream channelization, *Hurricane Agnes, Watershed characteristics, *Environment impact studies.

Geologic, engineering, and biological investigations of six Pennsylvania coldwater streams were undertaken to determine the impact of channel modifications instituted both prior to and following Hurricane Agnes. The primary focus of the study was on the ecological changes brought about by stream channelization. No long-term deleterious effects on water quality, attached algae, benthic fauna, or forage fish populations were found. Trout, however, were found to be greater in number and weight in natural than in channelized stream reaches. Lack of suitable physical habitat appeared to be the primary cause of reduced trout populations in stream reaches which have been channelized. (Lee-ISWS)
W77-00375

THE INTEGRATION OF ENVIRONMENTAL AND DEVELOPMENT PLANNING FOR ECOLOGICAL CRISIS AREAS IN AFRICA,
Nairobi Univ. (Kenya). Dept. of Geography.
S. H. Ominde.
International Social Science Journal, Vol. 27, No. 3, p. 499-516, 1975. 6 tab., 23 ref.

Descriptors: *Planning, *Africa, Resources development, Human population, Urbanization, Rural areas, Industrial production, Regional development, Environmental effects, Social aspects, Management, Foreign countries, Cities, Migration.
Identifiers: *Developing countries, Environmental quality.

The conceptual framework of development planning and environmental conservation, demographic components, urban and rural environmental management problems, and the basic strategies of integrated development planning in Africa are examined. In developing countries, the planner must control environmental problems resulting from poverty, while at the same time adopt measures to prevent economic growth and industrial development from having an unfavorable impact on the society. Falling mortality rates, rising life-expectancy and sustained high birth rates are responsible for the 59% demographic inflation in Africa between 1950 and 1970. Tied to this increase are an accelerating rate of urbanization and the emergence of very large cities. Population growth, however, is only one factor in development problems, not the main cause. Rural development plans must give priority to a regional development concept which promotes a better balance in settlement patterns, a more rational use of resources including the adoption of new technologies, and encourages local participation. Urban development, on the other hand, must be examined with reference to the policy areas of: alternative settlement patterns and city size; strategy for the internal organization of cities; location policies; and strategies for the development of viable growth goals. (Luedtke-Wisconsin).
W77-00385

ENVIRONMENTAL FACTORS IN PRODUCING SUPPLEMENTAL FUELS,
M. R. Beychok.
Hydrocarbon Processing, Vol. 54, No. 10, p. 78-81, 1975. 6 tab, 13 ref. EPA 68-03-2136.

Descriptors: *Environmental effects, *Fuels *Industrial production, Air pollution, Water pollution, Coal, Oil shales, Methane, Natural gas, Efficiencies, Oxides, Energy.
Identifiers: *Alternative energy supplies Synthetic natural gas, Naphtha, Thermal efficiencies.

The degree of air pollution, water utilization, and noise that may be generated by producing supplemental fuels to meet national energy needs are summarized and compared on the basis of tons/unit product Btu output. The industrial processes considered are production of synthetic natural gas from coal, crude oil, and naphtha; production of liquid fuels from oil shale; liquefaction; importing liquid gas (LNG) and as methanol and regasification of LNG. It is estimated that the extraction of 8 to 12 millions tons/yr of coal will require the surface mining of about 250 to 500 acres/yr or a total of 6300 to 15,000 acres over a 25 to 30 year period. On the assumption that a strip mined area can be regraded and revegetated within five years, the maximum amount of land disturbance at any given time would be 1250 to 2500 acres. Underground oil shale mining will entail the disposal of approximately 22.5 million tons/yr of wet spent shale which will pose a leaching hazard, plus the revegetation and reclamation of the shale embankment. It is estimated that a 13% fuel supplement to current oil and gas demand would require mining approximately 1 billion tons/yr of coal and oil shale and might involve almost 400,000 acres of land over a 20 to 25 year span. (Auen-Wisconsin)

THE EFFECT OF HUMANS ON BIOGEOCENOSES AND ENVIRONMENTAL PROTECTION, (IN RUSSIAN),
A. K. Rustamov.
Izv Akad Nauk Turkm SSR Ser Biol Nauk. 6, p 3-9, 1974.

Descriptors: *Ecology, *Environmental effects *Radioactivity effects, *Pesticides, DDT, Industrial wastes, Deserts, Asia, Irrigation practices, Hunting, Mining, Grazing, Construction, Population, *Environmental control.
Identifiers: Biogenesis, *Biogeocenoses, *USSR.

The interaction of the different components in biogeocenosis and the ever-increasing influence of such anthropogenic factors as radioactive fallout, pesticides (particularly DDT), and industrial wastes, are briefly reviewed, followed by discussion of the effect of human activities on the desert biogeocenoses of central Asia (USSR). The effects of hunting, irrigation, mining, livestock grazing, construction projects and other exploitation of desert areas on natural populations (carnivores, large herbivores, birds) are mentioned. Methods of increasing the productivity of desert agrocenoses such as the introduction of a variety of plant and animal species to stabilize cotton monoculture, the use of biological methods of pest control, and the exploitation of wild ungulates as a source of animal protein, are discussed. The importance of environmental protection and the maintenance of optimal interrelations between man and nature is stressed.--Copyright 1976, Biological Abstracts, Inc.

ENVIRONMENTAL CONSIDERATIONS IN EXPANDING AGRICULTURAL PRODUCTION,
Latin American Program for Resources for the Future, Inc., Washington, D.C.
P. R. Crosson.

Journal of Soil and Water Conservation, Vol. 30, No. 1, p 23-28. January-February 1975.

Descriptors: *Environment, *Environmental effects, Agriculture, *Crop production, Grains, Soybeans, Technology, Ecology, Demand, Foreign trade.

The environmental impacts of increasing agricultural production in the U.S. will depend upon the magnitude of the increase and the kind of technology employed to bring it about. In each case the range of possibilities is so wide that well-grounded statements about likely outcomes are difficult. The great imponderable with respect to production is the growth of foreign demand. This has been the major element in the recent dramatic shifts in prices and production of U.S. agricultural commodities, particularly grains and soybeans. U.S. farmers could easily accommodate prospective increases in domestic demand at reasonable costs, probably with a diminishing land base and a set of conservation and other measures designed to control the environmental impacts of expanded production. When the scenario is broadened to include foreign demand, however, the outlook becomes less clear and the possibility of greatly increased pressures on the environment emerges. (Skogerboe-Colo St)

DEVELOPMENT OF A STANDARD RATING FOR THE PRICE PYGMY CURRENT METER,
Geological Survey, Jackson, Miss.
V. R. Schneider, and G. F. Smoot.
Journal of Research of the U S Geological Survey, Vol 4, No 3, p 293-297, May-June 1976. 1 fig, 7 tab, 1 ref.

Descriptors: *Current meters, *Flow measurement, *Discharge(Water), *Instrumentation, *Standards, Quality control, Performance, Reliability, Data collections, Laboratory tests, Variability, Evaluation, Hydromety.
Identifiers: *Price pygmy meters, *Flow meters(Water).

Fifty new Price pygmy current meters, 50 used Price pygmy meters with used rotors, 50 used Price pygmy meters with new rotors, and 26 used Price pygmy meters with straight uniform (nonbeaded) contract wires were rated individually in a towing tank. A standard rating of $V=0.961N+0.039$ ($V=0.293N+0.012$), where V is the velocity in feet per second (meters per second) and N is the meter rotation in revolutions per second, was established for the group of new meters. Repeated ratings of two new meters showed that under the best rating conditions, the individual Price pygmy rating is repeatable to within 1 percent. The standard errors of velocities predicted using the individual ratings and the standard ratings were compared. The use of the standard rating resulted in statistically higher standard errors than the individual ratings for all groups of meters. However, the differences are a fraction of 1 percent higher and are not of concern for practical purposes. The individual ratings and standard rating for the used meters with new straight contact wires were found to be statistically similar to the ratings for the new meters. Continuation of the use of individual ratings of Price pygmy current meters is probably unnecessary with the implementation of precise standards in their manufac-

ture, rating of a random sample, and use. (Woodard-USGS)

Identifiers: *Species diversity.

Methods of determining the species diversity of zooplankton are presented. The problem of the dependence of species diversity on the environment, especially food and the age of the water basin are discussed. The necessity of detailed studies of the biology and population ecology of each species is stressed.–Copyright 1975, Biological Abstracts, Inc.

TOWARDS A COMPUTER-BASED INFORMATION-RETRIEVAL SYSTEM FOR GROUNDWATER DATA,
New Zealand Geological Survey, Christchurch.
R. B. McCammon.
Journal of Hydrology (New Zealand), Vol. 14, No. 1, p 9-19, 1975. 3 fig, 1 tab, 2 ref, 1 append.

Descriptors: *Information retrieval, *Data storage and retrieval, *Groundwater, *Well data, *Data collections, Basic data collections, Hydrologic data, Wells, Water wells, Computers, Computer programs, Automation.
Identifiers: *New Zealand.

In the near future, most regional water boards in New Zealand will have on-going investigations into underground water. Because underground water represents a hidden resource, indirect methods, namely well drilling, must be used in an attempt to better understand underground water supplies. The information obtained from boreholes therefore is of paramount importance. With the greater number of wells being drilled at present together with the well records already on file computer-based systems for information retrieval offer definite promise for the future. A key factor in the design of such a system is the nature of the man-computer dialogue. Question-and-answer, menu-selection and natural-English type dialogues are particularly well suited for the retrieval of water-well records from data files. Whichever system is put forward, it is important that potential users of the system be involved in all stages of development. (Sims-ISWS)

DATA PROCESSING: A REVIEW OF THE ROLE OF THE MINISTRY OF WORKS AND DEVELOPMENT,
Ministry of Works, Wellington (New Zealand). Water and Soil Div.
R. P. Ibbitt.
Journal of Hydrology (New Zealand), Vol. 14, No. 1, p 21-29, 1975. 3 ref.

Descriptors: *Data storage and retrieval, *Information retrieval, *Data processing, *Data collections, Hydrologic data, Surface water, Precipitation(Atmospheric), Rainfall, Water levels, Groundwater, Instrumentation, Equipment, Computers, Computer programs, Automation.
Identifiers: *New Zealand.

When instrumentation is chosen for collecting data, decisions are made, often implicitly, about the purposes for which the data are to be collected and about the accuracy needed to fulfill these purposes. Frequently, unforeseen circumstances affect the type of instrument required or the objective(s) for which the data are being collected

ome of the consequences of the use of inappropriate instruments were examined. A description was then given of the different types of data urrently being processed by the Ministry of Works and Development and of how the type of lata affects the processing. The relative merits of ifferent forms of publication based on the data ere discussed, and the conclusions led to a escription of the ways in which users can obtain he data. (Sims-ISWS)

WATER RESOURCES DATA FOR ALABAMA, WATER YEAR 1975.
Geological Survey, Tuscaloosa, Ala.
Water-Data Report AL-75-1, 1975. 377 p, 7 fig, 3 tab, 46 ref.

Descriptors: *Alabama, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Flow rates, Gaging stations, Lakes, Reservoirs, Chemical analysis, Sediments, Water temperature, Sampling sites, Water levels, Water analysis, Basic data collections.

Water resources data for the 1975 water year for Alabama consists of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels in wells. This report contains discharge records for 97 gaging stations; stage and contents for 12 lakes and reservoirs; water quality for 44 stations and water levels for 47 observation wells. Also included are data from crest-stage partial-record stations. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alabama. (Woodard-USGS)

MAXIMUM KNOWN STAGES AND DISCHARGES OF NEW YORK STREAMS THROUGH 1973,
Geological Survey, Albany, N.Y.
I. R. Leonard, and B. Dunn.
New York State Department of Environmental Conservation, Albany, Bulletin 72, 1976. 67 p.

Descriptors: *Peak discharge, *Flood stages, *Streams, *New York, Hydrologic data, Gaging stations, Data collections, Discharge frequency.
Identifiers: Maximum discharge stages, Period-of-record maximum discharges.

This report is a compilation of all known maximum stages and discharges of New York streams in the files of the U.S. Geological Survey, including some data furnished by other Federal, State, and private organizations. The compilation is an updating of New York State Water Resources Commission Bulletin 67 published in 1970 and includes data through 1973. Maximum stages and rates of discharge have been determined at regular gaging stations, partial-record stations, and at other locations where data became available after floods since about 1900 under cooperative agreement between the State of New York and the U.S. Geological Survey. SOURCE AND TRIBUTARY-SOURCE LINK LENGTHS IN NATURAL CHANNEL NETWORKS,
New South Wales Univ., Kensington (Australia). School of Geography.
A. D. Abrahams, and R. N. Campbell.
Geological Society of America Bulletin, Vol. 87, No. 7, p 1016-1020, July 1976. 5 fig, 2 tab, 11 ref.

Descriptors: *Australia, *Channel morphology, *Drainage patterns(Geologic), *Drainage, Drainage systems, Basins, Geomorphology, On-site investigations, Statistics, Tributaries, Networks.
Identifiers: *Basin morphometry, *Channel networks, Link-length properties, Tributary source, Natural channel networks.

Exterior links may be classified according to the type of link they join at their downstream end. Those which join another exterior link are termed 'source links,' and those which join an interior link are termed 'tributary-source links.' The length distributions of source and tributary-source links were compared for two areas in eastern Australia where channel networks have developed in dissimilar materials under disparate climatic conditions and have reached quite different stages of evolution. Statistical tests confirmed that these two types of links have different length distributions in both areas. In particular, there tended to be relatively more short, and therefore relatively fewer long, source links than tributary-source links. Analyses of length data for both types of links from other areas gave similar results. It was concluded that there are inherent differences between the lengths of source and tributary-source links in natural channel networks. These differences were attributed to a tendency for the lengths of tributary-source links to increase downstream as the lengths of the main valley sides on which they have developed increase. ADJUSTMENT OF STREAM-CHANNEL SHAPE TO HYDROLOGIC REGIME,
Papua and New Guinea Univ., Port Moresby (New Guinea). Dept. of Geography.
G. Pickup.
Journal of Hydrology, Vol. 30, No. 4, p 365-373, August 1976. 1 fig, 1 tab, 14 ref.

Descriptors: *Sediment transport, *Channels, *Geomorphology, *Bed load, Streams, Sediment load, Mathematical studies, Streamflow, Hydraulics, Discharge(Water), Equations.
Identifiers: *Hydrologic regime, Channel geometry, Channel width, Dominant discharge.

Bed load channels tend to adjust their cross-sections so that, given slope, roughness, and sediment load, channel shape approaches the optimum for bed load transport. The extent to which any one shape is the optimum varies with discharge, so four Cumberland Basin stream channels were investigated to determine the discharges at which their present cross-sections represent the optimum for bed load transport. These discharges had return periods ranging from 1.1 to 1.5 years on the annual series. The return periods closely corresponded with return periods for the discharge at which, over a period of time, the most bed load is transported. These return periods varied from 1.15 to 1.45 years when the same bed load equation was used. The close correspondence between sets of return periods suggested that bed load channels tend to adjust their cross-sections to become the optimum shape for bed load transport at or close to the discharge at which the most bed load transport is accomplished. (Lee-ISWS)

SIMILITUDE IN COASTAL ENGINEERING,
Tetra Tech. Inc., Pasadena, Calif.
B. LeMehaute.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW3, Proceedings Paper 12293, p 317-335, August 1976. 2 fig, 13 ref.

Descriptors: *Model studies, *Sediment transport, Waves(Water), Coastal engineering, Hydraulic models, Hydraulics, Equations, Froude number, Reynolds number, Head loss, Structures, Beds.
Identifiers: *Similitude, *Scale effect, Scale models, Wave energy, Froude similitude, Reynolds similitude, Movable bed models.

The basic principles of the engineering approach to similitude were given with emphasis on coastal engineering applications. In contrast to the parallel that exists between the Froude similitude and the Reynolds similitude as it is often formerly presented, the parallel between the similitude of 'short' model and similitude of 'long' model was stressed as the most practical engineering approach to scale model technology. Scale effects were determined quantitatively as the results of viscous damping and capillary effects. Density effects were examined, and the problem of similitude of wave forces—or more generally of time-dependent phenomenons-were quantitatively determined. Some digressions on movable bed scale models were also presented. (Lee-ISWS)

DRILLING MUD INVASION OF UNCONSOLIDATED AQUIFER MATERIALS,
New South Wales Univ., Kensington (Australia). Water Research Lab.
C. R. Dudgeon, and R. J. Cox.
Australian Water Resources Council, Canberra. Technical Paper No. 17, 1976. 216 p, 15 fig, 2 tab, 23 ref, append.

Descriptors: *Drilling fluids, *Unconsolidated aquifers, *Water wells, *Water yield, Drilling, Boreholes, Aquifer characteristics.

All drilling methods impair the ability of an aquifer to deliver water to the drilled hole; where drilling mud is used, and aquifer pores are large enough, the excess hydrostatic head relied upon to maintain the open hole will force the mud and cutting into the surrounding aquifer. Details of a series of tests with commonly used drilling muds, to examine development of filter cakes, the depth of mud invasion, and the degree of permanent formation damage under various flow conditions, are presented. Guidelines are provided for the choice and use of drilling fluid materials. (CSIRO)

TUNNELLING MACHINE USED FOR DRAI TUNNEL FOR ROUNDHILL SEWAGE TREAT MENT WORKS BREAKS RECORD.
Water Services, Vol 80, No 963, p 312, 316, May 1976.

Descriptors: *Tunnel construction, *Tunnel design, *Tunneling machines, *Tunnelin *Drainage systems, Sewage treatment, Treatme facilities, Equipment, Construction, Hydrau structures, Drains.

The construction of a 500-meter drain tunnel for sewage treatment works is discussed, with particular emphasis on the tunnelling machine used which did the job in record time. The material being tunnelled consisted of Bunter pebble beds and Bunt sandstone. The tunnel shape chosen was one w a straight base and an arched roof. The machi chosen to drive the tunnel was an Atlas Cop Mini Full Facer which has also proven itself such materials as dolomitic limestone, abrasi limestone, and metamorphus limestone. Up to 3 meters of tunnelling was accomplished in one d (20 digging hours) with the machine as compar to the previous record of 22 meters. The init entry of the machine was aided by the constru tion of concrete walls at the starting end in orc that the gripper pads would have solid material push against. The machine is designed to work i depth of 1 foot of water. (Kreager-FIRL)

W. S. Gaither.
Available from the National Technical Information Service, Springfield VA 22161 as PB-248 335, Price codes: A21 in paper copy, A01 in microfiche. Delaware University College of Marine Studies Final Workshop Report to NSF-RANN No. NSF-RA-E-75-054B, May 1975. 95 p, 9 append. NSF-GI-43111.

Descriptors: *Islands, *Economics, *Environmental effects, *Structure, *Construction, Legal aspects.
Identifiers: *Artificial islands(Ports), U.S. East Coast, Gulf Coast, Deepwater ports, Islands(Artificial), Islands(Man-made), Offshore industrial islands.

This study was designed to evaluate the economic engineering, legal, and environmental possibility of large (four to six square mile) artificial industrial/port islands located off the U.S. Atlantic and Gulf Coasts, and is reported in two volumes. This volume describes the procedures and results from the workshop which was conducted to identify major problems and promising approaches to solve the problems associated with man-made islands. The workshop was divided into the following functional groups: (1) Economics and Finance; (2) Industrial Tenants; (3) Environmental; (4) Legal and Institutional; and (5) Structure and Construction. EFFECT OF IRRIGATION PUMPING ON DESERT PUPFISH HABITATS IN ASH MEADOWS, NYE COUNTY, NEVADA,
Geological Survey, Carson City, Nev.
V. W. Dudley, Jr., and J. D. Larson.
Available from USGS, 604 S. Pickett St. Alexandria, Va. 22304, price $1.45. Professional Paper 927, 1976. 52 p, 24 fig, 8 tab, 29 ref.

Descriptors: *Ecology, *Fish, *Irrigation, *Pumping, *Groundwater, Environmental effects, Arid lands, Lakes, Collapse, *Nevada, Irrigation water, Springs.
Identifiers: *Desert pupfish, *Rare fish species, *Cyprinodon, Devils Hole(Nev).

The Ash Meadows area, at the southern tip of the Amargosa Desert in southern Nevada, discharges ground water collected over several thousand square miles of a regional flow system developed in Paleozoic carbonate rocks. Water moves westward across fault contacts from the bedrock into poorly interconnected gravel, sand, and terrestrial-limestone aquifers in the upper few hundred feet of the basin sediments at Ash Meadows. A small pool in Devils Hole, which is a collapse depression in Cambrian limestone, and numerous springs in the adjacent desert valley contain rare fish species of the genus Cyprinodon, faunal remnants of Pleistocene lakes. The Devils Hole pupfish, C. diabolis, is the most endangered of the several surviving species that have evolved since the post-pluvial isolation of their ancestors. This population feeds and reproduces on a slightly submerged rock ledge. Recent irrigation pumping has nearly exposed this ledge. Correlation of pumping histories with the stage in Devils Hole allows identification of several wells that affect the pool level most severly. Some springs that are habitats for other species of Cyprinodon have reduced discharge because of pumping. Hydraulic testing, long-term water-level monitoring, water quality, and geologic evidence aid in defining the principal flow paths and hydraulic interconnections in the Ash Meadows area. (Woodard-USGS)

R. Kreplick, and J. C. Sawyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 767, Price codes: A09 in paper copy, A01 in microfiche. WRRC Pub. No. 73, Completion Report FY-76-17, June 1976. 144 p, 1 fig, 11 tab, 79 ref, 8 append. OWRT A-076-MASS(1). 14-31-0001-5021.

Descriptors: *Information exchange, Technology, Information retrieval, Communication, *Attitudes.
Identifiers: *Information transfer, *Technology transfer.

The interpersonal user group approach was utilized to communicate relevancy of water resources research to local, state, and federal agency personnel. Approximately 100 professionals participated in stages of the project, from experience interviews to interaction in 18 informal meetings. Discussion is presented in the context of pertinent studies, communication patterns and systems, perceptions of institutional arrangements, current utilization and fields related to research utilization. The effectiveness of interpersonal communication was measured by a questionnaire on the awareness and attitude dimensions. Auxiliary measures included an in-meeting observational technique, and content analysis of taped meetings categorized according to questionnaire dimensions. The awareness items concentrated on knowledge, prior contact, and sources utilized; the attitude scale included applicability of research, the need for user/researcher contact, and research availability. Results showed some significant positive change in awareness responses. Reaction to the Likert scale showed an intuitively neutral to slightly positive result on pre- and post-test for both users and researchers although individual items showed significant positive change. Researchers and users were positive about the need for contact and user input in formulating research questions; however, political and economic considerations and user/researcher perceptions of each group's practical problems showed neutral to negative reactions. Content analysis supported questionnaire results. The findings showed both the potentials and the barriers to interpersonal interaction. However, the user group mechanism is recommended for continued feedback for the utilization of water resources research.
W77-00151

SUBJECT INDEX

BANDONED FEED LOTS
Nitrogen in Soil Cores and Ground Water Under Abandoned Cattle Feedlots,
W77-00365 5B

BSORPTION
Interaction Between Aquatic Plants and Bed Sediments in Mercury Uptake from Flowing Water,
W77-00301 5C

CCIDENT PREVENTION
Developing a Total Oil Spill Cleanup Capability in the San Francisco Bay Area,
W77-00200 5G

CIDS
Volatile Fatty Acids in Bottom Deposits of the Rybinsk Reservoir, (In Russian),
W77-00126 5C

CTIVATED CARBON
Cross-Flow Filtration in Physical-Chemical Treatment of Municipal Sewage Effluents,
W77-00042 5D

Activated Carbon Odor Control System,
W77-00056 5D

Powdered Activated Carbon Improves Anaerobic Digestion,
W77-00067 5D

Sorption on Activated Carbon of Impurities of Textile Industry Effluents (Sorpcja zanieczyszczen ze sciekow przemyslu wlokienniczego na weglu aktywnym),
W77-00339 5D

CTIVATED SLUDGE
Processing, Economics and Sale of Heat Dried Sludge,
W77-00037 5D

Oxygen for Effluent Treatment.
W77-00060 5D

New Acton Grange Works.
W77-00061 5D

Evaluation of Activated Sludge Control Techniques Through Pilot Plant and Computer Analyses,
W77-00157 5D

DSORPTION
Physical-Chemical Treatment Improves Iran's Urban Runoff,
W77-00077 5D

Manganese and Iron Removal from Water by Adsorption on Diatomaceous Earth,
W77-00155 5F

The Effect of Soil Properties on Zinc Adsorption by Soils,
W77-00469 2G

Interactions Between Organic Compounds, Minerals, and Ions in Volcanic Ash Derived Soils: I. Adsorption of Benzoate, P-OH Benzoate, Salicylate, and Phthalate Ions,
W77-00473 2G

Interactions Between Organic Compounds, Minerals, and Ions in Volcanic-Ash-Derived Soils: II. Effects of Organic Compounds on the Adsorption of Phosphate,

Decrease of Bacterial Content in Different Types of Stabilization Ponds,
W77-00080 5D

Biological Purification of the Izmail Board Mill Effluents (Biologicheskaya ochistka stochnykh vod Izmail'skogo Tsellyulozno-Kartonnogo Kombinata),
W77-00322 5D

BIOMASS
Study of the Ural River Benthos, (In Russian),
W77-00091 2I

Biological Seasons in the Zooplankton of Davis Strait,
W77-00398 5C

Consumption of Organic Matter of Muds by Ilyocryptus Sordidus (Cladocera, Macrothricidae), (In Russian),
W77-00507 5C

BIRMINGHAM (GT. BRIT)
Planning and Construction of Birmingham's Main Outfall Sewer,
W77-00072 5D

BLACK BOX PARAMETER ESTIMATION
A Stable Estimator for Linear Models 1. Theoretical Development and Monte Carlo Experiments,
W77-00123 4A

BLACKSTONE RIVER BASIN (MASS-RI)
Numerical Estuarine Models for Water Quality Management in the Blackstone River-Providence River and the Taunton River-Mt. Hope Bay Complexes,
W77-00152 5B

BLEACHING WASTES
Bleachability of Softwood and Hardwood Kraft Pulps in Ozone Bleaching (In Japanese),
W77-00330 5D

Color Removal from Softwood Kraft Caustic Extract Effluent by Polyamines,
W77-00335 5D

Process for Treating Waste Water (Verfahren zur Behandlung von Abwasser),
W77-00343 5D

Identification of Two Chlorinated Guaiacols in Kraft Bleaching Wastewaters,
W77-00459 5A

Effluent-Free Bleached Kraft Pulp Mill. Part VII. Sodium Chloride in Alkaline Pulping and Chemical Recovery,
W77-00466 3E

Chlorinated Guaiacols in Bleachery Wastes: Comments on a Paper by Leach and Thakore,
W77-00467 5A

(Chlorinated Guaiacols in Bleachery Wastes—) Response to the Comments of I. H. Rogers,
W77-00468 5A

BOTTOM DEPOSITS
Volatile Fatty Acids in Bottom Deposits of the Rybinsk Reservoir, (In Russian),
W77-00126 5C

BOTTOM SEDIMENTS
Behavior of Mercury in Suspended Solids and Bottom Sediments,
W77-00007 5C

Investigation of Bacteriological Pollution of Recreational Waters in Arizona,
W77-00153 5B

Interaction Between Aquatic Plants and Bed Sediments in Mercury Uptake from Flowing Water,
W77-00301 5C

Distribution of Benthonic Foraminifers Off the Western Coast of South America, (In Russian),
W77-00496 2L

Consumption of Organic Matter of Muds by Ilyocryptus Sordidus (Cladocera, Macrothricidae), (In Russian),
W77-00507 5C

BOUND WATER
Hydraulic Conductivity in Surface Active Soils,
W77-00441 2G

BRACKISH WATER
Potamogeton Perfoliatus in a Brackish-Water Estuary at Ora, Fredrikstad (S. Norway), (In Norwegian),
W77-00508 5C

BRAIDING
Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

BRAIDING CHANNELS
Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

BRIDGE DESIGN
Floodflow Characteristics at Proposed Bridge Site on Fishkill Creek, Fishkill, New York,
W77-00483 4C

BRITISH COLUMBIA
Measurements of Estuary Dispersion Coefficients,
W77-00381 5B

BROADLEAF EVERGREEN FORESTS
The Broadleaf Evergreen Forests of Japan, (In German),
W77-00499 4A

BROWARD COUNTY (FLA)
Ground-Water Quality in the Davie Landfill, Broward County, Florida,
W77-00486 5B

BUBBLES
Oxygen for Effluent Treatment.
W77-00060 5D

BULK DENSITY
Soil Bulk Densities after Thirty Years under Different Management Regimes,
W77-00287 2G

BYPRODUCTS
Recent Advances in Sludge Treatment and Disposal,
W77-00064 5D

BYRD STATION
Effect of Porosity on the Hydrostatic Compression of Ice,
W77-00355 2C

CADMIUM
Environmental Impact of Cadmium and Other Heavy Metals from Land-Applied Sewage Sludge,
W77-00002 5C

Plant Uptake of Heavy Metals from Sewage Sludge Applied to Land,
W77-00028 5D

The Determination of Zinc, Cadmium, Lead and Copper in a Single Sea-Water Sample by Differential Pulse Anodic Stripping Voltammetry,
W77-00321 5A

Trace-Metal Levels in the Waters and Sediments of Corio Bay (Australia),
W77-00446 5A

CALANUS
Phylogeny of the Family Calanidae(Copepoda) on the Basis of a Comparative Morphological Analysis of its Characters,
W77-00394 5C

Structure of the Mandibles in the Genus Calanus S.L. in Relation to Latitudinal Zonality,
W77-00396 5C

CALANUS PLUMCHRUS
Intraspecific Differentiation of Calanus Plumchrus Marukawa,
W77-00401 5C

CALCAREOUS SOILS
Sorption of Sulfur Dioxide by Calcareous Soils,
W77-00295 5B

CALIBRATIONS
Float Calibration in Integrated-Float Techniques,
W77-00088 7B

The Effect of Bulk Density on Neutron Meter Calibration,
W77-00440 2G

CALIFORNIA
Measurements of Liquid Water Content in Winter Cloud Systems Over the Sierra Nevada,
W77-00164 2B

Developing a Total Oil Spill Cleanup Capability in the San Francisco Bay Area,
W77-00200 5G

A Study of the Effects of the San Francisco Oil Spill on Marine Organisms,
W77-00270 5C

Effect of Anion Exclusion on the Movement of Chloride Through Soils,
W77-00293 5B

Seabed Drifter Movement in San Diego Bay and Adjacent Waters,
W77-00356 5B

Sediment Discharge in the Upper Arroyo Grande and Santa Rita Creek Basins, San Luis Obispo County, California,
W77-00487 2J

One-Dimensional Simulation of Aquifer System Compaction near Pixley, California: 2. Stress-Dependent Parameters,
W77-00490 2F

CALORIC VALUES (INVERTEBRATES)
Caloric Values of the Most Abundant Invertebrates of Two Woodland-Brooklets of the 'Naturpark Kottenforst-Ville', (In German),
W77-00415 2I

CANADA
Kaministiquia Interceptor Sewer Completed in Thunder Bay.
W77-00076 5D

Compositional Changes of a Fuel Oil from an Oil Spill Due to Natural Exposure,
W77-00183 5B

Isolation and Identification of Blue-Green Algae Producing Muddy Odor Metabolites, Geosmin, and 2-Methylisoborneol, in Saline Lakes in Manotoba,
W77-00185 5A

The Isolation and Characterization of Hydrocarbon-Utilizing Bacteria from Chedabucto Bay, Nova Scotia,
W77-00244 5A

Interaction Between Aquatic Plants and Bed Sediments in Mercury Uptake from Flowing Water,
W77-00301 5C

Status Report on Abatement of Effluents from the Canadian Pulp and Paper Industry -- 1974.
W77-00331 5G

Measurements of Estuary Dispersion Coeffi-
cients,
W77-00381 5B

Fate of Selected Organic Compounds in the
Discharge of Kraft Paper Mills into Lake Su
perior,
W77-00457 5B

Persistent Organic Compounds from a Pulp
Mill in a Near-Shore Freshwater Environment,
W77-00458 5B

Identification of Two Chlorinated Guaiacols i
Kraft Bleaching Wastewaters,
W77-00459 5A

CANYON LAKE (ARIZ)
Investigation of Bacteriological Pollution o
Recreational Waters in Arizona,
W77-00153 5B

CARBOHYDRATES
Hydrolysis of Press Waste Waters from th
Manufacture of Fiber (Insulation) Board
(Contributii la studiul procesului de hidroliza
apelor de presa din circuitul de fabricatie a
P.F.L.),
W77-00324 5D

CARBON
Denitrification Rates in Relation to Total an
Extractable Soil Carbon,
W77-00294 2G

CARBON-14
Transport of Carbon14-Assimilates in the Suga
Beet Under Different Conditions of Nutritio
and Moisture, (In Russian),
W77-00421 5D

CARBONATES
Sodium Carbonate in Ground Waters of th
Turkmen SSR, (In Russian),
W77-00384 3C

CASCO BAY (MA)
Use of the Massachusetts Dip Oil Skimmer o
Free Slicks in the Casco Bay (Portland) Spill,
W77-00265 5C

CASCO (ME)
Flood Hazard Analysis: Crooked River, Tow
of Casco, Town of Naples, Cumberland Cou
ty, Maine,
W77-00100 4A

CASCO (WIS)
Environmental Impact of Cadmium and Othe
Heavy Metals from Land-Applied Sewag
Sludge,
W77-00002 5C

CATION EXCHANGE
Effect of Anion Exclusion on the Movement o
Chloride Through Soils,
W77-00293 5B

Use of Ammonia Electrode for Determinatio
of Cation Exchange Capacity in Soil Studies,
W77-00300 2G

Graphical Representation of Tricationi
Exchanges Where One of the Cations is th
Proton,
W77-00304 2G

CATION EXCHANGE CAPACITY
The Effect of Soil Properties on Zinc Adsorp
tion by Soils,
W77-00469 2G

CELL RESIDENCE TIME
Evaluation of Activated Sludge Control Techniques Through Pilot Plant and Computer Analyses,
W77-00157 5D

CENSUS
A Case Study of Citizen Participation in Resource Planning: The Crawford County Critical Resource Information Workshop.
W77-00171 6B

CENTRIFUGATION
New Method of Sewage Sludge Decontamination, (In Russian),
W77-00352 5D

Centrifuge Plus Lime Limits Lignin in Waste Water,
W77-00464 5D

CHANCE-CONSTRAINED PROGRAMMING
Optimal Design of Single Reservoir System Using (Delta) Relase Policy,
W77-00109 4A

CHANDLER'S SCORE SYSTEM
Biological Assessment of Water Quality in Three British Rivers: The North ESK (Scotland), The Ivel (England) and the TAF (Wales),
W77-00108 5A

CHANNEL EROSION
Channel Erosion Surveys Along Taps Route, Alaska, 1975,
W77-00433 2J

CHANNEL MORPHOLOGY
Source and Tributary-Source Link Lengths in Natural Channel Networks,
W77-00084 8B

Link Slope Distribution in Channel Networks,
W77-00370 2A

Similarity of the Mean Motion of Fluid Particles Dispersing in a Natural Channel,
W77-00371 5B

Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

CHANNEL NETWORKS
Source and Tributary-Source Link Lengths in Natural Channel Networks,
W77-00084 8B

CHANNELS
Environmental Impact of Stream Channelization,
W77-00375 6G

Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

Adjustment of Stream-Channel Shape to Hydrologic Regime,
W77-00379 8B

CHECK STRUCTURES
Gully Development and Control: The Status of Our Knowledge,
W77-00097 2J

CHEMICAL ANALYSIS
Chemical Changes in the Soil Solution from a Spodosol Irrigated with Secondary-Treated Sewage Effluent,
W77-00040 5E

CHEMICAL MODELING
A Phosphorus Residence Time Model: Theory and Application,
W77-00124 5B

CHEMICAL OXYGEN DEMAND
A Summary of Observations on Thermophilic Digester Operations,
W77-00035 5D

Waste Water Treatment at SCP (Semichemical Pulp), CGP (Chemigroundwood Pulp) Mills,
W77-00329 5D

CHEMICAL PRECIPITATION
Color Removal from Softwood Kraft Caustic Extract Effluent by Polyamines,
W77-00335 5D

Centrifuge Plus Lime Limits Lignin in Waste Water,
W77-00464 5D

CHEMICAL PROPERTIES
Chemical Composition and Food Value of Some Members of Freshwater Zooplankton in Ponds of the Southern Moldavian SSR, (In Russian),
W77-00509 2H

CHEMICAL REACTIONS
Chemical Weathering of Glauconite,
W77-00289 2K

CHEMICAL RECOVERY
Effluent-Free Bleached Kraft Pulp Mill. Part VII. Sodium Chloride in Alkaline Pulping and Chemical Recovery,
W77-00466 3E

CHEMICAL WASTES
Effectiveness of Wastewater Treatment at the Shostka 50th Anniversary of the USSR Chemical Plant, (In Russian),
W77-00351 5D

CHEMICAL WEATHERING
Chemical Weathering of Glauconite,
W77-00289 2K

CHEMILUMINESCENCE
Chemiluminescence Method of Determining Copper in Natural Waters, (In Russian),
W77-00404 5A

CHEMOAUTOTROPHS
Modeling of the Transformation of Nitrogen Compounds in a Closed Aquatic Chemical-Ecological Microsystem, (In Russian),
W77-00494 5B

CHERNOZEMS
The Change of Clay Material in Chernozems Under Rice Cultivation, (In Russian),
W77-00523 2G

CHESAPEAKE BAY
Coliform Bacteria from Diffuse Sources as a Factor in Estuarine Pollution,
W77-00359 5B

CHESTNUT SOIL *PERMEABILITY
Water Permeability of Dark-Chestnut Soils of the Kustanai Oblast, (In Russian),
W77-00501 2G

CHESTNUT SOILS
Light-Chestnut Long-Irrigated Soil of the Sharur Plain, (In Russian),
W77-00510 2G

CHICAGO (ILL)
AWT Plant Begins Operations.
W77-00055 5D

CHILE
Interactions Between Organic Compounds, Minerals, and Ions in Volcanic Ash Derived Soils: I. Adsorption of Benzoate, P-OH Benzoate, Salicylate, and Phthalate Ions,
W77-00473 2G

Interactions Between Organic Compounds, Minerals, and Ions in Volcanic-Ash-Derived Soils: II. Effects of Organic Compounds on the Adsorption of Phosphate,
W77-00474 2G

Diet of Hippoglossina Macrops (Steindachner) in Mejillones (Pisces, Bothidae), (IN Spanish),
W77-00502 2L

CHIPPEWA FALLS (WIS)
Environmental Impact of Cadmium and Other Heavy Metals from Land-Applied Sewage Sludge,
W77-00002 5C

CHLAMYDOMONAS
The Elimination of Phosphates and Nitrates from Waste Water by Algal Cultures: II. Tertiary Treatment Potential of Algae, (In Dutch),
W77-00110 5D

CHLORELLA
The Extra 02 Evolved During Nitrate Utilization by Chlorella,
W77-00191 5C

CHLORIDES
Effect of Anion Exclusion on the Movement of Chloride Through Soils,
W77-00293 5B

CHLORINATED GUAIACOLS
Chlorinated Guaiacols in Bleachery Wastes: Comments on a Paper by Leach and Thakore,
W77-00467 5A

CHLORINATED HYDROCARBON PESTICIDES
Associations of Chlorinated Hydrocarbons with Fine Particles and Humic Substances in Nearshore Surficial Sediments,
W77-00086 5A

Chlorinated Hydrocarbon Pesticides in Western North Atlantic Ocean,
W77-00325 5B

CHLORINATED ORGANIC COMPOUNDS
Wastewater Ozonation: A Process Whose Time Has Come,
W77-00099 5D

CHLORINATION
Agricultural Runoff as a Source of Halomethanes in Drinking Water,
W77-00163 5B

CHLORINATION PRODUCTS
Agricultural Runoff as a Source of Halomethanes in Drinking Water,
W77-00163 5B

CHLORINE
Wastewater Ozonation: A Process Whose Time Has Come,
W77-00099 5D

Comparative Studies on the Action of Chlorine and Ozone on Polioviruses in the Reprocessing of Drinking Water in Essen, (In German),
W77-00419 5F

CHLOROPHYLL
Fort River Ecosystem: Productivity of the Periphyton Component,
W77-00149 5C

Surface Nutrients, Chlorophyll-A and Phaeopigment in Some Scottish Sea Lochs,
W77-00182 5C

The Use of ERTS-1 to More Fully Utilize and Apply Marine Station Data to the Study and Productivity Along the Eastern Shelf Waters of the United States,
W77-00198 5A

CHLOROPHYTA
Nitrogen Excretion by Nitrogen Fixing Blue-Green Algae: III. Utilization of the Excreted Nitrogen by Green Algae, (In German),
W77-00006 5C

The Extra 02 Evolved During Nitrate Utilization by Chlorella,
W77-00191 5C

CHROMATOGRAPHY
Variability of Amino Acid Composition of Algae Inhabiting the Zone of Variable Salinity, (In Russian),
W77-00345 5A

CHROMOSOME ABNORMALITIES
Chromosome Mutagenesis in Developing Mackerel Eggs Sampled from the New York Bight,
W77-00274 5C

CHUKCHI SEA
On the Flow Through Barrow Canyon,
W77-00134 2L

CITIES
Ecologically Balanced Community Wastewater Disposal Systems Management for Developing Countries,
W77-00066 5D

Urban Stormwater Detention and Flow Attenuation,

COST ALLOCATION
A Balanced Regional Input-Output Model for Identifying Responsibility for Pollution Created by Industries Which Serve National Markets,
W77-00382 5G

COST ANALYSIS
Energy Conservation Practices in Municipal Sludge Management,
W77-00018 5D

Discounted Cash Flow Analysis to Select Equipment,
W77-00049 5D

The Relevance of Technological Change in Long Term Water Resource Planning,
W77-00113 6B

COST-BENEFIT ANALYSIS
Computer Evaluation of Sludge Handling and Disposal Costs,
W77-00012 5D

Sludge Management Alternatives for Coastal Cities,
W77-00014 5E

Sludge Disposal Alternatives for Boston,
W77-00016 5E

An Overview of the Impact Study of the McClellan-Kerr Multiple Purpose Arkansas River System,
W77-00101 6G

Using Linear Programming to Evaluate Agricultural Flood Control Projects,
W77-00180 3F

COST COMPARISONS
Discounted Cash Flow Analysis to Select Equipment,
W77-00049 5D

The Cost of Physical Chemical Treatment (PCT) Waste Water,
W77-00445 5D

COST MINIMIZATION
A Reliability Assessment for Regional Water Quality Management,
W77-00114 5G

Economic Optimum Record Length,
W77-00117 4A

COSTS
Sewering The City of New York,
W77-00070 5D

COWS
Effect of Sprinkling Pastures with Potato Starch Factory Waste Effluents on Quality of Raw Milk, and Development of a Process for Removal of Protein, Amino Acids and Potassium from Wastes. (In Japanese)
W77-00420 5D

CRICOTOPUS-SILVESTRIS
Larval Populations of Chironomidae in the Periphyton of the Yugoslav Part of the Danube Between Biograd and Tekija, (In German),
W77-00413 5C

CROOKED RIVER (ME)
Flood Hazard Analysis: Crooked River, Town of Casco, Town of Naples, Cumberland County, Maine,
W77-00100 4A

CROP PRODUCTION
A Water Balance Model and Supply Index for Wheat in South Australia,
W77-00444 3F

Environmental Considerations in Expanding Agricultural Production,
W77-00470 6G

Erosion in 1973-74: The Record and the Challenge,
W77-00471 2J

CROP RESPONSE
Leaf Photosynthesis: The Influence of Environmental Variables,
W77-00302 2I

CRUSTACEANS
Fishery and Biology of Metapenaeus Monoceros (Fabricius) from the Godavari Estuarine System,
W77-00424 2L

Consumption of Organic Matter of Muds by Ilyocryptus Sordidus (Cladocera, Macrothricidae), (In Russian),
W77-00507 5C

Role of Predatory Cladocera in the Feeding of the Charkhal Kilka Clupeonella Delicatulacaspia Morpha Tscharchalensis (Borodin) in Kuibyshev Reservoir, (In Russian),
W77-00520 2H

CULTIVATED LANDS
Water Permeability of Dark-Chestnut Soils of the Kustanai Oblast, (In Russian),
W77-00501 2G

CULTIVATION
Soil Bulk Densities after Thirty Years under Different Management Regimes,
W77-00287 2G

Effect of Ploughing and Direct Drilling on Soil Nitrate Content,
W77-00305 2G

CULTIVATION PRACTICES
Effect of Ploughing and Direct Drilling on Soil Nitrate Content,
W77-00305 2G

CURRENT METERS
Development of a Standard Rating for the Price Pygmy Current Meter,
W77-00432 7B

CURRENTS (WATER)
Continental Shelf Waves in the Florida Straits,
W77-00133 2L

Determination of Lagrangian Deformations from Analysis of Current Followers,
W77-00136 2L

On the Influence of Water Currents on the Growth of Hydrorhizal Colonies, (In German),
W77-00506 2I

CYANOPHYTA
Nitrogen Excretion by Nitrogen Fixing Blue-Green Algae: III. Utilization of the Excreted Nitrogen by Green Algae, (In German),
W77-00006 5C

Isolation and Identification of Blue-Green Algae Producing Muddy Odor Metabolites, Geosmin, and 2-Methylisoborneol, in Saline Lakes in Manotoba,
W77-00185 5A

CYPRINODON
Effect of Irrigation Pumping on Desert Pupfish Habitats in Ash Meadows, Nye County, Nevada,
W77-00427 8I

CZECHOSLOVAKIA
The Environment and the Structure of Social Goals,
W77-00181 5G

DANUBE RIVER
Hydrogeochemical Investigation of the Danube Water in Austria During the Years 1971 and 1972, (In German),
W77-00406 5A

The Importance of Bacteriological Investig
tions for the Classification of flowing Wat
Bodies, Demonstrated on the Austrian Part
the Danube, (In German),
W77-00407

Events in the Djerdap Reservoir Immediate
After Impoundment, (In German),
W77-00409

Larval Populations of Chironomidae in t
Periphyton of the Yugoslav Part of the Danu
Between Biograd and Tekija, (In German),
W77-00413

Changes in the Chironomid Fauna Caused
Damming the Danube, (In German),
W77-00414

DATA BASE MANAGEMENT SYSTEM
OR Data Base Interface--An Application
Pollution Control,
W77-00116

DATA COLLECTIONS
User's Guide for Hydrologic Informati
Storage and Retrieval System,
W77-00161 1

State of South Carolina Weather and Cr
Summaries,
W77-00282

Towards A Computer-Based Informatio
Retrieval System for Groundwater Data,
W77-00377

Data Processing: A Review of the Role of t
Ministry of Works and Development,
W77-00378

DATA PROCESSING
Biological Assessment of Water Quality
Three British Rivers: The North ES
(Scotland), The Ivel (England) and the TA
(Wales),
W77-00108

Determination of Lagrangian Deformatio
from Analysis of Current Followers,
W77-00136

Data Processing: A Review of the Role of t
Ministry of Works and Development,
W77-00378

Stoichiometric Distance and Total Concentr
tion: A Binary Numerical Description of Inla
Water Cehmistry,
W77-00449

DATA STORAGE AND RETRIEVAL
Towards A Computer-Based Informatio
Retrieval System for Groundwater Data,
W77-00377

Data Processing: A Review of the Role of t
Ministry of Works and Development,
W77-00378

DAVIS STRAIT (NORTH ATLANTIC OCEAN)
Biological Seasons in the Zooplankton of Dav
Strait,
W77-00398

DDE
Chlorinated Hydrocarbon Pesticides in Weste
North Atlantic Ocean,
W77-00325

ECISION-MAKING
Inter-Plan Communication and Motivation Study, Final Report, Florida Background Study,
W77-00098 6B

An Overview of the Impact Study of the McClellan-Kerr Multiple Purpose Arkansas River System,
W77-00101 6G

Economic Optimum Record Length,
W77-00117 4A

Conceptual Framework of Environmental Management,
W77-00178 6G

Decision-Making in Recreational Fisheries Management: an Analysis,
W77-00391 6B

ECOMPOSING ORGANIC MATTER
Effect of Alternate Aerobic and Anaerobic Conditions on Redox Potential, Organic Matter Decomposition and Nitrogen Loss in a Flooded Soil,
W77-00306 5B

Relationships Between the Denitrification Capacities of Soils and Total, Water-Soluble and Readily Decomposable Soil Organic Matter,
W77-00311 2G

Proximate Nutritive Value Changes During Decomposition of Salt Marsh Plants,
W77-00402 5C

EGRADATION (DECOMPOSITION)
Secondary Degradation of Sulfite Mill Waste Water by Development of Algal Masses (Sekundaerabbau von Sulfitzellstoffabwasser durch Algen-Massenentwicklungen),
W77-00341 5D

EHYDRATION
Effect of Dehydration and Elevated Temperature on Leaf Cell Thermoresistance of a Drought-Sensitive Barley Cultivar, (In Russian),
W77-00503 2I

ELTAS
Beware The Wrath Of Osiris,
W77-00177 4A

ENITRIFICATION
Capacity of a Spartina Salt Marsh to Assimilate Nitrogen from Secondarily Treated Sewage,
W77-00003 5B

Denitrification Rates in Relation to Total and Extractable Soil Carbon,
W77-00294 2G

Formation of Chemical and Biological Denitrification Products in Flooded Soil at Controlled pH and Redox Potential,
W77-00308 2G

Relationships Between the Denitrification Capacities of Soils and Total, Water-Soluble and Readily Decomposable Soil Organic Matter,
W77-00311 2G

ENSITY
Automatic High Density Sludge Discharge Control Using Ultrasonics.
W77-00058 5D

DENVER (COLO)
Alternatives for Disposal for the Metropolitan Denver Sewage Disposal District No. 1,
W77-00017 5E

DESERT PUPFISH
Effect of Irrigation Pumping on Desert Pupfish Habitats in Ash Meadows, Nye County, Nevada,
W77-00427 8I

DESERTS
Water Relations of Glycyrrhiza Glabra L. Under Desert Conditions,
W77-00500 2I

DESIGN
Optimal Design of Single Reservoir System Using (Delta) Relase Policy,
W77-00109 4A

Economic Optimum Record Length,
W77-00117 4A

The Design of an Inexpensive Rain Gage with Both Amount and Rate Capabilities,
W77-00160 2B

Offshore Industrial-Port Islands,
W77-00176 5G

Design of a Refinery Dock to Prevent Oil Spills,
W77-00205 5G

Design Parameter Study of an Oil-Spill Boom,
W77-00245 5G

DESIGN CRITERIA
Application of a Hydrologic Model to the Planning and Design of Storm Drainage Systems for Urban Areas,
W77-00004 4A

Sludge Drying Beds are Practical, Part 1,
W77-00039 5D

Flow Approaching Filter Washwater Troughs,
W77-00053 5D

Wastewater Plant Design Reduces Off-Site Energy Needs.
W77-00059 5D

Functional Design of Sanitary Sewers,
W77-00068 5D

Planning and Construction of Birmingham's Main Outfall Sewer,
W77-00072 5D

DESMAN LANDS
Significance of Water Vegetation in Desman Lands of the European Section of the USSR, (In Russian),
W77-00411 2I

DESORPTION
Relationships Between Sorption and Desorption of Phosphorus by Soils,
W77-00298 5B

Interactions Between Organic Compounds, Minerals, and Ions in Volcanic Ash Derived Soils: I. Adsorption of Benzoate, P-OH Benzoate, Salicylate, and Phthalate Ions,
W77-00473 2G

DETECTION
Tagging Oil-Residues in Tankers with Microparticles,
W77-00211 5A

DETENTION RESERVOIRS
Urban Stormwater Detention and Flow Attenuation,
W77-00078 5D

DETERMINING EVAPORATION
A Simple Method for Determining the Evaporation from Shallow Lakes and Ponds,
W77-00127 2D

DEVELOPING COUNTRIES
The Integration of Environmental and Development Planning for Ecological Crisis Areas in Africa,
W77-00385 6G

DEWATERING
Sludge Disposal Alternatives for Boston,
W77-00016 5E

Sludge Drying Beds are Practical, Part 1,
W77-00039 5D

DIATOMACEOUS EARTH
Manganese and Iron Removal from Water by Adsorption on Diatomaceous Earth,
W77-00155 5F

DIELDRIN
Chlorinated Hydrocarbon Pesticides in Western North Atlantic Ocean,
W77-00325 5B

DIETS
Structure of the Mandibles in the Genus Calanus S.L. in Relation to Latitudinal Zonality,
W77-00396 5C

DIFFUSE AGRICULTURAL POLLUTION
A Systematic Procedure for Taxing Agricultural Pollution Sources,
W77-00314 5G

DIFFUSE POLLUTION SOURCES
Coliform Bacteria from Diffuse Sources as a Factor in Estuarine Pollution,
W77-00359 5B

DIFFUSION
Role of Eddy Diffusivity in Thermocline Formation,
W77-00139 2H

Analytical Solution for 3-D Diffusion Model,
W77-00141 5B

Variations in Picloram Leaching Patterns for Several Soils,
W77-00476 2G

DIGESTION
Energy Conservation Practices in Municipal Sludge Management,
W77-00018 5D

DIGESTION TANKS
Powdered Activated Carbon Improves Anaerobic Digestion,
W77-00067 5D

DIKSON BAY (USSR)
Zooplankton of Dikson Bay (Kara Sea),
W77-00395 5C

DIPTERA
Change of Benthic Complexes Under the Effect of Overgrowth in Eutrophic Lake Baltym, (In Russian),
W77-00140 5C

DIPTERA

Larval Populations of Chironomidae in the Periphyton of the Yugoslav Part of the Danube Between Biograd and Tekija, (In German),
W77-00413 5C

Changes in the Chironomid Fauna Caused by Damming the Danube, (In German),
W77-00414 5C

DIRECT DRILLING (CROPS)
Effect of Ploughing and Direct Drilling on Soil Nitrate Content,
W77-00305 2G

DISCHARGE (WATER)
Float Calibration in Integrated-Float Techniques,
W77-00088 7B

Development of a Standard Rating for the Price Pygmy Current Meter,
W77-00432 7B

DISINFECTION
Agricultural Runoff as a Source of Halomethanes in Drinking Water,
W77-00163 5B

Comparative Studies on the Action of Chlorine and Ozone on Polioviruses in the Reprocessing of Drinking Water in Essen, (In German),
W77-00419 5F

Effect of Sprinkling Pastures with Potato Starch Factory Waste Effluents on Quality of Raw Milk, and Development of a Process for Removal of Protein, Amino Acids and Potassium from Wastes. (In Japanese)
W77-00420 5D

DISPERSANTS
The Toxicity Testing of Oils and Dispersants: A European View,
W77-00229 5G

DISPERSION
Analytical Solution for 3-D Diffusion Model,
W77-00141 5B

Development of the 'Next Generation' Chemical Dispersants,
W77-00227 5G

Factors Governing the Fate of Oil at Sea: Variations in the Amounts and Types of Dissolved or Dispersed Materials During the Weathering Process,
W77-00250 5B

Similarity of the Mean Motion of Fluid Particles Dispersing in a Natural Channel,
W77-00371 5B

Measurements of Estuary Dispersion Coefficients,
W77-00381 5B

DISPOSAL AREAS
Mathematical Model for Predicting the Consolidation of Dredged Material in Confined Disposal Areas,
W77-00167 5B

DISSOLVED SOLIDS
The Influence of Hydrological Conditions on Dissolved and Suspended Constituents in the Missouri River,
W77-00184 5C

DISTILLATION
Pyrolysis of Sewage Sludge,
W77-00024 5E

Sludge Pyrolysis for Energy Recovery and Pollution Control,
W77-00025 5E

DISTRIBUTING CHANNELS
Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

DISTRIBUTION
Some Differences Between Distributing and Braiding Channels,
W77-00376 2E

DISTRIBUTION PATTERNS
Number, Generation Time and Production of Bacteria in Water of the Saratov Reservoir, (In Russian),
W77-00143 5C

Chlorinated Hydrocarbon Pesticides in Western North Atlantic Ocean,
W77-00325 5B

Link Slope Distribution in Channel Networks,
W77-00370 2A

DJERDAP RESERVOIR
Events in the Djerdap Reservoir Immediately After Impoundment, (In German),
W77-00409 2H

DNIEPER RIVER
Effect of the Discharge Waters of the Tripol'e Thermal Electric Station of the Thermal Regime of the Dnieper, (In Russian),
W77-00408 5C

DNIEPER RIVER (USSR)
Change of the Biochemical Composition of Mussels Under Conditions of Regulated Flow of the Dnieper, (In Russian),
W77-00281 5C

DOMESTIC WASTES
Characteristics of Rural Household Wastewater,
W76-00048 5A

Basf Completes Ten-Year Project for Cleaning up the Rhine,
W77-00403 5D

DOMESTIC WATER
Characteristics of Rural Household Wastewater,
W76-00048 5A

DOUBLE SAMPLING THEORY
Total Nitrogen Using a Sodium Hydroxide Index and Double Sampling Theory,
W77-00297 2G

DRAIN OIL DISPOSAL
Drain Oil Disposal in Wisconsin,
W77-00209 5G

DRAINAGE
Source and Tributary-Source Link Lengths in Natural Channel Networks,
W77-00084 8B

Economics of Increased Mobility from Tile Drainage,
W77-00313 3F

Performance and Evaluation of Combined Mole-Tile Drain System in Heavy Soils,
W77-00316 4A

Effect of Agricultural Drainage on Water Quality,
W77-00475 5B

DRAINAGE EFFECTS
Performance and Evaluation of Combi
Mole-Tile Drain System in Heavy Soils,
W77-00316

DRAINAGE ENGINEERING
Economics of Increased Mobility from
Drainage,
W77-00313

DRAINAGE PATTERNS (GEOLOGIC)
Source and Tributary-Source Link Length
Natural Channel Networks,
W77-00084

DRAINAGE PRACTICES
Performance and Evaluation of Combi
Mole-Tile Drain System in Heavy Soils,
W77-00316

DRAINAGE SYSTEM
Performance and Evaluation of Combi
Mole-Tile Drain System in Heavy Soils,
W77-00316

DRAINAGE SYSTEMS
Sludge Drying Beds are Practical, Part 1,
W77-00039

Tunnelling Machine Used for Drain Tunnel
Roundhill Sewage Treatment Works Bre
Record.
W77-00069

Economics of Increased Mobility from
Drainage,
W77-00313

Link Slope Distribution in Channel Network
W77-00370

DRAINS
Economics of Increased Mobility from
Drainage,
W77-00313

Performance and Evaluation of Combi
Mole-Tile Drain System in Heavy Soils,
W77-00316

DRAWDOWN
Changes in the Water Supply in the Up
Republican Natural Resources Distu
Southwest Nebraska, from 1952-75,
W77-00489

DREDGED AREAS
Mathematical Model for Predicting the C
solidation of Dredged Material in Confi
Disposal Areas,
W77-00167

DREDGING
Mathematical Model for Predicting the C
solidation of Dredged Material in Confi
Disposal Areas,
W77-00167

Tertiary Treatment and Reuse of Animal Wastes,
W77-00158 5D

FARMS
Wastewater Sludge as a Fertilizer Substitute,
W77-00046 5E

FATTY ACIDS
Volatile Fatty Acids in Bottom Deposits of the Rybinsk Reservoir, (In Russian),
W77-00126 5C

FAUNA
Potamogeton Perfoliatus in a Brackish-Water Estuary at Ora, Fredrikstad (S. Norway), (In Norwegian),
W77-00508 5C

FEASIBILTY STUDIES
Alternatives for Disposal for the Metropolitan Denver Sewage Disposal District No. 1,
W77-00017 5E

FECAL COLIFORM
Coliform Bacteria from Diffuse Sources as a Factor in Estuarine Pollution,
W77-00359 5B

FEDERAL LAWS
Some Thoughts on Zero Discharge,
W77-00125 5G

FEED LOTS
Nitrogen in Soil Cores and Ground Water Under Abandoned Cattle Feedlots,
W77-00365 5B

FEEDING RATES
Seasonal Activity and Environmental Control of Foraging of the Subterranean Termite, Heterotermes Aureus (Snyder), in a Desert Grassland,
W77-00515 2I

FERMENTATION
Chemical-Technological Control of (Effluent) Purification Equipment (Khimiko-tekhnologicheskii kontrol' na ochistnykh sooruzheniyakh),
W77-00327 5D

FERRUGINOUS SOLONCHAK
Origin and Use of Rudyak Soils, Ferruginous Solonchaks of the Taiga Zone, (In Russian),
W77-00511 2G

FERTILIZATION
Variations in the Natural Abundance of N of Wheat Plants in Relation to Fertilizer Nitrogen Applications,
W77-00292 3F

Qualitative Composition of the Suspended Sediments of the Ordzhonikidze Irrigation System, (In Russian),
W77-00497 2J

FERTILIZER EXCISE TAX
A Regional Market for Rights to User Fertilizer as a Means of Achieving Water Quality Standards,
W77-00173 5G

FERTILIZER RIGHTS
A Regional Market for Rights to User Fertilizer as a Means of Achieving Water Quality Standards,
W77-00173 5G

FERTILIZERS
Wastewater Sludge as a Fertilizer Substitute,
W77-00046 5E

Wastes Find Fertile Field as Low-Cost Plant Nutrients,
W77-00050 5E

Disposition of Fertilizer Nitrate Applied to a Swelling Clay Soil in the Field,
W77-00144 5B

Surface Runoff Losses of Fertilizer Elements,
W77-00165 5B

A Regional Market for Rights to User Fertilizer as a Means of Achieving Water Quality Standards,
W77-00173 5G

Variations in the Natural Abundance of N of Wheat Plants in Relation to Fertilizer Nitrogen Applications,
W77-00292 3F

FILTER BACKWASHING
Flow Approaching Filter Washwater Troughs,
W77-00053 5D

FILTERS
Flow Approaching Filter Washwater Troughs,
W77-00053 5D

FILTRATION
Cross-Flow Filtration in Physical-Chemical Treatment of Municipal Sewage Effluents,
W77-00042 5D

Flow Approaching Filter Washwater Troughs,
W77-00053 5D

Polymers Play Increased Role in Water Clarification,
W77-00082 5D

FISH
Presence of Spring and Winter Races of the Nelma in the OB River, (In Russian),
W77-00057 2I

Effect of Irrigation Pumping on Desert Pupfish Habitats in Ash Meadows, Nye County, Nevada,
W77-00427 8I

Feeding of Sheefish in the Upper Ob Above the Dam of the Novosibirsk Hydroelectric Station, (In Russian),
W77-00522 2I

FISH DIETS
Diet of Hippoglossina Macrops (Steindachner) in Mejillones (Pisces, Bothidae), (IN Spanish),
W77-00502 2L

Role of Predatory Cladocera in the Feeding o
the Charkhal Kilka Clupeonella Delicatu
lacaspia Morpha Tscharchalensis (Borodin) i
Kuibyshev Reservoir, (In Russian),
W77-00520 2

Feeding of Sheefish in the Upper Ob Above th
Dam of the Novosibirsk Hydroelectric Statio
(In Russian),
W77-00522 2

FISH EGGS
Chromosome Mutagenesis in Developin
Mackerel Eggs Sampled from the New Yor
Bight,
W77-00274 5

FISH FOOD ORGANISMS
Role of Predatory Cladocera in the Feeding
the Charkhal Kilka Clupeonella Delicat
lacaspia Morpha Tscharchalensis (Borodin)
Kuibyshev Reservoir, (In Russian),
W77-00520 2

FISH GENETICS
Fishery and Biology of Metapenaeu
Monoceros (Fabricius) from the Godava
Estuarine System,
W77-00424 2

FISH HARVEST
Forecasts of Atlantic and Gulf Menhade
Catches Based on the Historical Relation
Catch and Fishing Effort,
W77-00388 6

FISH MANAGEMENT
Fisheries Management and Social Context: Th
Case of the Maine Lobster Fishery,
W77-00383 6

Status of the Gulf and Atlantic Manhade
Fisheries and Implications for Resour
Management,
W77-00389 6

Decision-Making in Recreational Fisheri
Management: an Analysis,
W77-00391 6

FISH PHYSIOLOGY
Ecological and Physiological Patterns
Polyartemia Forcipata (Anostraca) from Tu
dra Water Bodies of the East Murman, (In Ru
sian),
W77-00525

FISH POPULATIONS
Evolutionary Aspect of the Reproducti
Evology of Salmon of the Genus Salmo
Some Water Bodies of Kamchatka, (In Ru
sian),
W77-00519

Feeding of Sheefish in the Upper Ob Above t
Dam of the Novosibirsk Hydroelectric Statio
(In Russian),
W77-00522

FISH PREY
Causes of a Greater Effect of Predators
Non-Predatory Fish Populations in Lo
Latitudes, (In Russian),
W77-00521

FISH REPRODUCTION
Fecundity of Nelmuschka Coregon
Lavaretus Nelmuschka Pravdin and Its Ecolo
ical Background, (In Russian),
W77-00518 2

Feeding of Sheefish in the Upper Ob Above the Dam of the Novosibirsk Hydroelectric Station, (In Russian),
W77-00522 2I

SH STOCKING
Change of Benthic Complexes Under the Effect of Overgrowth in Eutrophic Lake Baltym, (In Russian),
W77-00140 5C

SHERIES
Effects on Commercial Fishing of Petroleum Development off the Northeastern United States,
W77-00280 5C

SHKILL CREEK (NY)
Floodflow Characteristics at Proposed Bridge Site on Fishkill Creek, Fishkill, New York,
W77-00483 4C

ORDS
Vertical Diffusion Driven by Internal Waves in a Sill Fjord,
W77-00360 2L

EXURAL STRENGTH
Flexural Strength of Lake Ice in Relation to Its Growth Structure and Thermal History,
W77-00354 2C

OATS
Float Calibration in Integrated-Float Techniques,
W77-00088 7B

OCCULATION
Physical-Chemical Treatment Improves Iran's Urban Runoff,
W77-00077 5D

Process for Purifying Industrial Waste Waters (Procede d'epuration d'eaux usees industrielles).
W77-00342 5D

OOD CONTROL
Using Linear Programming to Evaluate Agricultural Flood Control Projects,
W77-00180 3F

OOD DATA
Floods of March-April 1973 in Southeastern United States,
W77-00434 2E

OOD DISCHARGE
Floodflow Characteristics at Proposed Bridge ite on Fishkill Creek, Fishkill, New York,
W77-00483 4C

OOD FLOW
Floodflow Characteristics at Proposed Bridge ite on Fishkill Creek, Fishkill, New York,
/77-00483 4C

OOD FREQUENCY
lagnitude and Frequency of Floods in North arolina: Technique for Estimating the Magitude and Frequency of Floods on Natural treams in North Carolina,
'77-00480 2E

OOD PLAIN MANAGEMENT
lood Plain Information: Report on Rancocas reek, Burlington County, NJ (Summary Reort).
'77-00102 4A

FLOOD PLAINS
Flood Hazard Analysis: Crooked River, Town of Casco, Town of Naples, Cumberland County, Maine,
W77-00100 4A

Flood Plain Information: Report on Rancocas Creek, Burlington County, NJ (Summary Report).
W77-00102 4A

Flood Plain Information: Southampton County, Virginia.
W77-00104 4A

Flood Plain Information: Resurrection River and Salmon Creek, Alaska.
W77-00105 4A

FLOOD PROFILES
Flood Hazard Analysis: Crooked River, Town of Casco, Town of Naples, Cumberland County, Maine,
W77-00100 4A

Flood Plain Information: Report on Rancocas Creek, Burlington County, NJ (Summary Report).
W77-00102 4A

Flood Plain Information: Southampton County, Virginia.
W77-00104 4A

Flood Plain Information: Resurrection River and Salmon Creek, Alaska.
W77-00105 4A

FLOOD RECURRENCE INTERVAL
Floodflow Characteristics at Proposed Bridge Site on Fishkill Creek, Fishkill, New York,
W77-00483 4C

FLOOD STAGES
Flood Plain Information: Southampton County, Virginia.
W77-00104 4A

Maximum Known Stages and Discharges of New York Streams Through 1973,
W77-00485 7C

FLOODS
Flood Hazard Analysis: Crooked River, Town of Casco, Town of Naples, Cumberland County, Maine,
W77-00100 4A

Flood Plain Information: Report on Rancocas Creek, Burlington County, NJ (Summary Report).
W77-00102 4A

Flood Plain Information: Resurrection River and Salmon Creek, Alaska.
W77-00105 4A

Mathematical Model for Predicting the Consolidation of Dredged Material in Confined Disposal Areas,
W77-00167 5B

Floods of March-April 1973 in Southeastern United States,
W77-00434 2E

Magnitude and Frequency of Floods in North Carolina: Technique for Estimating the Magnitude and Frequency of Floods on Natural Streams in North Carolina,
W77-00480 2E

FLORA
Potamogeton Perfoliatus in a Brackish-Water Estuary at Ora, Fredrikstad (S. Norway), (In Norwegian),
W77-00508 5C

FLORIDA
Inter-Plan Communication and Motivation Study, Final Report, Florida Background Study,
W77-00098 6B

The Transmission and Decay of Barotropic Topographic Rossby Waves Incident on a Continental Shelf,
W77-00132 2L

Continental Shelf Waves in the Florida Straits,
W77-00133 2L

Ground-Water Quality in the Davie Landfill, Broward County, Florida,
W77-00486 5B

FLORIDA PHOSPHATE ROCK
The Activity Concept of Phosphate-Rock Solubility,
W77-00290 2K

FLORIDA STRAITS
Continental Shelf Waves in the Florida Straits,
W77-00133 2L

FLOW
Equalization of Time Variable Waste Loads,
W77-00052 5D

Flow Approaching Filter Washwater Troughs,
W77-00053 5D

On the Flow Through Barrow Canyon,
W77-00134 2L

Similarity of the Mean Motion of Fluid Particles Dispersing in a Natural Channel,
W77-00371 5B

FLOW CHARACTERISTICS
Mean Annual Runoff in the Upper Ohio River Basin, 1941-70, and its Historic Variation,
W77-00428 2E

FLOW CONTROL
Urban Stormwater Detention and Flow Attenuation,
W77-00078 5D

FLOW MEASUREMENT
Development of a Standard Rating for the Price Pygmy Current Meter,
W77-00432 7B

FLOW METERS (WATER)
Development of a Standard Rating for the Price Pygmy Current Meter,
W77-00432 7B

FLUORESCENCE SPECTROSCOPY
Comparative Identification of Oil Spills by Fluorescence Spectroscopy Fingerprinting,
W77-00224 5A

FOG
Project Fog Drops V - Task I: A Numerical Model of Advection Fog, Task II: Recommendations for Simplified Individual Zero-Gravity Cloud Physics Experiments,
W77-00357 2B

FOOD CHAINS
Plant Uptake of Heavy Metals from Sewage Sludge Applied to Land,
W77-00028 5D

Causes of a Greater Effect of Predators on Non-Predatory Fish Populations in Low Latitudes, (In Russian),
W77-00521 2I

FORAGING
Seasonal Activity and Environmental Control of Foraging of the Subterranean Termite, Heterotermes Aureus (Snyder), in a Desert Grassland,
W77-00515 2I

FORAMINIFERS
Distribution of Benthonic Foraminifers Off the Western Coast of South America, (In Russian),
W77-00496 2L

FORECASTING
Long-Range Forecasting of Maximum Ice Extent on the Great Lakes,
W77-00276 2C

Forecasts of Atlantic and Gulf Menhaden Catches Based on the Historical Relation of Catch and Fishing Effort,
W77-00388 6C

FOREST MANAGEMENT
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

FOREST SOILS
Origin and Use of Rudyak Soils, Ferruginous Solonchaks of the Taiga Zone, (In Russian),
W77-00511 2G

Study of the Erosion Stability of the Plow Layers of Gray Forest Soils of the Northern Forest-Steppe, (In Russian),
W77-00514 4D

FOREST WATERSHEDS
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

Factors Affecting Spring Runoff on Two Forested Watersheds,
W77-00374 2E

FORESTS
The Broadleaf Evergreen Forests of Japan, (In German),
W77-00499 4A

FORT RIVER (MASS)
Fort River Ecosystem: Productivity of the Periphyton Component,
W77-00149 5C

FOSSIL FUELS
Environment, Energy, and Capital in the Fossil Fueled Electric Power Industry,
W77-00118 3E

FOX RIVER (WISC)
State of Wisconsin Automatic Water Quality Monitoring System for the Fox and Wisconsin Rivers,
W77-00334 5A

FRANCE
Benthic Bionomy of the Continental Shelf of the French Catalonian Coast: 8. Macrofauna and Meiofauna, Quantitative and Biocenotic Relations, (In French),
W77-00516 2L

FRASER ESTUARY (BC)
Measurements of Estuary Dispersion Coefficients,
W77-00381 5B

FREE ENERGY
On The Fracture Properties of Snow,
W77-00083 2C

FREEZING
Evaluation of Techniques for Long-Range Forecasting of Air Temperature and Ice Formation,
W77-00275 2C

FREQUENCY ANALYSIS
The Use of Continuous Simulation in the Evaluation of Water Quality Management Plans,
W77-00001 5G

The Variability of Monthly Rainfall in South Australia,
W77-00443 2B

Magnitude and Frequency of Floods in North Carolina: Technique for Estimating the Magnitude and Frequency of Floods on Natural Streams in North Carolina,
W77-00480 2E

FRESHWATER
Manganese in Fresh Waters, (In Russian),
W77-00405 5A

FRESHWATER ANIMALS
Introduction to the Knowledge of Freshwater Invertebrates and Their Environment, (In Dutch),
W77-00410 2I

FRESHWATER FISH
Morpho-Ecological Characteristics of the Ide, Leuciscus Idus (Linne), from the Kremenchug Reservoir. (In Russian),
W77-00504 2H

FRESHWATER MARSHES
A Four-Year Analysis of Vegetation Following an Oil Spill in a Freshwater Marsh,
W77-00147 5C

FUCUS-VESTICULOSUS
Variability of Amino Acid Composition of Algae Inhabiting the Zone of Variable Salinity, (In Russian),
W77-00345 5A

FUELS
Environmental Factors in Producing Supplemental Fuels,
W77-00390 6G

GAMMARUS OCEANICUS
Effects of Oil on the Reproduction of the Amphipod Gammarus Oceanicus,
W77-00188 5C

GAS CHROMATOGRAPHY
Trace Organic Components as Fingerprints in Gas Chromatographic Identification of Spilled Asphalts,
W77-00085 5A

Carcinogenic Nitrosamines and Their Precursors in Fresh and Polluted Waters,
W77-00146 5A

Identification of Oil Pollutants: A Review of Some Recent Methods,
W77-00221 5A

Determination of Vinyl Chloride at Micrograms/Liter Level in Water by Gas Chromatography,
W77-00326 5A

GASOLINE
The Response of Macroinvertebrates Gasoline Pollution in a Mountain Stream,
W77-00268

GELBSTOFF
Yellow Substance (Gelbstoff) and its Contrib tion to the Attenuation of Photosynthetica Active Radiation in some Inland and Coas South-Eastern Australian Waters,
W77-00448

GELS
Engineering Study of an Oil Gellati Technique to Control Spills from Distress Tankers,
W77-00228

GENETIC DAMAGE
Chromosome Mutagenesis in Develop Mackerel Eggs Sampled from the New Y Bight,
W77-00274

GEOGRAPHIC REGIONS
Geographical Variability of Some Species the Family Oithonidae (Copepoda, Cyc poida),
W77-00400

GEOLOGIC INVESTIGATIONS
Chemical Weathering of Glauconite,
W77-00289

GEOMORPHOLOGY
Appendix 4, Limnology of Lakes and Emb ments, Great Lakes Basin Framework Study
W77-00358

Geomorphological Mapping Applied to Erosion Evaluation,
W77-00369

Adjustment of Stream-Channel Shape Hydrologic Regime,
W77-00379

GEORGIA
Capacity of a Spartina Salt Marsh to Assimi Nitrogen from Secondarily Treated Sewage,
W77-00003

GS/MS (Gas Chromatographic/Mass Sp trometric) Analyses of Organic Compound Treated Kraft Paper Mill Wastewaters,
W77-00456

GEOSMIN
Isolation and Identification of Blue-Gr Algae Producing Muddy Odor Metaboli Geosmin, and 2-Methylisoborneol, in Sa Lakes in Manotoba,
W77-00185

GERMINATION
Effect of Osmotic Suction on the Germina of Warm Season Grasses, (In Japanese),
W77-00422

Effect of Soil Water Suction on the Germ tion and Emergence of Warm Season Gras (In Japanese),
W77-00423

GLAUCONITE
Chemical Weathering of Glauconite,
W77-00289

GLYCYRRHIZA-GLABRA
Water Relations of Glycyrrhiza Glabra Under Desert Conditions,
W77-00500

OVERNMENTAL INTERRELATIONS
Regional Wastewater Solids Management Program Los Angeles-Orange County Metropolitan Area,
W77-00011 5E

RADUATE EDUCATION
Graduate Education Opportunities in Water Resources in the State of Minnesota.
W77-00156 9A

RAHAM'S BIOTIC INDEX
Biological Assessment of Water Quality in Three British Rivers: The North ESK (Scotland), The Ivel (England) and the TAF (Wales),
W77-00108 5A

RANITES
Hydrogeochemistry of the Genoa River Basin, New South Wales - Victoria (Australia),
W77-00452 2K

RASSES
Effect of Osmotic Suction on the Germination of Warm Season Grasses, (In Japanese),
W77-00422 2I

Effect of Soil Water Suction on the Germination and Emergence of Warm Season Grasses, (In Japanese),
W77-00423 2I

Water Balance of Stipa Pennata Spp. Eriocaulis, Stipa Capillata and Festuca Vallesiace in the Steppe Region of the Upper Vinschagau, In Germany9,
W77-00505 2D

RASSLANDS
Water Balance of Stipa Pennata Spp. Eriocaulis, Stipa Capillata and Festuca Vallesiace in the Steppe Region of the Upper Vinschagau, In Germany9,
W77-00505 2D

Light-Chestnut Long-Irrigated Soil of the Sharur Plain, (In Russian),
W77-00510 2G

RAVELS
Marine Sand and Gravel Mining,
W77-00195 3E

RAZING
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

REAT BEND PRAIRIE (KANS)
Hydrogeologic Data from the Great Bend Prairie, South-Central Kansas,
W77-00426 4B

REAT LAKES
Evaluation of Techniques for Long-Range Forecasting of Air Temperature and Ice Formation,
W77-00275 2C

Long-Range Forecasting of Maximum Ice Extent on the Great Lakes,
W77-00276 2C

REAT LAKES REGION
Appendix 4, Limnology of Lakes and Embayments, Great Lakes Basin Framework Study.
W77-00358 2H

REENLAND SEA
Numerical Simulation of the Arctic Ocean Circulation,
W77-00129 2L

GROUNDWATER
Impact of Land Disposal of Sludges on Groundwater,
W77-00031 5B

Nitrogen in Soil Cores and Ground Water Under Abandoned Cattle Feedlots,
W77-00365 5B

Towards A Computer-Based Information-Retrieval System for Groundwater Data,
W77-00377 7C

Sodium Carbonate in Ground Waters of the Turkmen SSR, (In Russian),
W77-00384 3C

Effect of Irrigation Pumping on Desert Pupfish Habitats in Ash Meadows, Nye County, Nevada,
W77-00427 8I

Ground-Water Levels in the United States, 1970-74: South-Central States.
W77-00430 4B

Water Resources Data for Alabama, Water Year 1975.
W77-00435 7C

Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1975,
W77-00479 4B

GROUNDWATER MOVEMENT
Ground-Water Quality in the Davie Landfill, Broward County, Florida,
W77-00486 5B

GROUNDWATER RESOURCES
Hydrogeologic Data from the Great Bend Prairie, South-Central Kansas,
W77-00426 4B

Digital-Model Analysis to Predict Water Levels in a Well Field Near Columbus, Indiana,
W77-00482 4B

Ground-Water Data for Attala County, Mississippi,
W77-00484 7C

Changes in the Water Supply in the Upper Republican Natural Resources District, Southwest Nebraska, from 1952-75,
W77-00489 4B

GROWTH RATES
Feeding of Sheefish in the Upper Ob Above the Dam of the Novosibirsk Hydroelectric Station, (In Russian),
W77-00522 2I

GUAIACOLS
Identification of Two Chlorinated Guaiacols in Kraft Bleaching Wastewaters,
W77-00459 5A

GUAICOLS
(Chlorinated Guaiacols in Bleachery Wastes--) Response to the Comments of I. H. Rogers,
W77-00468 5A

GULF COAST
United States Coast Pilot 5 - Atlantic Coast from Gulf of Mexico, Puerto Rico, and Virgin Islands,
W77-00279 4A

GULF MENHADEN
Forecasts of Atlantic and Gulf Menhaden Catches Based on the Historical Relation of Catch and Fishing Effort,
W77-00388 6C

Status of the Gulf and Atlantic Manhaden Fisheries and Implications for Resource Management,
W77-00389 6C

GULF OF MEXICO
United States Coast Pilot 5 - Atlantic Coast from Gulf of Mexico, Puerto Rico, and Virgin Islands,
W77-00279 4A

GULF STREAM
Continental Shelf Waves in the Florida Straits,
W77-00133 2L

Geographical Variability of the Internal Wave Field: A Search for Sources and Sinks,
W77-00135 2L

An Investigation of a Cold Eddy on the Eastern Side of the Gulf Stream Using NOAA 2 and NOAA 3 Satellite Data and Ship Data,
W77-00364 2L

GULLIES
Gully Development and Control: The Status of Our Knowledge,
W77-00097 2J

GULLY CONTROL SYSTEMS
Gully Development and Control: The Status of Our Knowledge,
W77-00097 2J

GULLY EROSION
Gully Development and Control: The Status of Our Knowledge,

GULLY GROWTH MODELS
Gully Development and Control: The Status of Our Knowledge,
W77-00097 2J

GULLY PROCESSES
Gully Development and Control: The Status of Our Knowledge,
W77-00097 2J

HALOMETHANES
Agricultural Runoff as a Source of Halomethanes in Drinking Water,
W77-00163 5B

HALOPHYTES
Proximate Nutritive Value Changes During Decomposition of Salt Marsh Plants,
W77-00402 5C

HARBORS
Seabed Drifter Movement in San Diego Bay and Adjacent Waters,
W77-00356 5B

HAWAII
Variations in Picloram Leaching Patterns for Several Soils,
W77-00476 2G

HAZARDOUS CHEMICALS
Remote Detection of Water Pollutants by Computerized Laser-Raman Spectroscopy,
W77-00154 5A

HAZARDS
FDA's Overview of the Potential Health Hazards Associated with the Land Application of Municipal Wastewater Sludges,
W77-00034 5E

HEAT EXCHANGE COEFFICIENT
A Nomogram to Estimate the Heat-Exchange Coefficient at the Air-Water Interface as a Function of Wind Speed and Temperature; A Critical Survey of Some Literature,
W77-00130 2D

HEAT EXCHANGERS
A Nomogram to Estimate the Heat-Exchange Coefficient at the Air-Water Interface as a Function of Wind Speed and Temperature; A Critical Survey of Some Literature,
W77-00130 2D

HEAVY METALS
Environmental Impact of Cadmium and Other Heavy Metals from Land-Applied Sewage Sludge,
W77-00002 5C

Plant Uptake of Heavy Metals from Sewage Sludge Applied to Land,
W77-00028 5D

Re-Assessment of Chelating Ion-Exchange Resins for Trace Metal Analysis of Sea Water,
W77-00320 5A

The Determination of Zinc, Cadmium, Lead and Copper in a Single Sea-Water Sample by Differential Pulse Anodic Stripping Voltammetry,
W77-00321 5A

Trace-Metal Levels in the Waters and Sediments of Corio Bay (Australia),
W77-00446 5A

HETEROTERMES-AUREUS
Seasonal Activity and Environmental Control of Foraging of the Subterranean Termite, Heterotermes Aureus (Snyder), in a Desert Grassland,
W77-00515 2I

HETEROTROPHS
Modeling of the Transformation of Nitrogen Compounds in a Closed Aquatic Chemical-Ecological Microsystem, (In Russian),
W77-00494 5B

HIPPOGLOSSINA-MACROPS
Diet of Hippoglossina Macrops (Steindachner) in Mejillones (Pisces, Bothidae), (IN Spanish),
W77-00502 2L

HUDSON BAY LOWLANDS
A Simple Method for Determining the Evaporation from Shallow Lakes and Ponds,
W77-00127 2D

HUMAN DISEASES
Hygienic Aspects of Microbial Contamination of Water Basins, (In Russian),
W77-00454 5B

HUMUS
Dynamics of the Composition and the Qualities of Water-Soluble Organic Substance During the Composting of Clover and Timothy Roots, (In Russian),
W77-00062 5B

HURRICANE AGNES
Environmental Impact of Stream Channelization,
W77-00375 6G

HURRICANES
Tropical Storm Agnes Pennsylvania's Torrey Canyon,
W77-00256 5G

HYDRAULIC CONDUCTIVITY
Hydraulic Conductivity in Surface Active Soils,
W77-00441 2G

Method of Simultaneous Determination of Water Conductivity of Soils and Plants, (In Russian),
W77-00512 2I

HYDRAULIC CONTROL FORMULA
Evaluation of Activated Sludge Control Techniques Through Pilot Plant and Computer Analyses,
W77-00157 5D

HYDRAULIC STRUCTURES
Sewering The City of New York,
W77-00070 5D

Maine Sewer Bid 39% Below Estimate.
W77-00071 5D

A Retrospective on the Structural Stability of RCC Spun Sewer Pipes,
W77-00073 5D

Sewer Force Main Helps Solve Pollution Problem.
W77-00075 5D

Kaministiquia Interceptor Sewer Completed in Thunder Bay.
W77-00076 5D

HYDRAULICS
Functional Design of Sanitary Sewers,
W77-00068 5D

Stochastic Considerations in Thunderstorm Modeling,
W77-00087 2B

Energy Gradient Line for Drip Irrigation Laterals,
W77-00318 3F

HYDRODYNAMICS
Biohydrodynamic Channel for Field Trips, (In Russian),
W77-00417 7B

HYDROGEN ION CONCENTRATION
Formation of Chemical and Biological Denitrification Products in Flooded Soil at Controlled pH and Redox Potential,
W77-00308 2G

HYDROGRAPHS
The Generation of Runoff from Subarctic Snowpacks,
W77-00372 2C

HYDROLOGIC BOUNDARIES
Hydrologic Unit Map--1974, State of Iowa
W77-00425 7C

Hydrologic Unit Map--1974, State of Wyoming.
W77-00429 7C

HYDROLOGIC DATA
Similarity of the Mean Motion of Fluid Particles Dispersing in a Natural Channel,
W77-00371 5B

Hydrogeologic Data from the Great Bend Prairie, South-Central Kansas,
W77-00426 4B

Surface Water Supply of the United State
1966-70: Part 4. St. Lawrence River Basin
Volume 2. St. Lawrence River Basin Belo
Lake Huron.
W77-00431 4

Water Resources Data for Alabama, Wat
Year 1975.
W77-00435 7

HYDROLOGIC ENGINEERING
Hydrologic Engineering Methods for Wat
Resources Development, Volume 3, Hydrolo
ic Frequency Analysis,
W77-00169 A

HYDROLYSIS
Hydrolysis of Press Waste Waters from
Manufacture of Fiber (Insulation) Boa
(Contributii la studiul procesului de hidroli
apelor de presa din circuitul de fabricati
P.F.L.),
W77-00324

Chemical-Technological Control of (Efflu
Purification Equipment (Khimiko-te
nologicheskii kontrol' na ochistnykh soo
heniyakh),
W77-00327

HYDRORHIZAL COLONIES
On the Influence of Water Currents on
Growth of Hydrorhizal Colonies, (In Germa
W77-00506

HYDROSTATIC PRESSURE
Effect of Porosity on the Hydrostatic Comp
sion of Ice,
W77-00355

ICE
Behavioral Characteristics and Clea
Techniques of North Slope Crude Oil in
Arctic Winter Environment,
W77-00230

Lake Champlain: A Case History on the Cleanup of No. 6 Fuel through Five Feet of Solid Ice at Near-Zero Temperatures,
W77-00257 5G

Long-Range Forecasting of Maximum Ice Extent on the Great Lakes,
W77-00276 2C

Flexural Strength of Lake Ice in Relation to Its Growth Structure and Thermal History,
W77-00354 2C

Effect of Porosity on the Hydrostatic Compression of Ice,
W77-00355 2C

ICE COMPRESSIBILITY
Effect of Porosity on the Hydrostatic Compression of Ice,
W77-00355 2C

ICE CRYSTALS
Final Report on an Investigation of Precipitating Ice Crystals from Natural and Seeded Winter Orographic Clouds,
W77-00096 3B

ICE FORECASTING
Evaluation of Techniques for Long-Range Forecasting of Air Temperature and Ice Formation,
W77-00275 2C

ICE FORMATION
Evaluation of Techniques for Long-Range Forecasting of Air Temperature and Ice Formation,
W77-00275 2C

ICED LAKES
Long-Range Forecasting of Maximum Ice Extent on the Great Lakes,
W77-00276 2C

IDE
Morpho-Ecological Characteristics of the Ide, Leuciscus Idus (Linne), from the Kremenchug Reservoir. (In Russian),
W77-00504 2H

ILYOCRYPTUS-SORDIDUS
Consumption of Organic Matter of Muds by Ilyocryptus Sordidus (Cladocera, Macrothricidae), (In Russian),
W77-00507 5C

IMPACT AREA ANALYSIS
Dams and People: Geographic Impact Area Analysis,
W77-00008 6B

IMPACT ASSESSMENT
An Overview of the Impact Study of the McClellan-Kerr Multiple Purpose Arkansas River System,
W77-00101 6G

Social Impact Assessment: An Overview,
W77-00103 6B

IMPOUNDMENTS
Events in the Djerdap Reservoir Immediately After Impoundment, (In German),
W77-00409 2H

INCINERATION
Sludge Disposal Alternatives for Boston,
W77-00016 5E

The Past, Present, and Future Prospects of Burning Municipal Sewage Sludge Along with Mixed Municipal Refuse,
W77-00021 5E

INDIA
Ecologically Balanced Community Wastewater Disposal Systems Management for Developing Countries,
W77-00066 5D

Fishery and Biology of Metapenaeus Monoceros (Fabricius) from the Godavari Estuarine System,
W77-00424 2L

INDIANA
Using Linear Programming to Evaluate Agricultural Flood Control Projects,
W77-00180 3F

Digital-Model Analysis to Predict Water Levels in a Well Field Near Columbus, Indiana,
W77-00482 4B

INDICATORS
Urban Watershed Management Using Activity Indicators to Predict Water Quality,
W77-00106 5A

INDUSTRIAL PLANTS
Offshore Industrial-Port Islands,
W77-00176 5G

INDUSTRIAL PRODUCTION
Environmental Factors in Producing Supplemental Fuels,
W77-00390 6G

INDUSTRIAL WASTES
Deposition of Airborne Mercury from Six Swedish Chlor-Alkali Plants Surveyed by Moss Analysis,
W77-00186 5A

Biological Purification of the Izmail Board Mill Effluents (Biologicheskaya ochistka stochnykh vod Izmail'skogo Tsellyulozno-Kartonnogo Kombinata),
W77-00322 5D

Diminution of Suspended Solids in Pulp and Paper Industry Effluents by Treatment with Chemical Coagulants (Diminuarea continutului de suspensii totale in apele reziduale din industria celulozei si hirtiei, prin tratarea cu agenti chimici coagulanti),
W77-00323 5D

Process for Purifying Industrial Waste Waters (Procede d'epuration d'eaux usees industrielles).
W77-00342 5D

Basf Completes Ten-Year Project for Cleaning up the Rhine,
W77-00403 5D

Effect of Sprinkling Pastures with Potato Starch Factory Waste Effluents on Quality of Raw Milk, and Development of a Process for Removal of Protein, Amino Acids and Potassium from Wastes. (In Japanese)
W77-00420 5D

INDUSTRIAL WATER
An Overview: So You Want to Recycle your Wastewater. How Should You Begin. Is it Feasible,
W77-00079 5D

INFILTRATION
Modeling Infiltration and Redistribution of Soil Water During Intermittent Application,
W77-00093 2G

Two-Dimensional Solutes Transfer During Nonsteady Infiltration: Laboratory Test of Mathematical Model,
W77-00288 2G

INFILTRATION RATES
Modeling Infiltration and Redistribution of Soil Water During Intermittent Application,
W77-00093 2G

INFLATION (ECONOMIC)
Coping with Increasing Costs,
W77-00172 3D

INFORMATION EXCHANGE
Effectiveness of Information Transfer Through Water Resources Researcher/User Group Interaction,
W77-00151 10D

Bibliography on Tidal Hydraulics, Supplementary Material Compiled from May 1971 to May 1974, ES 816, Tidal Flows in Rivers and Harbors.
W77-00353 2L

INFORMATION RETRIEVAL
User's Guide for Hydrologic Information Storage and Retrieval System,

The Nutrients and Plants of Lake Joondalup, a Mildly Eutrophic Lake Experiencing Large Seasonal Changes in Volume,
W77-00442 5C

Nutrient Economies and Trophic Status of Lakes Sorell and Crescent, Tasmania (Australia),
W77-00451 5C

Seasonal Succession and Vertical Distribution of Phytoplankton in Lake Hayes and Lake Johnson, South Island, New Zealand,
W77-00517 5C

Fecundity of Nelmuschka Coregonus Lavaretus Nelmuschka Pravdin and Its Ecological Background, (In Russian),
W77-00518 2H

LAKES MARION-MOULTRIE RESERVOIR (SC)
Lakes Marion-Moultrie Stream System Investigation: Part II-Simulation Studies,
W77-00488 4A

LAND RECLAMATION
Beware The Wrath Of Osiris,
W77-00177 4A

LAND SUBSIDENCE
One-Dimensional Simulation of Aquifer System Compaction near Pixley, California: 2. Stress-Dependent Parameters,
W77-00490 2F

LAND USE
Ecological Impact of the Disposal of Municipal Sludge Onto Land,
W77-00027 5E

Effects of Sewage Sludge or Effluent Application to Soil on the Movement of Nitrogen, Phosphorus, Soluble Salts and Trace Elements to Groundwaters,
W77-00029 5C

Environmental Effects of Sludge Disposal in Sanitary Landfills,
W77-00030 5C

Impact of Land Disposal of Sludges on Groundwater,
W77-00031 5B

FDA's Overview of the Potential Health Hazards Associated with the Land Application of Municipal Wastewater Sludges,
W77-00034 5E

A Computerized System for Wild Land Use Planning and Environmental Impact Assessment,
W77-00119 6G

LANDFILLS
Environmental Effects of Sludge Disposal in Sanitary Landfills,
W77-00030 5C

LARVAE
Larval Populations of Chironomidae in the Periphyton of the Yugoslav Part of the Danube Between Biograd and Tekija, (In German),
W77-00413 5C

LASER RAMAN SPECTROSCOPY
Remote Detection of Water Pollutants by Computerized Laser-Raman Spectroscopy,
W77-00154 5A

LATITUDINAL STUDIES
Structure of the Mandibles in the Genus Calanus S.L. in Relation to Latitudinal Zonality,
W77-00396 5C

LAW OF THE SEA
Management of the Ocean's Living Resources: An Essay Review,
W77-00179 6E

LAWRACEAE
The Broadleaf Evergreen Forests of Japan, (In German),
W77-00499 4A

LEACHING
Disposition of Fertilizer Nitrate Applied to a Swelling Clay Soil in the Field,
W77-00144 5B

Short Term Nitrate Losses and Associated Microbial Populations in Soil Columns,
W77-00309 2G

Variations in Picloram Leaching Patterns for Several Soils,
W77-00476 2G

LEACHING LOSSES
Disposition of Fertilizer Nitrate Applied to a Swelling Clay Soil in the Field,
W77-00144 5B

LEAD
Trace-Metal Levels in the Waters and Sediments of Corio Bay (Australia),
W77-00446 5A

LEAF PHOTOSYNTHESIS
Leaf Photosynthesis: The Influence of Environmental Variables,
W77-00302 2I

LEATHER
Process for Purifying Industrial Waste Waters (Procede d'epuration d'eaux usees industrielles).
W77-00342 5D

LEAVES
Leaf Photosynthesis: The Influence of Environmental Variables,
W77-00302 2I

LEGAL ASPECTS
A Sludge Policy for the 70's,
W77-00026 5E

LEGISLATION
Economic Impacts of State Environmental Programs in a National Framework: The Iowa Conservancy Law,
W77-00303 6G

The View of the Paper Industry on the Occurrence of PCB's in the Environment and the Need for Regulation,
W77-00461 5B

Statement Relating to Polychlorinated Biphenyls on Behalf of the Wisconsin Paper Council,
W77-00462 5B

Iowa's Experience with a Mandatory Sediment Control Law,
W77-00477 6E

LIGHT PENETRATION
Yellow Substance (Gelbstoff) and its Contribution to the Attenuation of Photosynthetically Active Radiation in some Inland and Coastal South-Eastern Australian Waters,
W77-00448 5C

LIGNINS
Secondary Degradation of Sulfite Mill Waste Water by Development of Algal Masses (Sekundaerabbau von Sulfitzellstoffabwasser durch Algen-Massenentwicklungen),
W77-00341 5D

Centrifuge Plus Lime Limits Lignin in Waste Water,
W77-00464 5D

LIME
Centrifuge Plus Lime Limits Lignin in Waste Water,
W77-00464 5D

LIMESTONES
Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1975,
W77-00479 4B

LIMNOLOGY
Appendix 4, Limnology of Lakes and Embayments, Great Lakes Basin Framework Study.
W77-00358 2H

LINDANE (GAMMA-HEXACHLOROCYCLOHEXANE)
Chlorinated Hydrocarbon Pesticides in Wes
North Atlantic Ocean,
W77-00325

LINEAR PROGRAMMING

LINK SLOPE
Link Slope Distribution in Channel Netwo
W77-00370

LIQUID WATER CONTENT
Measurements of Liquid Water Conte
Winter Cloud Systems Over the Sierra Ne
W77-00164

LITTORAL
Littoral Zooplankton of the Baikal Open
(In Russian),
W77-00333

Possibilities of Determining Community
daries Within the Limits of a Lake Ecosy
(In Russian),
W77-00367

LOCH EIL (SCOTLAND)
The Benthic Ecology of Loch Linnhe and
Eil, A Sea-Loch System on the West Co
Scotland. IV. Changes in the Benthic Fau
tributable to Organic Enrichment,
W77-00196

LOCH LINNHE (SCOTLAND)
The Benthic Ecology of Loch Linnhe and
Eil, A Sea-Loch System on the West Co
Scotland. IV. Changes in the Benthic Fau
tributable to Organic Enrichment,
W77-00196

LOESS
Geologic Nitrogen in Pleistocene Loe
Nebraska,
W77-00366

LONG ISLAND (NY)
Water Quality Aspects of Well Recharge
Reclaimed Water, Bay Park, New York,
W77-00492

LONG ISLAND SOUND
The Physical Oceanography and Water Q
of New York Harbor and Western Long
Sound,
W77-00273

LONG-RANGE FORECASTING (ICE)
Evaluation of Techniques for Long-
Forecasting of Air Temperature and Ice F
tion,
W77-00275

LONG-RANGE FORECASTS (ICE)
Long-Range Forecasting of Maximum I
tent on the Great Lakes,
W77-00276

LONG-TERM PLANNING
The Relevance of Technological Change in Long Term Water Resource Planning,
W77-00113 6B

LOUISIANA
Surface Runoff Losses of Fertilizer Elements,
W77-00165 5B

Ground-Water Levels in the United States, 1970-74: South-Central States.
W77-00430 4B

Centrifuge Plus Lime Limits Lignin in Waste Water,
W77-00464 5D

LUMBERING
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

LUMINESCENCE
Chemiluminescence Method of Determining Copper in Natural Waters, (In Russian),
W77-00404 5A

MAAR LAKES (AUSTRALIA)
A Comparative Study of the Limnology of Three Maar Lakes in Western Victoria (Australia), 1. Physiography and Physicochemical Featues,
W77-00447 2H

MACKEREL EGGS
Chromosome Mutagenesis in Developing Mackerel Eggs Sampled from the New York Bight,
W77-00274 5C

MAINE
Flood Hazard Analysis: Crooked River, Town of Casco, Town of Naples, Cumberland County, Maine,
W77-00100 4A

Fisheries Management and Social Context: The Case of the Maine Lobster Fishery,
W77-00383 6B

MALATHION
Substitute Chemical Program: Initial Scientific and Minieconomic Review of Malathion.
W77-00192 5C

MAMMALS
Significance of Water Vegetation in Desman Lands of the European Section of the USSR, (In Russian),
W77-00411 2I

MANAGEMENT
Inter-Plan Communication and Motivation Study, Final Report, Florida Background Study,
W77-00098 6B

OR Data Base Interface--An Application to Pollution Control,
W77-00116 5G

Management of the Ocean's Living Resources: An Essay Review,
W77-00179 6E

MANGANESE
Manganese and Iron Removal from Water by Adsorption on Diatomaceous Earth,
W77-00155 5F

Manganese in Fresh Waters, (In Russian),
W77-00405 5A

MANGANESE COMPLEXES
Manganese in Fresh Waters, (In Russian),
W77-00405 5A

MAPPING
Mapping Runoff-Producing Zones in Humid Regions,
W77-00368 4A

Geomorphological Mapping Applied to Soil Erosion Evaluation,
W77-00369 2J

MAPS
Hydrologic Unit Map--1974, State of Iowa
W77-00425 7C

Hydrologic Unit Map--1974, State of Wyoming.
W77-00429 7C

MARINE FISHERIES
Management of the Ocean's Living Resources: An Essay Review,
W77-00179 6E

Fisheries Management and Social Context: The Case of the Maine Lobster Fishery,
W77-00383 6B

Forecasts of Atlantic and Gulf Menhaden Catches Based on the Historical Relation of Catch and Fishing Effort,
W77-00388 6C

Status of the Gulf and Atlantic Manhaden Fisheries and Implications for Resource Management,
W77-00389 6C

MARINE FOG
Project Fog Drops V - Task I: A Numerical Model of Advection Fog, Task II: Recommendations for Simplified Individual Zero-Gravity Cloud Physics Experiments,
W77-00357 2B

MARINE MICROORGANISMS
Geographical and Seasonal Variability of Marine Plankton.
W77-00393 5C

Phylogeny of the Family Calanidae(Copepoda) on the Basis of a Comparative Morphological Analysis of its Characters,
W77-00394 5C

Zooplankton of Dikson Bay (Kara Sea),
W77-00395 5C

Structure of the Mandibles in the Genus Calanus S.L. in Relation to Latitudinal Zonality,
W77-00396 5C

Seasonal Changes of Antarctic Plankton in the Molodezhaya and Mirny Region,
W77-00397 5C

Biological Seasons in the Zooplankton of Davis Strait,
W77-00398 5C

Species Composition and Distribution of Ecological Complexes of Zooplankton in the Enisei Gulf,
W77-00399 5C

Geographical Variability of Some Species of the Family Oithonidae (Copepoda, Cyclopoida),
W77-00400 5C

Intraspecific Differentiation of Calanus Plumchrus Marukawa,
W77-00401 5C

MARINE MINING
Marine Sand and Gravel Mining,
W77-00195 3E

MARSH PLANTS
A Four-Year Analysis of Vegetation Following an Oil Spill in a Freshwater Marsh,
W77-00147 5C

MARYLAND
Coliform Bacteria from Diffuse Sources as a Factor in Estuarine Pollution,
W77-00359 5B

MASCOMA LAKE (NH)
Flexural Strength of Lake Ice in Relation to Its Growth Structure and Thermal History,
W77-00354 2C

MASSACHUSETTS
Fort River Ecosystem: Productivity of the Periphyton Component,
W77-00149 5C

MATERIALS
Maine Sewer Bid 39% Below Estimate.
W77-00071 5D

Large-Diameter Corrugated Steel Pipe Enters Storm Sewer Field.
W77-00074 5D

MATHEMATICAL MODELS
Closed Loop Hierarchical Control for River Pollution,
W77-00051 5G

Equalization of Time Variable Waste Loads,
W77-00052 5D

Flow Approaching Filter Washwater Troughs,
W77-00053 5D

Stochastic Considerations in Thunderstorm Modeling,
W77-00087 2B

A Phosphorus Residence Time Model: Theory and Application,
W77-00124 5B

Numerical Simulation of the Arctic Ocean Circulation,
W77-00129 2L

Numerical Estuarine Models for Water Quality Management in the Blackstone River-Providence River and the Taunton River-Mt. Hope Bay Complexes,
W77-00152 5B

Modeling of Soil Movement Across a Watershed,
W77-00159 2J

Two-Dimensional Solutes Transfer During Nonsteady Infiltration: Laboratory Test of Mathematical Model,
W77-00288 2G

Modeling of the Transformation of Nitrogen Compounds in a Closed Aquatic Chemical-Ecological Microsystem, (In Russian),
W77-00494 5B

MEASUREMENT
Float Calibration in Integrated-Float Techniques,
W77-00088 7B

MEDITERRANEAN OUTFLOW REGION
Salt Fingers Observed in the Mediterranean Outflow Region (34 N, 11 W) Using a Towed Sensor,
W77-00363 2L

MEJILLONES BAY (CHILE)
Diet of Hippoglossina Macrops (Steindachner) in Mejillones (Pisces, Bothidae), (IN Spanish),
W77-00502 2L

MEMBRANE FILTERS
Towards Method Standardization: E. Coli Counts in Water Samples Using Membrane Filters, (In Turkish),
W77-00453 5A

MERCURY
Behavior of Mercury in Suspended Solids and Bottom Sediments,
W77-00007 5C

Deposition of Airborne Mercury from Six Swedish Chlor-Alkali Plants Surveyed by Moss Analysis,
W77-00186 5A

Interaction Between Aquatic Plants and Bed Sediments in Mercury Uptake from Flowing Water,
W77-00301 5C

MERCURY COMPOUNDS
Behavior of Mercury in Suspended Solids and Bottom Sediments,
W77-00007 5C

METABOLISM
The Growth-Promoting Activity of Some Algal Metabolites on Scenedesmus Acutus,
W77-00190 5C

METAPENAEUS-MONOCEROS
Fishery and Biology of Metapenaeus Monoceros (Fabricius) from the Godavari Estuarine System,
W77-00424 2L

METHANE
Utilization of Methane from Sludge Digestion,
W77-00036 5D

METHODOLOGY
Social Impact Assessment: An Overview,
W77-00103 6B

The Use of Stochastic Models in the Interpretation of HIstorical Data From Sewage Treatment Plants,
W77-00121 5D

A Method for Selecting and Evaluating Simulation Games as Educational Tools for Water Resources Planning,
W77-00148 6A

Identification of Oil Pollutants: A Review of Some Recent Methods,
W77-00221 5A

Development of Methodology and Apparatus for the Bioassay of Oil,
W77-00266 5A

A Systematic Procedure for Taxing Agricultural Pollution Sources,
W77-00314 5G

Decision-Making in Recreational Fisheries Management: an Analysis,

RICE
The Change of Clay Material in Chernozems Under Rice Cultivation, (In Russian),
W77-00523 2G

RIVER BASINS
A Reliability Assessment for Regional Water Quality Management,
W77-00114 5G

Link Slope Distribution in Channel Networks,
W77-00370 2A

Mean Annual Runoff in the Upper Ohio River Basin, 1941-70, and its Historic Variation,
W77-00428 2E

Hydrogeochemistry of the Genoa River Basin, New South Wales - Victoria (Australia),
W77-00452 2K

RIVER FLOW
The Influence of Hydrological Conditions on Dissolved and Suspended Constituents in the Missouri River,
W77-00184 5C

RIVER FORECASTING
Flood Plain Information: Southampton County, Virginia.
W77-00104 4A

Catchment Modeling and Initial Parameter Estimation for the National Weather Service River Forecast System,
W77-00272 2A

RIVER SYSTEMS
An Overview of the Impact Study of the McClellan-Kerr Multiple Purpose Arkansas River System,
W77-00101 6G

RIVERS
Closed Loop Hierarchical Control for River Pollution,
W77-00051 5G

Study of the Ural River Benthos, (In Russian),
W77-00091 2I

State of Wisconsin Automatic Water Quality Monitoring System for the Fox and Wisconsin Rivers,
W77-00334 5A

Hydrogeochemical Investigation of the Danube Water in Austria During the Years 1971 and 1972, (In German),
W77-00406 5A

The Importance of Bacteriological Investigations for the Classification of flowing Water Bodies, Demonstrated on the Austrian Part of the Danube, (In German),
W77-00407 5A

Events in the Djerdap Reservoir Immediately After Impoundment, (In German),
W77-00409 2H

Significance of Water Vegetation in Desman Lands of the European Section of the USSR, (In Russian),
W77-00411 2I

Evolutionary Aspect of the Reproductive Evology of Salmon of the Genus Salmo in Some Water Bodies of Kamchatka, (In Russian),
W77-00519 2I

ROAD CONSTRUCTION
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

RODENTS
Significance of Water Vegetation in Desman Lands of the European Section of the USSR, (In Russian),
W77-00411 2I

RUDYAK SOILS
Origin and Use of Rudyak Soils, Ferruginous Solonchaks of the Taiga Zone, (In Russian),
W77-00511 2G

RUNOFF
The Influence of Hydrological Conditions on Dissolved and Suspended Constituents in the Missouri River,
W77-00184 5C

Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

Mapping Runoff-Producing Zones in Humid Regions,
W77-00368 4A

Factors Affecting Spring Runoff on Two Forested Watersheds,
W77-00374 2E

RUNOFF-PRODUCING ZONES
Mapping Runoff-Producing Zones in Humid Regions,
W77-00368 4A

RYBINSK RESERVOIR (USSR)
Volatile Fatty Acids in Bottom Deposits of the Rybinsk Reservoir, (In Russian),
W77-00126 5C

RYEGRASS
Sodium Availability in Nonalkali Soils,
W77-00296 2G

SAFETY FACTORS
Spill Prevention in Offshore Petroleum Producing Facilities,
W77-00202 5G

SALICYLANILIDE
Evaluation of the Toxicity of Substances Being Released into Water Bodies for the Early Development of Fish, (In Russian),
W77-00189 5C

SALINE LAKES
Isolation and Identification of Blue-Green Algae Producing Muddy Odor Metabolites, Geosmin, and 2-Methylisoborneol, in Saline Lakes in Manotoba,
W77-00185 5A

A Comparative Study of the Limnology of Three Maar Lakes in Western Victoria (Australia), 1. Physiography and Physicochemical Featues,
W77-00447 2H

SALINE WATER-FRESHWATER INTERFACES
Surface Nutrients, Chlorophyll-A and Phaeopigment in Some Scottish Sea Lochs,
W77-00182 5C

SALINE WATER INTRUSION
Measurements of Estuary Dispersion Coefficients,
W77-00381 5B

SALINITY
Temperature-Salinity Curves in the Pacific and Their Application to Dynamic Height Computation,
W77-00138 2L

A Systematic Procedure for Taxing Agricultural Pollution Sources,
W77-00314 5G

Variability of Amino Acid Composition of Algae Inhabiting the Zone of Variable Salinity (In Russian),
W77-00345 5A

Salt Fingers Observed in the Mediterranean Outflow Region (34 N, 11 W) Using a Towed Sensor,
W77-00363 2I

A Comparative Study of the Limnology of Three Maar Lakes in Western Victoria (Australia), 1. Physiography and Physicochemical Featues,
W77-00447 2H

SALMON
Evolutionary Aspect of the Reproductive Evology of Salmon of the Genus Salmo in Some Water Bodies of Kamchatka, (In Russian),
W77-00519 2I

SALMON CREEK (AK)
Flood Plain Information: Resurrection River and Salmon Creek, Alaska.
W77-00105 4A

SALMONELLA
Klebsiella Densities in Waters Receiving Wood Pulp Effluents,
W77-00337 5C

The Effect of Surface-Active Substances on Pathogenic Enterobacteria in Water, (In Russian),
W77-00346 5C

SALMONELLA-TYPHIMURIUM
The Effect of Surface-Active Substances on Pathogenic Enterobacteria in Water, (In Russian),
W77-00346 5C

SALMONIDS
A Rapid Method for Measuring the Acute Toxicity of Pulp Mill Effluents and Other Toxicants to Salmonid Fish at Ambient Room Temperature,
W77-00336 5C

SALT FINGER CONVECTION
Salt Fingers Observed in the Mediterranean Outflow Region (34 N, 11 W) Using a Towed Sensor,
W77-00363 2I

SALT FINGERS
Salt Fingers Observed in the Mediterranean Outflow Region (34 N, 11 W) Using a Towed Sensor,
W77-00363 2I

SALT MARSHES
Capacity of a Spartina Salt Marsh to Assimilate Nitrogen from Secondarily Treated Sewage,
W77-00003 5B

SAMPLING
Remote Sampler for Determining Residual Oil Content of Surface Waters,
W77-00216 5A

A Procedure for the Sampling and Testing of Large Soil Cores,
W77-00286 2G

utomatic Determination of Waste Water haracteristics (Automatische Bestimmung von bwasserkenngroessen),
/77-00338 5A

lydrogeochemical Investigation of the Danube Vater in Austria During the Years 1971 and 972, (In German),
/77-00406 5A

hanges in the Chironomid Fauna Caused by amming the Danube, (In German),
/77-00414 5C

ooplankton of the Akstafa Reservoir, (In Rus-ian),
/77-00416 2H

uitability of Containers for Storage of Water amples,
/77-00436 5A

owards Method Standardization: E. Coli ounts in Water Samples Using Membrane Fil-ers, (In Turkish),
/77-00453 5A

he Mineral Content in Soil and Subsoil Water lose to the Surface Below Coniferous and rable Land in Sandy Soil of Northwest Ger-any, (In German),
/77-00493 2G

easonal Activity and Environmental Control f Foraging of the Subterranean Termite, eterotermes Aureus (Snyder), in a Desert rassland,
/77-00515 2I

N ANTONIO AREA (TEX)
round-Water Discharge from the Edwards nd Associated Limestones, San Antonio Area, exas, 1975,
/77-00479 4B

N ANTONIO RIVER BASIN (TEX)
A Reliability Assessment for Regional Water uality Management,
/77-00114 5G

N DIEGO BAY (CALIF)
eabed Drifter Movement in San Diego Bay nd Adjacent Waters,
/77-00356 5B

N DIEGO (CALIF)
an Diego: Civil Engineering Innovations bound.
/77-00063 5D

NDS
arine Sand and Gravel Mining,
/77-00195 3E

he Effect of Soil Properties on Zinc Adsorp-ion by Soils,
/77-00469 2G

NTA BARBARA (CA)
A Reinvestigation of Southern California ocky Intertidal Beaches Three and One-Half ears after the 1969 Santa Barbara Oil Spill: A reliminary Report,
/77-00267 5C

NTA RITA CREEK BASIN (CALIF)
ediment Discharge in the Upper Arroyo rande and Santa Rita Creek Basins, San Luis bispo County, California,
/77-00487 2J

SATURATED SOILS
Formation of Chemical and Biological Denitrification Products in Flooded Soil at Controlled pH and Redox Potential,
W77-00308 2G

Variations in Picloram Leaching Patterns for Several Soils,
W77-00476 2G

SCALE EFFECT
Similitude in Coastal Engineering,
W77-00380 8B

SCALING
Wastewater Treatment by Reverse Osmosis,
W77-00081 5D

SCENDESMUS
The Elimination of Phosphates and Nitrates from Waste Water by Algal Cultures: II. Tertiary Treatment Potential of Algae, (In Dutch),
W77-00110 5D

The Growth-Promoting Activity of Some Algal Metabolites on Scenedesmus Acutus,
W77-00190 5C

SEA SURFACE TEMPERATURE
Sea Surface Temperature Fluctuations at Tidal Frequencies at Weather Ships Charlie and Delta,
W77-00137 2L

SEA TRUTH DATA
The Use of ERTS-1 to More Fully Utilize and Apply Marine Station Data to the Study and Productivity Along the Eastern Shelf Waters of the United States,
W77-00198 5A

SEA WATER
Re-Assessment of Chelating Ion-Exchange Resins for Trace Metal Analysis of Sea Water,
W77-00320 5A

The Determination of Zinc, Cadmium, Lead and Copper in a Single Sea-Water Sample by Differential Pulse Anodic Stripping Voltammetry,
W77-00321 5A

Role of the Mussel in Purifying Sea Water of Petroleum Products (In Experiment), (In Russian),
W77-00418 5G

SEASONAL
Biological Seasons in the Zooplankton of Davis Strait,
W77-00398 5C

SEDIMENT CONTROL
Guidelines for Sediment Control in Irrigation Return Flow,
W77-00090 5G

Iowa's Experience with a Mandatory Sediment Control Law,
W77-00477 6E

SEDIMENT CONTROL LAWS
Iowa's Experience with a Mandatory Sediment Control Law,
W77-00477 6E

SEDIMENT DISCHARGE
Sediment Discharge in the Upper Arroyo Grande and Santa Rita Creek Basins, San Luis Obispo County, California,
W77-00487 2J

SEDIMENT TRANSPORT
Modeling of Soil Movement Across a Watershed,
W77-00159 2J

Adjustment of Stream-Channel Shape to Hydrologic Regime,
W77-00379 8B

Similitude in Coastal Engineering,
W77-00380 8B

Sediment Discharge in the Upper Arroyo Grande and Santa Rita Creek Basins, San Luis Obispo County, California,
W77-00487 2J

An Overview of Urban Sedimentology,
W77-00491 4C

SEDIMENT YIELD
Sediment Discharge in the Upper Arroyo Grande and Santa Rita Creek Basins, San Luis Obispo County, California,
W77-00487 2J

SEDIMENTATION
Physical-Chemical Treatment Improves Iran's Urban Runoff,
W77-00077 5D

Assessment of Practicality of Remote Sensing Techniques for A Study of the Effects of Strip Mining in Alabama,
W77-00170 5C

SEDIMENTOLOGY
Appendix 4, Limnology of Lakes and Embayments, Great Lakes Basin Framework Study.
W77-00358 2H

SEDIMENTS
Associations of Chlorinated Hydrocarbons with Fine Particles and Humic Substances in Nearshore Surficial Sediments,
W77-00086 5A

The Use of ERTS-1 to More Fully Utilize and Apply Marine Station Data to the Study and Productivity Along the Eastern Shelf Waters of the United States,
W77-00198 5A

Economic Impacts of State Environmental Programs in a National Framework: The Iowa Conservancy Law,
W77-00303 6G

Iowa's Experience with a Mandatory Sediment Control Law,
W77-00477 6E

Qualitative Composition of the Suspended Sediments of the Ordzhonikidze Irrigation System, (In Russian),
W77-00497 2J

SEICHES
Trieste–Water Levels 1952-1971; A Study of the Tide, Mean Level, and Seiche Activity,
W77-00128 2L

SELF PURIFICATION
Functional Design of Sanitary Sewers,
W77-00068 5D

Hygienic Aspects of Microbial Contamination of Water Basins, (In Russian),
W77-00454 5B

SEMICHEMICAL PULP MILLS
Waste Water Treatment at SCP (Semichemical Pulp), CGP (Chemigroundwood Pulp) Mills,
W77-00329 5D

SEPARATION TECHNIQUES
Polymers Play Increased Role in Water Clarification,
W77-00082 5D

Analytical Examination of Oil/Water Separation by Coalescence,
W77-00241 5G

Evaluation of a Unique Centrifuge for Separation of Oil from Ship Discharge Water,
W77-00242 5G

Drop Size Distributions in Oil Water Mixtures,
W77-00247 5G

Jet Oil Recovery Device,
W77-00261 5G

SEWAGE
High Energy Radiation in Sludge Treatment - Status and Prospects,
W77-00022 5D

Some Thoughts on Zero Discharge,
W77-00125 5G

SEWAGE EFFLUENTS
The Physical Oceanography and Water Quality of New York Harbor and Western Long Island Sound,
W77-00273 5G

SEWAGE SLUDGE
Capacity of a Spartina Salt Marsh to Assimilate Nitrogen from Secondarily Treated Sewage,
W77-00003 5B

The Past, Present, and Future Prospects of Burning Municipal Sewage Sludge Along with Mixed Municipal Refuse,
W77-00021 5E

Pyrolysis of Sewage Sludge,
W77-00024 5E

Effects of Sewage Sludge or Effluent Application to Soil on the Movement of Nitrogen, Phosphorus, Soluble Salts and Trace Elements to Groundwaters,
W77-00029 5C

Composting Raw Sludge,
W77-00038 5D

Wastewater Sludge as a Fertilizer Substitute,
W77-00046 5E

Evaluation of Proposed Man-Made Ponds for Food Production to Recover Values in Waste Heat and Solid Organic Sludges,
W77-00150 5D

SEWAGE TREATMENT
Potential Health Impacts of Sludge Disposal on the Land,
W77-00033 5C

Cross-Flow Filtration in Physical-Chemical Treatment of Municipal Sewage Effluents,
W77-00042 5D

Removal vs Benefits: It Can Be Too Costly,
W77-00044 5D

Activated Carbon Odor Control System,
W77-00056 5D

New Acton Grange Works.
W77-00061 5D

San Diego: Civil Engineering Innovations Abound.
W77-00063 5D

Powdered Activated Carbon Improves Anaerobic Digestion,
W77-00067 5D

The Use of Stochastic Models in the Interpretation of HIstorical Data From Sewage Treatment Plants,
W77-00121 5D

Sanitary-Bacteriological Evaluation of the Method of Treatment at a Small Sewage Plant, (In Russian),
W77-00350 5D

New Method of Sewage Sludge Decontamination, (In Russian),
W77-00352 5D

Basf Completes Ten-Year Project for Cleaning up the Rhine,
W77-00403 5D

SEWERAGE
Potential Health Impacts of Sludge Disposal on the Land,
W77-00033 5C

Sewering The City of New York,
W77-00070 5D

SEWERS
Functional Design of Sanitary Sewers,
W77-00068 5D

Sewering The City of New York,
W77-00070 5D

Planning and Construction of Birmingham's Main Outfall Sewer,
W77-00072 5D

A Retrospective on the Structural Stability of RCC Spun Sewer Pipes,
W77-00073 5D

Large-Diameter Corrugated Steel Pipe Enters Storm Sewer Field.
W77-00074 5D

Sewer Force Main Helps Solve Pollution Problem.
W77-00075 5D

Kaministiquia Interceptor Sewer Completed in Thunder Bay.
W77-00076 5D

SHALLOW LAKES
A Simple Method for Determining the Evaporation from Shallow Lakes and Ponds,
W77-00127 2D

SHEAR
A Study of Some Effects of Vertical Shear on Thunderstorms,
W77-00168 2B

SHEEFISH
Feeding of Sheefish in the Upper Ob Above the Dam of the Novosibirsk Hydroelectric Station, (In Russian),
W77-00522 2I

SHELLFISH
Determination of N-Alkane and Methylnaphthalene Compounds in Shellfish,
W77-00220 5A

SHELLFISH FARMING
Blue Gold: Mariculture of the Edible Blue Mussel (Mytilus Edulis),
W77-00386 6C

On the Oceanographic Conditions of Oys Farming Area Near Chungmu, (In Korean),
W77-00498

SHORE PROTECTION
Tri-State Conference Report: Methods Beach and Sand Dune Protection,
W77-00193

SHOSTKA RIVER
Effectiveness of Wastewater Treatment at Shostka 50th Anniversary of the USSR Che cal Plant, (In Russian),
W77-00351

SHRIMP
Fishery and Biology of Metapena Monoceros (Fabricius) from the Goda Estuarine System,
W77-00424

SIBERIA
Hygienic Problems of Environmental Prot tion in Connection with the Further Devel ment of Siberia and the Far East, (In Russia
W77-00349

SIEROZEMS
Qualitative Composition of the Suspen Sediments of the Ordzhonikidze Irrigat System, (In Russian),
W77-00497

SIERRA NEVADA
Measurements of Liquid Water Content Winter Cloud Systems Over the Sierra Neva
W77-00164

SIMILITUDE
Similitude in Coastal Engineering,
W77-00380

SIMULATION ANALYSIS
A Reliability Assessment for Regional Wa Quality Management,
W77-00114

A Computerized System for Wild Land U Planning and Environmental Impact Asse ment,
W77-00119

A Method for Selecting and Evaluating Simu tion Games as Educational Tools for Wa Resources Planning,
W77-00148

Balancing Environmental Quality, Energy U and Growth: Difficult Decisions,
W77-00175

Digital Simulation of a Basalt Aquifer Syste Walla Walla River Basin, Washington a Oregon,
W77-00481

Lakes Marion-Moultrie Stream System vestigation: Part II-Simulation Studies,
W77-00488

One-Dimensional Simulation of Aquifer Syst Compaction near Pixley, California: 2. Stre Dependent Parameters,
W77-00490

SITES
Evaluation of Recreational Sites,
W77-00387

SKIMMING
Developing a Total Oil Spill Cleanup Capabil in the San Francisco Bay Area,
W77-00200

Free Vortex Recovery of Floating Oil,
W77-00235 5G

Use of the Massachusetts Dip Oil Skimmer on Free Slicks in the Casco Bay (Portland) Spill,
W77-00265 5G

LOPES
Link Slope Distribution in Channel Networks,
W77-00370 2A

LUDGE
Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal.
W77-00009 5D

FDA's Overview of the Potential Health Hazards Associated with the Land Application of Municipal Wastewater Sludges,
W77-00034 5E

Activated Carbon Odor Control System,
W77-00056 5D

LUDGE DIGESTION
A Summary of Observations on Thermophilic Digester Operations,
W77-00035 5D

Utilization of Methane from Sludge Digestion,
W77-00036 5D

LUDGE DISPOSAL
Environmental Impact of Cadmium and Other Heavy Metals from Land-Applied Sewage Sludge,
W77-00002 5C

Proceedings of the 1975 National Conference on Municipal Sludge Management and Disposal.
W77-00009 5D

Regional Wastewater Solids Management Program Los Angeles-Orange County Metropolitan Area,
W77-00011 5E

Computer Evaluation of Sludge Handling and Disposal Costs,

kes Marion-Moultrie Stream System In-stigation: Part II-Simulation Studies,
77-00488 4A

TH-CENTRAL STATES
round-Water Levels in the United States, 70-74: South-Central States.
77-00430 4B

TH DAKOTA
lot Investigation of the Importance of Vari-s Wetland Types to Duck Production,
77-00145 2H

e Response of Macroinvertebrates to soline Pollution in a Mountain Stream,
77-00268 5C

TH YAMHILL RIVER (OR)
tchment Modeling and Initial Parameter Esti-ation for the National Weather Service River recast System,
77-00272 2A

SOUTHEAST U.S.
Floods of March-April 1973 in Southeastern United States,
W77-00434 2E

SOUTHEAST US
Tri-State Conference Report: Methods for Beach and Sand Dune Protection,
W77-00193 4D

United States Coast Pilot 4 - Atlantic Coast from Cape Henry to Key West.
W77-00278 4A

SOUTHEAST US COAST
United States Coast Pilot 4 - Atlantic Coast from Cape Henry to Key West.
W77-00278 4A

SPARTINA ALTERNIFLORA
Capacity of a Spartina Salt Marsh to Assimilate Nitrogen from Secondarily Treated Sewage,
W77-00003 5B

SPATIAL DISTRIBUTION
Spatial Variability in Soils Below Depth of Tillage: Bulk Density and Fifteen Atmosphere Percentage,
W77-00284 2G

SPAWING
Evolutionary Aspect of the Reproductive Evology of Salmon of the Genus Salmo in Some Water Bodies of Kamchatka, (In Russian),
W77-00519 2I

SPAWNING
Presence of Spring and Winter Races of the Nelma in the OB River, (In Russian),
W77-00057 2I

SPECIATION
Intraspecific Differentiation of Calanus Plumchrus Marukawa,
W77-00401 5C

SPECIES DIVERSITY
Species Diversity of Freshwater Plankton Agglomerations, (In Polish),
W77-00495 7B

SPECTROPHOTOMETRY
Identification of Oil Pollutants: A Review of Some Recent Methods,
W77-00221 5A

The Spectrophotometric Determination of Arsenic in Sea Water, Potable Water, and Effluents,
W77-00319 5A

SPECTROSCOPY
Remote Detection of Water Pollutants by Computerized Laser-Raman Spectroscopy,
W77-00154 5A

SPRINGS
Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1975,
W77-00479 4B

ST. LAWRENCE RIVER
Surface Water Supply of the United States, 1966-70: Part 4. St. Lawrence River Basin--Volume 2. St. Lawrence River Basin Below Lake Huron.
W77-00431 4A

ST. LAWRENCE RIVER BASIN
Surface Water Supply of the United States, 1966-70: Part 4. St. Lawrence River Basin--Volume 2. St. Lawrence River Basin Below Lake Huron.
W77-00431 4A

STABILIZATION
Decrease of Bacterial Content in Different Types of Stabilization Ponds,
W77-00080 5D

STANDARD PROJECT FLOOD
Flood Plain Information: Southampton County, Virginia.
W77-00104 4A

STANDARDS
Development of a Standard Rating for the Price Pygmy Current Meter,
W77-00432 7B

STATISTICAL METHODS
Hydrologic Engineering Methods for Water Resources Development, Volume 3, Hydrologic Frequency Analysis,
W77-00169 4A

STATISTICAL MODELS
Pore Volume Distribution and Curve of Water Content Versus Suction of Porous Body: 2. The Boundary Wetting Curve,
W77-00162 2G

STEEL PIPES
Large-Diameter Corrugated Steel Pipe Enters Storm Sewer Field.
W77-00074 5D

STENDOUS-LEUCICHTHYS-NELMA
Presence of Spring and Winter Races of the Nelma in the OB River, (In Russian),
W77-00057 2I

STOCHASTIC PROCESSES
Economic Optimum Record Length,
W77-00117 4A

STOCHASTIC QUADRATIC PROGRAMMING
A Reliability Assessment for Regional Water Quality Management,
W77-00114 5G

STOLONS
On the Influence of Water Currents on the Growth of Hydrorhizal Colonies, (In German),
W77-00506 2I

STORAGE CONTAINERS
Suitability of Containers for Storage of Water Samples,
W77-00436 5A

STORM DRAINS
Large-Diameter Corrugated Steel Pipe Enters Storm Sewer Field.
W77-00074 5D

STORM RUNOFF
Application of a Hydrologic Model to the Planning and Design of Storm Drainage Systems for Urban Areas,
W77-00004 4A

An Overview of Urban Sedimentology,
W77-00491 4C

STORM WATER
Urban Stormwater Detention and Flow Attenuation,
W77-00078 5D

STORMS
Tropical Storm Agnes Pennsylvania's Torrey Canyon,
W77-00256 5G

STREAM CHANNELIZATION
Environmental Impact of Stream Channelization,
W77-00375 6G

STREAMFLOW
Catchment Modeling and Initial Parameter Estimation for the National Weather Service River Forecast System,
W77-00272 2A

Mean Annual Runoff in the Upper Ohio River Basin, 1941-70, and its Historic Variation,
W77-00428 2E

Surface Water Supply of the United States, 1966-70: Part 4. St. Lawrence River Basin--Volume 2. St. Lawrence River Basin Below Lake Huron.
W77-00431 4A

Floods of March-April 1973 in Southeastern United States,
W77-00434 2E

STREAMFLOW FORECASTING
Magnitude and Frequency of Floods in North Carolina: Technique for Estimating the Magnitude and Frequency of Floods on Natural Streams in North Carolina,
W77-00480 2E

Lakes Marion-Moultrie Stream System Investigation: Part II-Simulation Studies,
W77-00488 4A

STREAMS
Morphology of Cobble Streams in Small Watersheds,
W77-00089 2E

The Response of Macroinvertebrates to Gasoline Pollution in a Mountain Stream,
W77-00268 5C

Maximum Known Stages and Discharges of New York Streams Through 1973,
W77-00485 7C

STRENGTH
Flexural Strength of Lake Ice in Relation to Its Growth Structure and Thermal History,
W77-00354 2C

STRIP MINES
Assessment of Practicality of Remote Sensing Techniques for A Study of the Effects of Strip Mining in Alabama,
W77-00170 5C

STRUCTURAL STABILITY
A Retrospective on the Structural Stability of RCC Spun Sewer Pipes,
W77-00073 5D

STRUCTURE
Evaluation of Multi-Purpose Offshore Industrial-Port Islands. Vol II: Major Research Problems and Promising Research Approaches,
W77-00199 8C

STURGEON
Study of the Ural River Benthos, (In Russian),
W77-00091 2I

SUBARCTIC
The Generation of Runoff from Subarctic Snowpacks,
W77-00372 2C

Energy Balance Computations of Snowmelt in a Subarctic Area,
W77-00373 2C

SUBARCTIC SNOWPACKS
The Generation of Runoff from Subarctic Snowpacks,
W77-00372 2C

SUBMERGENCE
The Change of Clay Material in Chernozems Under Rice Cultivation, (In Russian),
W77-00523 2G

SUBSURFACE RUNOFF
Nitrogen in Subsurface Discharge from Agricultural Watersheds,
W77-00166 5B

SUBSURFACE WATERS
The Mineral Content in Soil and Subsoil Water Close to the Surface Below Coniferous and Arable Land in Sandy Soil of Northwest Germany, (In German),
W77-00493 2G

SUCCESSION
The Benthic Ecology of Loch Linnhe and Loch Eil, A Sea-Loch System on the West Coast of Scotland. IV. Changes in the Benthic Fauna Attributable to Organic Enrichment,
W77-00196 5C

SUGAR BEETS
Transport of Carbon14-Assimilates in the Sugar Beet Under Different Conditions of Nutrition and Moisture, (In Russian),
W77-00421 5B

SULFITE LIQUORS
Secondary Degradation of Sulfite Mill Waste Water by Development of Algal Masses (Sekundaerabbau von Sulfitzellstoffabwasser durch Algen-Massenentwicklungen),
W77-00341 5D

Spent Semichemical Pulping Liquors. (V). Improvement of Color-Removal Efficiency by Photochemical Treatment (In Japanese),
W77-00465 5D

SULFUR
Sorption of Sulfur Dioxide by Calcareous Soils,
W77-00295 5B

SULFUR COMPOUNDS
Sorption of Sulfur Dioxide by Calcareous Soils,
W77-00295 5B

SULFUR DIOXIDE
Sorption of Sulfur Dioxide by Calcareous Soils,
W77-00295 5B

SULPHUR
Soil Organic Matter Fractions as Sources of Plant Available Sulphur,
W77-00310 2G

SURFACE-ACTIVE SUBSTANCES
The Effect of Surface-Active Substances on Pathogenic Enterobacteria in Water, (In Russian),
W77-00346 5C

SURFACE-GROUNDWATER RELATIONSHIPS
Mechanism of Interaction of Weakly Mineralized Irrigation Water with Soil, (In Russian),
W77-00524 2G

SURFACE MINING
Erosion and Runoff on Forest and Range Lands,
W77-00332 4C

SURFACE MIXED LAYER
Climatological Numerical Models of the Surface Mixed Layer of the Ocean,
W77-00361 2L

SURFACE RUNOFF
Estimation and Simulation of Sheet Runoff,
W77-00439 4A

SURFACE WATERS
Remote Sampler for Determining Residual O Content of Surface Waters,
W77-00216 5A

Surface Water Supply of the United States 1966-70: Part 4. St. Lawrence River Basin. Volume 2. St. Lawrence River Basin Below Lake Huron.
W77-00431 4A

Water Resources Data for Alabama, Water Year 1975.
W77-00435 7C

Stoichiometric Distance and Total Concentration: A Binary Numerical Description of Inland Water Cehmistry,
W77-00449 2K

SURFACTANTS
Experimental Ecosystems to Measure Fate of Oil Spills Dispersed by Surface Active Products,
W77-00251 5B

SUSPENDED SOLIDS
Behavior of Mercury in Suspended Solids and Bottom Sediments,
W77-00007 5B

The Influence of Hydrological Conditions on Dissolved and Suspended Constituents in the Missouri River,
W77-00184 5B

The Use of ERTS-1 to More Fully Utilize and Apply Marine Station Data to the Study and Productivity Along the Eastern Shelf Waters of the United States,
W77-00198 5C

Diminution of Suspended Solids in Pulp and Paper Industry Effluents by Treatment with Chemical Coagulants (Diminuarea continutului de suspensii totale in apele reziduale din industria celulozei si hirtiei, prin tratarea cu agenti chimici coagulanti),
W77-00323 5D

Qualitative Composition of the Suspended Sediments of the Ordzhonikidze Irrigation System, (In Russian),
W77-00497 2J

SWEDEN
Deposition of Airborne Mercury from Swedish Chlor-Alkali Plants Surveyed by Model Analysis,
W77-00186 5B

Two Types of Oil Spills in Swedish Inland Waters--Tests of New Materials, Ideas and Methods,
W77-00255 5G

MBIOSIS
Vastes Find Fertile Field as Low-Cost Plant Nutrients,
W77-00050 5E

Water-Reuse Systems Star at Cincinnati Aiche Meeting,
W77-00054 5D

STEMATICS
Microorganisms as Indicators of the Environmental Hygiene: Ecology, Taxonomy and Enumeration, (In Dutch),
W77-00348 5A

hylogeny of the Family Calanidae(Copepoda) n the Basis of a Comparative Morphological nalysis of its Characters,
W77-00394 5C

STEMS ANALYSIS
onceptual Framework of Environmental Ianagement,
W77-00178 6G

he Environment and the Structure of Social oals,
W77-00181 5G

GA
rigin and Use of Rudyak Soils, Ferruginous olonchaks of the Taiga Zone, (In Russian),
W77-00511 2G

SMANIA
toichiometric Distance and Total Concentration: A Binary Numerical Description of Inland Water Cehmistry,
W77-00449 2K

KES
Regional Market for Rights to User Fertilizer s a Means of Achieving Water Quality Standards,
W77-00173 5G

Systematic Procedure for Taxing Agricultural Pollution Sources,
W77-00314 5G

CHNOLOGICAL CHANGE
he Relevance of Technological Change in ong Term Water Resource Planning,
W77-00113 6B

CHNOLOGY TRANSFER
ffectiveness of Information Transfer Through ater Resources Researcher/User Group Interaction,
W77-00151 10D

MPERATURE
emperature-Salinity Curves in the Pacific and heir Application to Dynamic Height Computation,
W77-00138 2L

lt Fingers Observed in the Mediterranean utflow Region (34 N, 11 W) Using a Towed nsor,
W77-00363 2L

ological and Physiological Patterns of lyartemia Forcipata (Anostraca) from Tuna Water Bodies of the East Murman, (In Russn),
W77-00525 2I

MPERATURE-SALINITY CURVES
mperature-Salinity Curves in the Pacific and eir Application to Dynamic Height Computan,
W77-00138 2L

TEMPERATURE-SALINITY DYNAMIC HEIGHT
Temperature-Salinity Curves in the Pacific and Their Application to Dynamic Height Computation,
W77-00138 2L

TEMPORAL DISTRIBUTION
Zooplankton of Dikson Bay (Kara Sea),
W77-00395 5C

Seasonal Changes of Antarctic Plankton in the Molodezhaya and Mirny Region,
W77-00397 5C

Species Composition and Distribution of Ecological Complexes of Zooplankton in the Enisei Gulf,
W77-00399 5C

TERMITES
Seasonal Activity and Environmental Control of Foraging of the Subterranean Termite, Heterotermes Aureus (Snyder), in a Desert Grassland,
W77-00515 2I

TERTIARY TREATMENT
The Effects of Various Tertiary Treatment Nutrient Removal Schemes on Periphyton Communities in Model Laboratory Streams,
W77-00005 5C

AWT Plant Begins Operations.
W77-00055 5D

The Elimination of Phosphates and Nitrates from Waste Water by Algal Cultures: II. Tertiary Treatment Potential of Algae, (In Dutch),
W77-00110 5D

The Elimination of Phosphates and Nitrates from Waste Water by Algal Cultures. III, (In Dutch),
W77-00111 5D

Tertiary Treatment and Reuse of Animal Wastes,
W77-00158 5D

TEXAS
A Reliability Assessment for Regional Water Quality Management,
W77-00114 5G

Ground-Water Levels in the United States, 1970-74: South-Central States.
W77-00430 4B

Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1975,
W77-00479 4B

TEXTILES
Sorption on Activated Carbon of Impurities of Textile Industry Effluents (Sorpcja zanieczyszczen ze sciekow przemyslu wlokienniczego na weglu aktywnym),
W77-00339 5D

Process for Purifying Industrial Waste Waters (Procede d'epuration d'eaux usees industrielles).
W77-00342 5D

THERMAL POLLUTION
Analytical Solution for 3-D Diffusion Model,
W77-00141 5B

Effect of the Discharge Waters of the Tripol'e Thermal Electric Station of the Thermal Regime of the Dnieper, (In Russian),
W77-00408 5C

THERMAL POWERPLANTS
Effect of the Discharge Waters of the Tripol'e Thermal Electric Station of the Thermal Regime of the Dnieper, (In Russian),
W77-00408 5C

THERMAL WASTE
Evaluation of Proposed Man-Made Ponds for Food Production to Recover Values in Waste Heat and Solid Organic Sludges,
W77-00150 5D

THERMOCLINE
Role of Eddy Diffusivity in Thermocline Formation,
W77-00139 2H

THERMODYNAMICS
Sludge Pyrolysis for Energy Recovery and Pollution Control,
W77-00025 5E

THERMOPHILIC BACTERIA
A Summary of Observations on Thermophilic Digester Operations,
W77-00035 5D

THERMOPHILIC DIGESTION
A Summary of Observations on Thermophilic Digester Operations,
W77-00035 5D

THUNDERSTORMS
A Study of Some Effects of Vertical Shear on Thunderstorms,
W77-00168 2B

TIDAL EFFECTS
Sea Surface Temperature Fluctuations at Tidal Frequencies at Weather Ships Charlie and Delta,
W77-00137 2L

Measurements of Estuary Dispersion Coefficients,
W77-00381 5B

TIDAL MARSHES
Proximate Nutritive Value Changes During Decomposition of Salt Marsh Plants,
W77-00402 5C

TIDE DRAINS
Performance and Evaluation of Combined Mole-Tile Drain System in Heavy Soils,
W77-00316 4A

TIDES
Trieste–Water Levels 1952-1971; A Study of the Tide, Mean Level, and Seiche Activity,
W77-00128 2L

Vertical Diffusion Driven by Internal Waves in a Sill Fjord,
W77-00360 2L

TILE DRAINS
Economics of Increased Mobility from Tile Drainage,
W77-00313 3F

TIME SERIES ANALYSIS
The Use of Stochastic Models in the Interpretation of HIstorical Data From Sewage Treatment Plants,
W77-00121 5D

TIMOTHY ROOTS
Dynamics of the Composition and the Qualities of Water-Soluble Organic Substance During the Composting of Clover and Timothy Roots, (In Russian),
W77-00062 5B

TOXICITY
Environmental Impact of Cadmium and Other Heavy Metals from Land-Applied Sewage Sludge,
W77-00002 5C

Plant Uptake of Heavy Metals from Sewage Sludge Applied to Land,
W77-00028 5D

Evaluation of the Toxicity of Substances Being Released into Water Bodies for the Early Development of Fish, (In Russian),
W77-00189 5C

Determination of N-Alkane and Methylnaphthalene Compounds in Shellfish,
W77-00220 5A

Charcteristics of Naturally Occurring and Pollutant Hydrocarbons in Marine Sediments,
W77-00223 5A

The Toxicity Testing of Oils and Dispersants: A European View,
W77-00229 5G

Experimental Ecosystems to Measure Fate of Oil Spills Dispersed by Surface Active Products,
W77-00251 5B

The Response of Macroinvertebrates to Gasoline Pollution in a Mountain Stream,
W77-00268 5C

A Rapid Method for Measuring the Acute Toxicity of Pulp Mill Effluents and Other Toxicants to Salmonid Fish at Ambient Room Temperature,
W77-00336 5C

Identification of Two Chlorinated Guaiacols in Kraft Bleaching Wastewaters,
W77-00459 5A

National Conference on Polychlorinated Biphenyls (November 19-21, 1975, Chicago, Illinois), Proceedings.
W77-00460 5B

Chlorinated Guaiacols in Bleachery Wastes: Comments on a Paper by Leach and Thakore,
W77-00467 5A

(Chlorinated Guaiacols in Bleachery Wastes–) Response to the Comments of I. H. Rogers,
W77-00468 5A

TRACE ELEMENTS
Re-Assessment of Chelating Ion-Exchange Resins for Trace Metal Analysis of Sea Water,
W77-00320 5A

The Determination of Zinc, Cadmium, Lead and Copper in a Single Sea-Water Sample by Differential Pulse Anodic Stripping Voltammetry,
W77-00321 5A

TRANS-ALASKA PIPELINE (ALAS)
Channel Erosion Surveys Along Taps Route, Alaska, 1975,
W77-00433 2J

TRANS-ALASKA PIPELINE SYSTEM
Oil Spill Prevention Measures for the Trans-Alaska Pipeline System,
W77-00203 5G

TRANSPIRATION
Water Relations of Glycyrrhiza Glabra L. Under Desert Conditions,
W77-00500 2I

TRANSPORT
The Physical Oceanography and Water Quality of New York Harbor and Western Long Island Sound,

TRENT BIOTIC INDEX
Biological Assessment of Water Quality Three British Rivers: The North E (Scotland), The Ivel (England) and the T (Wales),
W77-00108

TRICKLE IRRIGATION
Two-Dimensional Solutes Transfer Du Nonsteady Infiltration: Laboratory Test Mathematical Model,
W77-00288

Annotated Bibliography on Trickle Irrigatio
W77-00315

Energy Gradient Line for Drip Irrig Laterals,
W77-00318

TRIESTE
Trieste–Water Levels 1952-1971; A Stud the Tide, Mean Level, and Seiche Activity,
W77-00128

TRIETHYLTIN CHLORIDE
Evaluation of the Toxicity of Substances I Released into Water Bodies for the E Development of Fish, (In Russian),
W77-00189

TRIPTON
Nutrient Economies and Trophic Statu Lakes Sorell and Crescent, Tasm (Australia),
W77-00451

TROPHIC LEVEL
Algal Productivity in 49 Lake Waters as D mined by Algal Assays,
W77-00187

Nutrient Economies and Trophic Statu Lakes Sorell and Crescent, Tasm (Australia),
W77-00451

TROPICAL REGIONS
Causes of a Greater Effect of Predato Non-Predatory Fish Populations in Latitudes, (In Russian),
W77-00521

TROPICAL SOILS
Temperature Effects on Ammonificatio Nitrification in a Tropical Soil,
W77-00307

TROPICAL STORM AGNES
Tropical Storm Agnes Pennsylvania's T Canyon,
W77-00256

TSUNAMIS
Flood Plain Information: Resurrection and Salmon Creek, Alaska.
W77-00105

TUNNEL CONSTRUCTION
Tunnelling Machine Used for Drain Tunn Roundhill Sewage Treatment Works E Record.
W77-00069

TUNNEL DESIGN
Tunnelling Machine Used for Drain Tunn Roundhill Sewage Treatment Works E Record.
W77-00069

NNELING
Tunnelling Machine Used for Drain Tunnel for Roundhill Sewage Treatment Works Breaks Record.
W77-00069 8C

NNELING MACHINES
Tunnelling Machine Used for Drain Tunnel for Roundhill Sewage Treatment Works Breaks Record.
W77-00069 8C

RBIDITY
Qualitative Composition of the Suspended Sediments of the Ordzhonikidze Irrigation System, (In Russian),
W77-00497 2J

RBULENCE
Similarity of the Mean Motion of Fluid Particles Dispersing in a Natural Channel,
W77-00371 5B

RKEY
Towards Method Standardization: E. Coli Counts in Water Samples Using Membrane Filters, (In Turkish),
W77-00453 5A

URKMEN-SSR
Sodium Carbonate in Ground Waters of the Turkmen SSR, (In Russian),
W77-00384 3C

PIC DYSTRANDEPT SOILS
nteractions Between Organic Compounds, Minerals, and Ions in Volcanic Ash Derived Soils: I. Adsorption of Benzoate, P-OH Benzoate, Salicylate, and Phthalate Ions,
W77-00473 2G

nteractions Between Organic Compounds, Minerals, and Ions in Volcanic-Ash-Derived Soils: II. Effects of Organic Compounds on the Adsorption of Phosphate,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 2
JANUARY 15, 1977

The Library of the
MAR 7 1977
University of Illinois
at Urbana-Champaign

W77-00526 -- W77-01050
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 2
JANUARY 15, 1977

W77-00526 -- W77-01050

The Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 20 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

wo geographic parameters, elevation and titude, account for much of the spatial variation temperature and precipitation over New En-and during the winter and spring seasons. Since mperature controls the amount of precipitation hich falls as snow and is highly related to snow-elt, a spatial seasonal climatology of snow accu-ulation, melt and water input can be derived by odeling the elevation and latitude effects on tem-rature and precipitation distributions. Such a odel was developed primarily from Agricultural esearch Service Sleepers River Watershed data northern Vermont. Based only on predictor sta-on temperature and precipitation observations d on elevation and latitude differences between edictor and predictand locations, snowpack ac-mulation, melt, and water input were estimated r 10-day time steps through the snow accumula-on and melt season (2 November through 30 ay). Using a low-elevation station to estimate owpack at higher elevations, model estimations snowpack water equivalent represented a 46% provement over climatological averages. Com-rable skill was obtained in specifying water put. Skill diminished with increasing predictor-edictand distance to near zero at about 100 mi 61 km). This model enabled much of the climatic d 10-day synoptic information on snowpack ac-mulation, melt, and water input over unob-rved watersheds to be estimated from ordinary ational Weather Service network temperature d precipitation observations. COMPARISON OF SYSTEMS AND PHYSICAL HYDROLOGY APPROACHES TO HYDROLOG-IC MODELLING,
Wollongong Univ. Coll. (Australia).
M. J. Boyd.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 35 - 39, June 1976. 5fig., 2 tab, 14 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Watersheds(Basins), Water storage, Systems analysis, Optimization, Storm runoff.

In mathematical modelling of the storm rainfall-runoff process, a systems approach treats the catchment as a single unit, and utilises parameters of limited physical significance. A physical hydrology approach considers the internal properties of the catchment, and interpretation of its parameters in terms of these properties is possible. A physically-based model is presented in terms of elements identified with the watershed bounded sub-areas of the catchment. This form of structure allows storage to be allocated accurately to the model elements using measured storage properties of the corresponding sub-areas. Parameters are evaluated from the catchment properties, leaving a minimum of optimisation for final fitting. The model is developed using data from ten catchments. The response characteristics of the model are shown to be superior to those of two models based on a systems approach. (CSIRO)

STATISTICAL SENSITIVITY OF PARAME-TERS IN A RAINFALL-RUNOFF MODEL,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
R. G. Mein, and B. M. Brown.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 83 - 87, June 1976. 1 fig., 2 tab, 11 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Statistical methods, Streamflow forecasting, Watershed management, Land use, Watersheds(Basins), *Australia.
Identifiers: Thomson River(Vic).

A statistical analysis is presented whereby the statistical sensitivity of each parameter of a mathematical rainfall-runoff model can be estimated. Such an analysis is useful in assessing the potential of a mathematical model in predicting the effect of land-use change on catchment response, and the possibility of relating a models parameters to physical catchment characteristics and its consequent applicability to ungauged catchments. To illustrate the procedure, the Boughton model (with baseflow routines added) was applied to the Thomson River (Victoria, Australia). The results show that even when the model is good in predicting monthly streamflows, most of the individual parameters have a high variance, i.e. are imprecise. Indications are that, for this model at least, it would be difficult to show a statistically significant change in any single parameter due to any land use change. (CSIRO)

DEVELOPMENT OF A CONTINUOUS URBAN RAINFALL-RUNOFF MODEL,
Monash Univ., Clayton (Australia).
R. M. Wootton, and R. G. Mein.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 88 - 92, June 1976. 5 fig., 1 tab, 12 ref.

Descriptors: *Urban runoff, *Mathematical models, *Rainfall-runoff relationships, *Antecedent moisture content, Soil water movement, Infiltration, Urban hydrology, *Australia.
Identifiers: Yarralumla Creek(A.C.T.).

In order to overcome the limitations of discontinuous models of the rainfall-runoff process caused by the assumption of average antecedent conditions, a continuous model has been developed and tested using data from Yarralumla Creek catchment (Australian Capital Territory). This model simulates the soil moisture movement between storms and thus enables reasonable estimates of the antecedent conditions for any event. The infiltration component uses the Green-Ampt model, extended to simulate redistribution, and uses the Road Research Laboratory method for routing from previous and impervious areas. (CSIRO)

THE APPLICATION OF THE SACRAMENTO RAINFALL MODEL TO A LARGE ARID CATCHMENT IN WESTERN AUSTRALIA,
Snowy Mountains Engineering Corp., Cooma (Australia).
G. P. Codner, and F. M. J. Ribeny.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia,

Preprints of Papers, p. 98 - 102, June 1976. 4 fig., 3 tab., 6 ref.

Descriptors: *Arid climates, *Large watresheds, *Rainfall-runoff relationships, *Model studies, *Australia, Streamflow forecasting, Design flood, Spillways, Evapotranspiration, Antecedent moisture content, Unit hydrographs, Arid lands.
Identifiers: *Fortescue River(WA).

Use of the Sacramento rainfall runoff model is described for the Fortescue catchment in the northwest of Western Australia. The objectives of the study were the extension of the observed streamflow sequence and estimation of the spillway design flood at Gregory Gorge. These were achieved by calibrating the model, on a daily basis, on eight years of recorded data, then using the parameters in a 6-hourly version to calibrate a unit hydrograph from observed flood data. It is concluded that potential evapotranspiration estimates were less important than in a temperate climate. The amount of impervious area is important for low and medium runoff events as this represents the only runoff contribution. Flood estimates were found to be sensitive to assumptions on initial conditions of the soil moisture stores and the unit hydrograph chosen. (CSIRO)

2B. Precipitation

STATISTICAL MODELS FOR PRECIPITATION,
Kentucky Water Resources Research Inst., Lexington.
Z. Govindarajulu, P. Purdue, and F. Ciochi.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-259 270, Price codes; A03 in paper copy, A01 in microfiche. Research Report No. 96, August, 1976. 39 p, 10 tab, 13 ref. OWRT A-055-KY(1). 14-31-0001-5017. 14-34-0001-6018.

Descriptors: *Rainfall disposition, *Kentucky, *Rainfall intensity, *Simulated rainfall, *Distribution patterns, *Model studies, Precipitation(Atmospheric).

Available data consist of daily rainfall for the past 24 years (1948-1972) for Lexington, Louisville and Paducah. For Ashland the data are available for the period of 40 years (1932-1972). The problem is to find an appropriate family of distributions indexed by a suitable number of parameters that fits the maximum daily rainfall. Further, there might be seasonal variations. The following seasons were considered: (1) Dry Convective season: August 1-October 30; (2) Early Convective season: May 1-July 31; (3) Late Convective season: November 1-April 30. After extracting the yearly maximums for each of these seasons fittings were made of three distributions for each station; one for each season. The first attempt was to fit Gumbel's type I extreme value distributions, differing in location and scale parameters, to the maximum daily rainfall. However, the type I model for Louisville was rejected. Next, the Cauchy type of extreme value distribution was considered and an equation was derived. A separate model should be fitted for each of the stations, namely Lexington, Louisville, Ashland and Paducah. A separate model can also be used for each season. It seems reasonable to combine into a single season the Early and Late seasons for Lexington, the Dry and Early seasons for Louisville and Paducah, and all the seasons into a single season for Ashland.

ITERATIVE METHOD OF DETERMINING AQUIFER CONSTANTS,
Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Civil Engineering.
M. A. Gill.
Journal of the Irrigation and Drainage Division, Proceedings of ASCE, Vol. 101, Paper No. IR1, p 81-85, March 1975. 1 fig, 1 ref, 2 append.

Descriptors: *Aquifer characteristics, *Aquifers, *Aquifer testing, *Mathematical studies, *Theis equation, Methodology.
Identifiers: Iterative method.

In the proposed method, it is possible to consider as many terms in the series of the generalized equation as may be significant for calculating the aquifer constants. Therefore, the method can be considered as a refinement or extension of Jacob's method in which only the first two terms of the series are considered. It can be compared with the Theis method in which the 'match' of the drawdown curve with the type curve is obtained graphically. In the proposed method, the 'match' is obtained algebraically. The aquifer constants determined by the proposed method satisfy the generalized equation for the two selected values of s and r2/t. Because the two points are selected from a smooth curve passing through the test data, the fit generally is good at all the other points also. (Skogerboe-Colorado State)

RAINFALL VARIATIONS AS INFLUENCED BY WIND AND TOPOGRAPHY,
Michigan State Univ., East Lansing. Dept. of Agricultural Engineering.
G. E. Merva, N. D. Strommen, and E. H. Kidder.
Journal of Applied Meteorology, Vol. 15, No. 7, p 728-732, July 1976. 6 fig, 2 tab, 6 ref.

Descriptors: *Rainfall, *Rain gages, *Measurement, *Michigan, Watersheds(Basins), Precipitation(Atmospheric), Winds, Topography, Seasonal, Meteorological data, Meteorology.
Identifiers: *Rainfall variations, *Deer-Sloan Creek(Mich), Wind effects, Rain gage exposure.

Precipitation catch variation as influenced by wind direction and speed, topography, and season was examined for the Deer-Sloan Creek watershed, located about 10 mi southeast of Michigan State University, East Lansing. Data for a 10-year period from dual traverse recording rain gages, calibrated twice a year, were ranked for each precipitation event by wind direction and speed. The annual frequency distribution of first-place rankings was arrayed by wind direction and speed to assess the possible influence of surrounding terrain on gage catch. A strong correlation was found to exist between the gage exposure and the surrounding topography as a function of the first-place rankings. (Sims-ISWS)

ICE-BEARING CUMULUS CLOUD EVOLUTION: NUMERICAL SIMULATION AND GENERAL COMPARISON AGAINST OBSERVATIONS,
Rand Corp., Santa Monica, Calif.
L. R. Koenig, and F. W. Murray.
Journal of Applied Meteorology, Vol. 15, No. 7, p 747-762, July 1976. 8 fig, 24 ref, 2 append. Navy N00228-75-C-2121, NSF DES 75-03459.

Descriptors: *Model studies, *Cloud physics, *Precipitation(Atmospheric), Mathematical models, Simulation analysis, Computer models, Clouds, Drops(Fluids), Ice, Crystals, Rime, Nucleation, Particle size, Cloud seeding, Rainfall, Meteorology.
Identifiers: *Cloud models.

A two-dimensional (axisymmetric) numerical cloud model with parameterized microphysics for water drops and ice particles was described. The parameterized liquid-phase processes included condensation, evaporation, autoconversion of small drops to large ones, and collection of small drops by large ones. The solid-phase processes included heterogeneous sorption nucleation, homogeneous contact nucleation, deposition sublimation, riming and melting. Both liquid and solid particles may precipitate. The model was used to simulate three different conditions of ice generation as a function of temperature: (1) based on classical concepts of the activity of heterogeneous ice-forming nuclei--suggesting continental cumuli; (2) based on field observations of much greater concentrations of ice particles at warmer temperatures than indicated measurements of heterogeneous ice nuclei--suggesting maritime cumuli; and (3) based on nucleus seeding practice when the goal is to stimulate the growth of cumulus clouds. General comparisons of model simulation against observation were satisfactory and showed that the microphysical parameterization capture many of the observed properties of glaciating clouds with regard to the locations and sizes of liquid and solid hydrometeors. The variation of hydrometeor properties with time was reasonably satisfactory although no single simulation properly captured the sequence of hydrometeor evolution observed in maritime cumuli. The results supported the concept of dynamic seeding to stimulate cloud growth but suggested caution with regard to equating greater vertical growth and greater rainfall on the ground. (Sims-ISWS)

TRENDS AND PERIODICITIES OF RAINFALL IN SUB-DIVISIONS OF MAHARASHTRA STATE,
Meteorological Office, Poona (India).
V. K. Raghavendra.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 197-210, April 1974. 11 fig, 3 tab, 6 ref.

Descriptors: *Rainfall, *Distribution patterns, *Frequency analysis, Monsoons, Seasonal, Annual, Data processing, Rainfall disposition, Precipitation(Atmospheric), Rain, Precipitation intensity, Rainfall intensity, Meteorological data, Weather data, Analytical techniques, Meteorology.
Identifiers: *India, *Maharashtra State(India), *Rainfall trends.

The Maharashtra State of India is divided into four meteorological subdivisions, Konkan, Madhya Maharashtra, and Vidarbha. Of these, Madhya Maharashtra and Marathwada are prone to droughts. For all the subdivisions the principal rainy season is the monsoon season of June to September when over 80% of the annual rainfall is received. The coefficient of variation is about 20% for the annual and monsoon rainfall except for Marathwada where it is 25%. The annual and monsoon rainfalls follow the normal distribution for their yearly frequencies. In this State, the annual and the monsoon rainfall series are highly correlated. In the less drought-prone subdivision of Konkan, the annual and monsoon rainfalls show a 100-year cycle. In all the subdivisions the successive years' rainfalls are not dependent. The trend as revealed by fitting of orthogonal polynomials was shown as a quadratic curve for the annual and monsoon rainfalls of Konkan and Madhya Maharashtra, the subdivisions on either side of the Western Ghats. The low pass filter and Mann Kendall test against randomness confirmed the trend in Konkan rainfall. The power spectral analysis of the data indicated the existence of a long term, slow increasing trend for monsoon rainfall of Konkan and 60-year cycle for the annual rainfall of Konkan and Madhya Maharashtra, 30-year

ycle for the annual and monsoon rainfall of Vidarbha, 20nyear cycle for the monsoon rainfall of Marathwada, 15-year cycle for the monsoon rainfall of Madhya Maharashtra, 7.5-year cycle for he annual and monsoon rainfall of Marathwada. Sims-ISWS)

AN EXPERIMENT IN THE PRODUCTION OF 'POP' FORECASTS USING A STATISTICAL MODEL,
National Weather Service, Honolulu, Hawaii. Pacific Region.
G. Hirata.
NOAA Technical Memorandum NWSTM PR-15, September 1976. 16 p, 5 fig, 1 tab, 5 ref, 2 append.

Descriptors: *Statistical models, *Precipitation(Atmospheric), *Forecasting, *Rainfall, Weather data, Computer programs, *Hawaii, *Model studies.
Identifiers: 'POP' forecasts.

In November 1971, the National Weather Service in Hawaii commenced production of subjective 'POP' (probability of precipitation) forecasts for four Hawaiian weather stations: Hilo on the island of Hawaii; Kahului, Maui; Honolulu, Oahu; and Lihue, Kauai. This paper describes the method used in producing these forecasts and presents some of the results of the experiment. The computer program consisted of: a program for estimating the parameters in the logistic function (by maximum likelihood involving non-linear iterative techniques); and prediction of the probability of precipitation using estimated coefficients on current observed data. Independent parameters decided upon after testing were: sea level pressure; temperature of the air; dew point; and the presence or absence of precipitation at the time of observation. In almost all of the forecast periods, the probabilities were mainly in the lower and upper ranges, from 20-40% and 70-90% respectively, and these were quite reliable. In the mid-levels, however, the computer had a tendency to overforecast. (NOAA)

A RECORD ARKANSAS RAINFALL - THE EL DORADO DELUGE,
National Weather Service, Fort Worth, Tex. Southern Region.
K. M. Labas.
NOAA Technical Memorandum NWS SR-86, August 1976. 17 p, 5 fig.

Descriptors: *Precipitation excess, Evaporation, Convection, Meteorological data, Rainfall, Entrainment, Storms, *Arkansas, *Rainfall intensity.
Identifiers: Evaporative cooling, Convective downdrafts, El Dorado(Ark).

During the four day period 5-8 June, 1974, much of the Southern Plains and Lower Mississippi Valley was struck by a series of violent storms including killer tornadoes, severe thunderstorms and floods. One significant facet of the outbreak was the occurrence of over 18 inches (45 cm) of rain in less than 12 hours in Union County Arkansas. This phenomenal release, proceeding the absence of any apparent terrain interaction, was quite unexpected and is the subject of this investigation. The data reveals additional circumstances which were present over the impact area and may have had a significant role to play. These include: (1) a persistent dome of low theta w air near the surface in south Arkansas which was initiated by an afternoon squall meso-system and perpetuated through the night by evaporative cooling and convective downdrafts; (2) a very high and cold tropopause over the area; (3) the convective area, once formed, remained stationary with cells moving through it and; (4) massive cell diameters allowed minimal outside entrainment and maximum rain producing efficiency. The circumstance mainly responsible for the 18 inch release near El Dorado was the thrust of the moist Gulf air being lifted over the dome of low theta w air and simultaneously cooled aloft under the mid tropospheric short wave. (NOAA)

STATISTICAL, METEOROLOGICAL AND DEPTH-AREA ANALYSIS OF RAINFALL,
Israel Meteorological Service, Bet Dagan; and Israel Ministry of Transport and Communications, Tel-Aviv.
N. Rosenan, R. Markovitz, and Y. Shashua.
Final Report, (1976). 31 p, 4 tab, 17 ref. ESSA-E-4-67(N).

Descriptors: *Rainfall, *Forecasting, *Hydrologic data, *Meteorological data, Hydrology, Statistics, *Meteorology, Statistical methods.
Identifiers: International Hydrological Decade, *Mediterranean Sea, *Statistical analysis, Israel.

A research project was designed to cover several points of hydrometeorological research, for which it was thought that data available locally could be usefully applied, in order to assist in the solution of problems which are of general interest for the advancement of hydrology within the framework of the International Hydrological Decade. The program formulated provided statistical analysis of a long years (105 years) rainfall series and its application to hydrological middle-range and long-range forecasting: (1) the occurrence and disappearance of 'singularities', according to portions of the series (say, every 20 or 30 years); (2) fluctuations in the distribution of daily rainfall according to magnitude within the 105 years of record; (3) conclusion: applicability of the results to hydrological considerations. Correlations between rainfall in the Central Mediterranean and in the Eastern Mediterranean, and possible explanation by typical configurations of the 500 mb surface could give tools for long-range precipitation forecasts. ACCURACY OF EVAPOTRANSPIRATION RATES DETERMINED BY THE WATER-BUDGET METHOD, GILA RIVER FLOOD PLAIN, SOUTHEASTERN ARIZONA,
Geological Survey, Tucson, Ariz.
R. L. Hanson, and D. R. Dawdy.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $1.05. Professional Paper 655-L 1976. 35 p, 17 fig, 20 tab, 13 ref.

Descriptors: *Evapotranspiration, *Flood plains, *Arizona, *Hydrologic budget, *Statistical methods, Reliability, Vegetation, Phreatophytes, Hydrologic data, Precipitation(Atmospheric), Riparian water loss, Soil moisture, Surface-groundwater relationships, Water balance.
Identifiers: Southeastern Arizona.

Evapotranspiration by phreatophytes (primarily saltcedar) was determined by the water-budget method for 5,500 acres (2,230 ha) of the Gila River flood plain in southeastern Arizona. The water budget consists of 12 components including surface and subsurface flow through the study area, precipitation on the area, and soil-moisture changes in the unsaturated soil profile. Nine years (1963-71) of hydrologic data were collected on four reaches within the area. These data provided over 400 measurements of evapotranspiration for two- or three-week periods. Midway through the study the vegetation was removed from the flood plain. The evapotranspiration measurements are therefore defined for both natural vegetative cover and essentially bareground conditions. This report shows how each component of the water budget was evaluated, demonstrates the significance of each component in relation to the total evapotranspiration, and describes the methods used to evaluate the relative accuracy of each component. The two most significant components of the water budget are, generally, the Gila River inflow and outflow. One of the least significant is tributary inflow, which occurred only 4 percent of the time during the 9-year study. Large computed measurement errors are shown to overestimate substantially the true measurement variable in evapotranspiration. The computed errors do give, however, a good indication of the relative significance of each evapotranspiration value and provide a means of selecting those values which should be used in computing average evapotranspiration rates. (Woodard-USGS)

2E. Streamflow and Runoff

A STABLE ESTIMATOR FOR LINEAR MODELS: 2. REAL WORLD HYDROLOGIC APPLICATIONS,
Pavia Univ. (Italy).
L. Natale, and E. Todini.
Water Resources Research, Vol. 12, No. 4, p 672-676, August 1976. 7 fig, 4 ref.

Descriptors: *Unit hydrographs, *Flood routing, Hydrology, *Estimating, Surface runoff, Rainfall-runoff relationships, Forecasting, Analytical techniques, Equations, Model studies, Hydrologic data, *Model studies.
Identifiers: *Arno basin, *Sieve River, *Italy, Constrained estimator, Linear model.

Two examples flood routing through a confluence of two watercourses of the Arno basin and the rainfall-runoff process in the Sieve River basin, were presented to illustrate the application of a stable estimator for linear models. Six flood hydrographs were considered for the Arno basin, and the instantaneous unit hydrographs were obtained for the two watercourses assuming the phenomenon of wave propagation in the drainage network as linear. A constrained stable estimator was shown to yield the best results in evaluating the parameters. In the Sieve River basin, effective rainfall hyetographs and the surface runoff hydrographs were affected by errors because of the usual and somehow arbitrary methods used to separate the surface components of the inflow and outflow discharges. Mean instantaneous unit hydrographs were determined for both constrained and unconstrained estimators by using four to eight rainfall-runoff events. A constant superiority for the constrained estimator was demonstrated. (See also W77-00123) (Singh-ISWS)

FREE SURFACE FLOW IN A CHANNEL OF LARGE RELATIVE ROUGHNESS,
Technical Univ. of Istanbul (Turkey), Dept. of Hydraulics and Water Power.
M. Bayazit.
Journal of Hydraulic Research, Vol. 14, No. 2, p 115-126, 1976. 11 fig, 23 ref.

Descriptors: *Roughness(Hydraulic), *OPen channel flow, *Laboratory tests, *Boundary layer, Viscosity, Hydraulics, Analytical techniques, Turbulence, Flumes, Statistics, Equations, Flow, Friction.
Identifiers: *Hemispherical roughness elements, Velocity distribution, Relative roughness, Equivalent sand roughness.

Characteristics of free surface flow over a bed consisting of hemispherical roughness elements were studied in a laboratory model. Theoretical bottom of the channel was located at a distance of 35% of the diameter below the tops of hemispheres. Usual logarithmic laws were valid for velocity distribution and friction factor as long as flow depth was large relative to roughness height. Equivalent sand roughness of the bottom was equal to 2.5 times the diameter of hemispheres. At large values of relative roughness on the other hand, lower velocities were observed than the logarithmic law predicts, and friction factor also increased by as much as 50%. Intensity of turbulence fluctuations decreased with the increase of relative roughness. Probability density function of velocity fluctuations near the rough bed tended away from the normal distribution. (Singh-ISWS)

HISTORY OF IRRIGATION AND CHARACTERISTICS OF STREAMFLOW IN NEBRASKA PART OF THE NORTH AND SOUTH PLATTE RIVER BASINS,
Geological Survey, Lincoln, Nebr.
F. B. Shaffer.
Open-file report 76-167, June 1976. 98 p, 10 fig, 14 ref.

Descriptors: *Streamflow, *Flow rates, *Irrigation canals, *Surface waters, *Nebraska, Hydrologic data, Flow characteristics, Probability, Statistical methods, Diversion, Irrigation, Water rights, History.

Statistics on streamflow for selected periods of time are presented for 28 gaging sites in the Nebraska part of the North and South Platte River basins. Monthly mean discharges, monthly means in percent of annual runoff, standard deviations, coefficients of variation, and monthly extremes are given. Also tabulated are probabilities of high discharges for 1 day and for 3, 7, 15, 30, and 60 consecutive days and of low discharges for 1 day and for 3, 7, 14, 30, and 60 consecutive days. All statistics are based on records that are representative of 1973 conditions of streamflow. Brief historical data are given for 27 of the principal irrigation canals diverting from the North and South Platte Rivers. (Woodard-USGS)

nels, *Channel morphology, *Flow rates, *Flo
discharge, Flash floods, Flood routing, Veloci
Meanders, Reservoir operation, Evaluatio
*Arizona.
Identifiers: *Gila River(Ariz), *Safford V
ley(Ariz), Flood-wave timing.

The stream channel of the Gila River in Saffo
Valley, Ariz., is wide and straight at ends
periods in which high flows were dominant and
narrow and has a meander pattern at ends
periods in which low flows were dominant; the
fore, the size and meander pattern of the stre
channel are regarded as having been determin
by past dominant flows. The stream-channel a
flood-plain system, when fully developed for
dominant flow, has a persistent characteristic
regard to its effect on floods. A low-flow syst
reduces flood rates; peak flows of flash floo
may be reduced to bankfull discharge. A high-fl
system does not increase flood rates; howeve
streamflow from tributaries may contribute mo
significantly to peak rates when a high-fl
system is in effect than when a low-flow system
in effect. At the downstream end of the stu
reach, the annual peak flows reflect the effects
the persistent characteristic of the upstre
system and, therefore, are not random in time.
high-flow system was in effect during 1914-27
low-flow system began developing after abo
1930. The downstream velocity of the center
mass of floodwaves that had peak discharges
between 10,000 and 20,000 cubic feet per seco
during 1914-27 may have been three times that
the same rates during 1943-70. (Woodard-USGS)

.. J. Morris.
n: Hydrology Symposium, Sydney, Australia, 976. The Institution of Engineers Australia, reprints of Papers, p. 45 - 49, June 1976. 1 fig., 1 ab., 6 ref.

Descriptors: *Mathematical models, *Streamflow orecasting, *Flood routing, *Urban runoff, Computer models, Urban hydrology, Storm runoff, Channel flow, Roughness(Hydraulic), Unit hydrographs, Backwater, *Australia.
Identifiers: Brisbane(Qld.).

During a general study of flooding problems in reeks traversing the developed area of Brisbane Australia), a suite of computer programmes was roduced to give effect to a general mathematical odel. The model blends hydraulics with hydrology in using backwater profiles with flood routing nd variable unitgraph techniques. The balance etween hydrology and hydraulics has been found o be self-correcting to a degree, in that if the flow s consistently incorrect (e.g. a low initial rating urve), the roughness coefficients will be estiated high. The net result is that over a medium ange of flows the levels will be within an acceptale error margin. Details of the model and its comonent programmes are given, with some examles of its use. Identifiers: Proximate causation, Injunctive relief, Intentional torts.

Plaintiff owners of lower residential land brought suit for damages and injunctive relief against a developer-owner of higher lands alleging alterations of surface water drainage. The Ohio Court of Appeals held that an owner of a dominant urban estate cannot without liability alter natural watercourses on his property so that surface water flowing onto a subservient estate is so increased in volume or intensity as to damage that estate. An award of punitive damages was allowed. (Reinders-Florida)

PARAMETER IDENTIFICATION IN AN INHOMOGENEOUS MEDIUM WITH THE FINITE-ELEMENT METHOD,
California Univ., Los Angeles.
Y. S. Yoon, and W. W-G. Yeh.
Society of Petroleum Engineers Journal, Vol. 16, No. 4, p 217-226, August 1976. 3 fig, 2 tab, 34 ref.
UCLA-WRC-W-290.

Descriptors: *Aquifer characteristics, *Permeability , *Heterogeneity, *Finite element analysis, Numerical analysis, Mathematical models, Optimization, Unsteady flow, Groundwater movement, Dupuit-Forchheimer theory, Porous media, Least squares method, Boundaries(Surfaces), Equations.
Identifiers: *Inverse problem, Parameter identification, Galerkin method, Predictor-corrector technique, Indirect method, Effective porosity, Gauss-Newton method.

The development of a systematic procedure for solving the problem of parameter identification was studied. The parameter function to be identified was the permeability embedded in nonlinear, partial differential equation of parabolic type. Finite elments were used to represent the unknown function parametrically in terms of nodal values over a suitable discretization of a flow region. These nodal values were then determined by a least-squares fitting between the observed and calculated flow potentials, subject to linear inequality constraints imposed upon the parameters to be identified. To handle such constraints, Rosen's gradient projection technique was combined with the Gauss-Newton method. Numerical procedures were presented for the solution of the partial differential equation using the Galerkin method and a predictor-corrector approach. Simultaneous identification of 25 parameters embedded in a two-dimensional, nonlnear, diffusion-type equation was demonstrated by two examples. (Visocky-ISWS)

EVALUATING GROUND-WATER PATHS USING HYDRAULIC CONDUCTIVITIES,
Agricultural Research Service, Chickasha, Okla. Texas-Oklahoma Area.
J. W. Naney, D.C. Kent, and E. H. Seely.
Ground Water, Vol. 14, No. 4, p 205-213, July-August 1976. 14 fig, 13 ref.

Descriptors: *Hydraulic conductivity, *Groundwater, *Oklahoma, *Groundwater movement, *Hydrogeology, Effluent streams, Flow nets, Mathematical models, Watersheds(Basins), Subsurface flow, On-site investigations, Computer programs, Potentiometric level, Seepage, Mapping, Cores, Pump testing, Particle size, Permeameters, Model studies.
Identifiers: *Flow paths(Groundwater), Residual maps, Streamtubes.

A method was presented for selecting groundwater flow paths by comparing modeled and measured hydraulic conductivity distributions. A flow chart was included which shows the steps followed in selecting the concept of roundwater flow which best fits measured hydrogeologic conditions. Both noneffluent and effluent stream conditions were evaluated using the method. Residual maps of hydraulic conductivity were used to show how modeled hydraulic conductivity may be as much as 300 times that expected when the wrong concept is used. Flow nets of modeled and measured data downstream from a flood-water-retarding structure were developed using the selected hydrogeologic conditions. Fitting hydraulic conductivity data resulted in a distribution of groundwater flow paths which better represent actual flow conditions. The method provided a unique means of calibrating a model in a pilot test area and applying it to geologically similar nearby watersheds. It was also useful for checking paths of subsurface flow where flow distribution is important as it is in the movement of chemical pollutants or nutrients from a source of recharge, such as a watershed impoundment, to downstream waters. HYDROGEOPHYSICAL EQUIVALENCE OF WATER SALINITY, POROSITY AND MATRIX CONDUCTION IN ARENACEOUS AQUIFERS,
National Physical Research Lab., Pretoria (South Africa). Geophysics Div.
P. F. Worthington.
Ground Water, Vol. 14, No. 4, p 224-232, July-August 1976. 4 fig, 9 ref.

Descriptors: *Resistivity, *Salinity, *Porosity, *Sand aquifers, Sands, Sandstones, Geophysics, Aquifer characteristics, Sodium chloride, Conduction, Equations, Groundwater, Mapping, Curves, Heterogeneity, Graphical analysis, Hydrogeology.
Identifiers: Formation factor, Rock matrix.

The value of the electrical resistivity method as a quantitative indicator of groundwater resistivity, porosity, and effective matrix resistivity was examined through the equivalence of these parameters as manifested in the surface-measured resistivity of heterogeneous water-saturated sands. It was demonstrated that, where there were unknown variations in porosity, the mapping of groundwater resistivity was most feasible at lower salinities and where porosity was relatively high. Porosity could be determined most exactly at lower values and where groundwater salinity was relatively high. Both of these approaches became less efficient as matrix conduction increased. The mapping of effective matrix resistivity was best effected at lower values where this parameter could be approximately monitored against moderate variations in both porosity and groundwater resistivity. In general, however, where there were unknown and pronounced variations in any two of these parameters, the geoelectrical determination of the third could be so ambiguous that the uncertainty in the estimated value of this parameter could exceed the total range of values encountered in an entire formation. HYDROGEOLOGY OF A DRIFT FILLED BEDROCK VALLEY NEAR LINO LAKES, ANOKA COUNTY, MINNESOTA,
Geological Survey, Denver, Colo.
T. C. Winter, and H. O. Pfannkuch.
Journal of Research of the U. S. Geological Survey, Vol 4, No 3, p 267-276, May-June 1976. 8 fig, 2 tab, 10 ref.

Descriptors: *Hydrogeology, *Groundwater movement, *Glacial aquifers, *Minnesota, Data collections, Observation wells, Aquifer characteristics, Surface-groundwater relationships, Water levels, Groundwater recharge, Transmissivity, Hydraulic conductivity.
Identifiers: *Anoka County(Minn), Bedrock valleys.

The bedrock surface of east-central Minnesota is dissected by an intricate network of valleys. These valleys, as much as several hundred feet deep and filled with drift, dissect important sandstone and carbonate-rock aquifers of lower Paleozoic age. A small segment of one of the valleys, in southeastern Anoka County (test site A), is about 335 ft deep and 260 ft below the bedrock surface. Outside the bedrock valley at site B, 3 mi from site A, 100 ft of drift overlies the bedrock surface. Observation wells were installed at the two sites to determine the vertical ground-water movement between the various aquifer units and the lateral movement between the two sites. An aquifer test of the lowest valley-fill aquifer at site A showed that the observation well completed in the same aquifer as the pumping well responded immediately; whereas a lag of about 100 min occurred between the lower valley fill and upper-most body of sand and gravel. This indicates that the hydraulic connection between these two layers is poor at the immediate site. Test results show that the lower sand-and-gravel aquifer has a transmissivity between 14,000 and 27,000 sq ft/d. Laboratory analyses of drill cuttings show fair agreement with the hydraulic conductivity derived from aquifer-test analyses. Water-level data for a 2-yr period indicate that there are no reversals in ground-water potential with time. (Woodard-USGS)

COMPUTER SIMULATION MODEL OF THE PLEISTOCENE VALLEYFILL AQUIFER IN SOUTHWESTERN ESSEX AND SOUTHEASTERN MORRIS COUNTIES, NEW JERSEY,
Geological Survey, Trenton, N. J.
H. Meisler.
Water-Resources Investigations 76-25, May 1976. 70 p, 3 fig, 1 plate, 3 tab, 14 ref.

Descriptors: *Aquifers, *Hydraulic properties, *Computer models, *Groundwater movement, Aquifer characteristics, *New Jersey, Pleistocene Epoch, Sands, Storage coefficient, Specific yield, Transmissivity, Water wells, Water yield, Glacial drift, Till, Gravels.
Identifiers: Passaic River(NJ), Morris County(NJ), Essex County(NJ), Newark group, Valley fill.

A finite-difference digital computer model was developed to simulate a buried valley-fill aquifer consisting of outwash sand and gravel deposited in a series of valleys cut into bedrock of Triassic age. Till, clay, silt, and muck function as an overlying semiconfining layer. The bedrock which is represented as an unconfined aquifer and the valley fill are in hydraulic connection. Calibration of the model was achieved by comparing model-computed water-level declines with measured declines at 12 observation wells during the period 1953-71. During calibration, changes in several hydraulic properties were tested. The most significant changes were changes in hydraulic conductivity of the semiconfining layer. The amount of water available from the valley-fill aquifer on a continuing basis, determined using the criterion that water levels would not decline below 30 feet above the base of the aquifer, is approximately 40 Mgal/d or about 40 percent more than the 1972-73 withdrawal rates. (Woodard-USGS)

GEOLOGY AND GROUND-WATER RESOURCES OF CAMDEN COUNTY, NEW JERSEY,
Geological Survey, Trenton, N. J.
G. M. Farlekas, B. Nemickas, and H. E. Gill.
Water-Resources Investigations 76-76, June 1976. 146 p, 50 fig, 14 tab, 84 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *New Jersey, Pumping, Drawdown, Water yield, Water utilization, Water wells, Chemical analysis, Groundwater recharge, Groundwater movement, Saline water intrusion, Atlantic coastal plain.
Identifiers: *Camden County(NJ).

The major fresh water aquifers in Camden County, N. J., are in the unconsolidated sediments of Cretaceous and Tertiary age. The major aquifers are the sand and gravel units in the Potomac Group and the Raritan and Magothy Formations, the Cohansey Sand, the Wenonah Formation-Mount Laurel Sand, and the Englishtown Formation. The average ground-water use for Camden County was 68 million gallons per day for 1966. All of the major artesian aquifers have had potentiometric head declines due to ground-water withdrawals. The largest water-level decline occurred in the aquifer system in the Potomac Group and the Raritan and Magothy Formations. At Haddon Heights the potentiometric head declined over 110 feet from 1900 to 1968. In the aquifer in the Wenonah Formation-Mount Laurel Sand the potentiometric head declined 43 feet in about 60 years. The quality of ground water is generally good. In the southeastern portion of the county chloride concentrations in excess of 250 mg/liter occur in the Potomac-Raritan-Magothy aquifer system. The high chloride water has remained in the aquifer system from the time of deposition or has re-entered the system from the ocean after the changes in sea level. The greatest potential of future ground-water development is from the Cohansey Sand which is under water table conditions. It also may have the greatest possibility of local ground-water contamination. (Woodard-USGS)

Identifiers: *Pearson Type VIII distribution fun tion, *Pore-size distribution function, Imbibition

Based upon the Pearson Type VIII distributi function, a general retention function which lates the saturation to the capillary pressure disturbed soils has been discovered. This simp and yet complete function has been shown describe precisely the imhibition as well as t drainage branch of the retention curve. It defined by four readily assessed parameters th either have physical significance themselves may be used to determine some hydraulic prope ties of the soil. With the assumption that the Bu dine integrals are adequate, a relative permeabili function has been derived through the substituti of the retention function for the integrands in t Burdine integrals. The permeability function is e pressed in terms of the incomplete Beta functi ratio whose value may be conveniently found some mathematical tables. Further, a general por size distribution function of soils has been o tained from the retention function. The derivati of the pore-size distribution function enables mo rigorous examination and further exploration the theories concerning water movement in pa tially saturated soils. In this respect, and explan tion of the phenomenon of air entrapment duri imbibition has been offered through an ener concept based upon the pore-size distributi function along with the retention function.

URFACE NORMAL MODES OF LAKE MICHIGAN: CALCULATIONS COMPARED WITH SPECTRA OF OBSERVED WATER EVEL FLUCTUATIONS,
lational Oceanic and Atmospheric Administraion, Ann Arbor, Mich. Great Lakes Environmenal Research Lab.
). B. Rao, C. H. Mortimer, and D. J. Schwab.
Journal of Physical Oceanography, Vol. 6, No. 4, p 575-588, July 1976. 9 fig, 4 tab, 11 ref.

Descriptors: *Water level fluctuations, *Lake Michigan, *Lakes, *Wisconsin, *Model studies, Mathematical models, Water levels, Bays, Tides, Seiches, Fluctuations, Limnology.
Identifiers: *Water oscillations, *Green Bay(Wis), Surface normal modes, Spectra of water levels, Galerkin method.

Periods and structures of several normal modes of Lake Michigan (including Green Bay) were calculated theoretically, taking into account the Lake's topography and the earth's rotation. The calculations were based on a Galerkin method developed by Rao and Schwab. Even though the calculations gave both rotational and gravitational modes, attention was focused primarily on the latter. The calculations showed that there were several modes dominant in the main basin of Lake Michigan and some dominant in Green Bay. The lowest Lake Michigan mode had a period of 9.27 h. Green Bay exhibited a (co-oscillating or Hemlholtz) mode with a period 10.35 h. For the modes dominant in the main basin, the periods and structures obtained from theoretical calculations were compared to those deduced from spectral analyses of water level data from various stations around the Lake. The agreement was found satisfactory for several of the lowest modes. (Sims-ISWS)

AQUATIC OLIGOCHAETA RECOREDED FROM CANADA AND THE ST. LAWRENCE GREAT LAKES,
Department of the Environment, Victoria (British Columbia). Inst. of Ocean Sciences.
R. O. Brinkhurst.
Pacific Marine Science Report 76-4, January 1976. 51 p. 7 plates, 20 ref.

Descriptors: *Aquatic animals, *Canada, *Oligochaetes, *Systematics, Speciation, Tubificids, *Annelids, Worms, *Great Lakes.
Identifiers: *Lumbriculidae, *Haplotaxidae. *Naididae.

A systematic classification of annelids (Oligochaeta), including Lumbriculidae, Haplotaxidae and Naididae found in Canada is presented. It gives the Canadian locale where found, a description of familial characteristics, and a guide to identification of the various species. Plates illustrate setae, penes, and proboscises. INDEPENDENCE OF THE BIOCHEMICAL AND SPECIES COMPOSITION OF PLANKTON OF THE MINGECHAUR AND VARVARA RESERVOIRS, (IN RUSSIAN),
S. B. Gadzhieva.
Izv Akad Nauk Az Ssr Ser Biol Nauk 4, p 72-79, 1974.

Descriptors: *Biochemistry, *Copepods, *Zooplankton, Reservoirs, *Daphnia, *Phytoplankton.
Identifiers: Arctodiaptomus-acutilobatus, Azerbaijan-SSR, Cyclops-vicinus, Daphnia-longispina-hyalina, Diaphanosoma-brachyurum, Macrocyclops-fuscus, Mesocyclops-dybowskii, Sinodiaptomus-sarsi, USSR, *Mingechaur Reservoir(USSR), *Varvara Reservoir(USSR).

Data are presented on the biochemical composition and calorific values of the dominant species or groups of species of plankton in the Mingechaur and Varvara reservoirs in the Azerbaijan SSR (USSR): Diatomeae, Nitzschia, Diaphanosoma brachyurum, Daphnia longispina hyaiina, Sindiaptomus sarsi, Arctodiaptomus acutilobatus, Mesocyclops dybowskii, Cyclops vicinus, Macrocyclops fuscus and nauplii of copepods. The calorific value of the zooplankton was almost twice higher than that of the phytoplankton; if the average calorific value of the phytoplankton was equal to 2.45, then that of copepods was 4.78 and of cladocerans 4.67 kcal/g dry matter.

EFFECT OF YEAST AND COBALT CHLORIDE IN INCREASING SURVIVAL RATE OF HATCHLINGS OF HETEROPNEUSTES FOSSILS (BLOCH),
Central Inland Fisheries Research Inst., Jaipur (India). All-India Co-ordinated Research Project.
H. A. Khan, and S. K. Mukhopadhyay.
Indian J Anim Sci. 43(6), p 540-542, 1973.

Descriptors: *Yeasts, *Chlorides, Fish food organisms, Fish hatcheries, Plankton, Mortality.
Identifiers: *Cyclops, *Heteropneustes-Fossilis, *Cobalt chloride.

The survival of hatchlings of H. fossilis (Bloch) is very poor, especially in the 1st 2 wk. This may be because of shortage of choice food, depradation by Cyclops and cannibalism. While feeding the fish with live plankton, an application of yeast (0.05 g/l) and cobalt chloride (1 ppm) in the water enhance the survival rate of the hatchlings up to 80%. The experimental procedure for this is discussed in detail.--Copyright 1975, Biological Abstracts, Inc.

Density stratification in lakes and oceans generate anoxic conditions below the pycnocline, and sediment facies mirror this development. A comparison of modern sediments deposited in stratified and non-stratified waters with sediments formed since the Cambrian revealed that the ancient sea has been stratified a number of times. Descriptors: *Stream erosion, *Bank erosion, *Sediment transport, *Tractive forces, Fluid mechanics, Hydraulics, Natural streams, Steady flow, Uniform flow, Viscous flow, Analytical techniques, Open channel flow.
Identifiers: *Fredholm integral equation, Rectangular channels.

The steady uniform flow in alluvial channel of rectangular cross section with a partially eroding bed is considered. The wetted perimeter is divided into an inner region in which the known critical tractive forces are exceeded, surrounded by a region where the fluid velocity is known to vanish. The free surface is free from shear. This mixed boundary value problem is formulated in terms of a dual series which leads to the solution of a Fredholm integral equation of the second kind. This solution determines the extent of the eroding zone and the distribution of the bed-slip velocity. Particular solutions that include the distribution of isotachs and boundary unit tractive forces are presented for the case of incipient erosion at the bed center, and for the case of a fully eroding bed. Numerical results of the quantities of practical interest are reported. (ARS)

PROCEEDINGS OF THE THIRD FEDERAL INTER-AGENCY SEDIMENTATION CONFERENCE 1976.
Water Resources Council, Washington, D.C. Sedimentation Committee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 100, Price codes: A99 in paper copy, A01 in microfiche.
Report SEDCOM-03, Preprints for a conference held March 22-25, 1976, Denver, Colorado. Sedimentation Committee of the Water Resource Council, Washington, D.C., December 1975. 974 p.

Descriptors: *Sedimentation, *Sediment transport, *Erosion, *Surface runoff, *Conferences, Sediment control, Erosion control, Sediments, Deposition(Sediments), Suspended solids, Rivers, Streams, Coasts, Estuaries, Watersheds(Basins), Forests, Channel improvement, Urban runoff, Physical properties, Chemical properties, Instrumentation, Equipment, Sedimentology.

In the 13 years since the last conference, there has been a large amount of research and development work. The work group recommended that a third conference be held in March 1976. Of the 130 workers in sedimentation who indicated a willingness to prepare and present papers at this Third Federal Inter-Agency Conference on Sedimentation, the committee accepted about 80 papers for publication in the proceedings. The broad topics covered were the following: Sediment yield and sources; Erosion and sediment control; Physical and chemical properties of sediment; Sediment transport and deposition; Channel adjustments; Coastal zone sedimentation; and Instrumentation. (See W77-00776 thru W77-00845) (Sims-ISWS)

EROSION POTENTIAL OF SOILS,
Soil Conservation Service, Washington, D.C. Soil Survey Interpretations Div.
K. K. Young.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-1 - 1-10, 1976. 12 ref.

Descriptors: *Erosion, *Soil erosion, *Farm management, *Urbanization, Farms, Cities, Environment, Land use, Soils, Soil surveys, Soil texture, Organic matter, Soil structure, Soil conservation, Permeability, Crops, Structures.
Identifiers: *Erosion potential, Soil loss equation, Soil erodibility factor.

Erosion and sediment from farmland remains a serious problem in the United States. Gaining national concern is the erosion and sediment resulting from urban development. Predicting the erosion potential of soils is one of the first steps used by the Soil Conservation Service in planning conservation systems that control soil erosion on farmland and urban developments alike. This paper described the application of research to produce a practical field procedure for determining the erosion potential of soils. Special emphasis was given to the soil factors that influence erosion and to how soil surveys are used to predict the areas of potential erosion. (See also W77-00775) (Sims-ISWS)

Deposition measurements in 48 northern Calif
nia reservoirs were found related to precipitati
amount, rain-snow frequency, road standards a
location, forest fires, geology, and physiograph
and also to differences among watershe
(catchments) in landslide classes, extent of geol
ic faults, clay content of watershed soils, and d
sity of reservoir sedimentation. The data w
analyzed by reduced rank principal compone
techniques. The final regression equation had
explained variance of 0.86 and a standard error
0.138 log units. Difference in average ann
deposition associated with reservoir density w
39%; with landslides, 100%; with faults, 41%; a
with clay in watershed soils, 32%. Some geolo
rock types with geologic faults and high landsli
potential had a predicted sediment rate as much
17 times that of areas without faults. Ro
located near streams contributed the most
deposition– twice as much as did roads located
sewhere, and improved secondary roads n
streams were the single greatest contributor, es
cially in areas of steep terrain. Roads in st
topography produced twice as much accelerati
in sedimentation as did those in less steep terra
Preliminary appraisal of bedload (differen
between reservoir deposition and suspended se
ment discharge) indicated that it varies from 9
to less than 20% of 'total load' in different are

entifiers: *Birch Lake(Wis), *Trout Creek(Wis),
wa County(Wis).

During March 1975, a reservoir sediment survey was made at Birch Lake, Iowa County, Wisconsin. Twenty-three bottom sediment samples were collected through the ice along eight ranges in the lake. Two ranges were augered on the flood plain of Trout Creek above the impoundment. The samples were first described in the field, and then selected portions of core profiles were analyzed for physical and chemical properties. The volume and density of a 10.5-year accumulation of sediment in the reservoir were determined. The sediment survey indicated an average annual sediment yield in 10.5 years of 3.45 metric tons/ha (1.54 tons/acre) as compared with a predicted average annual yield of 1.88 metric tons/ha (0.84 tons/acre) in 1960 prior to dam construction and 1.59 metric tons/ha (0.71 tons/acre) in 1974. The watershed was predominantly cropland and pasture. Land use and land treatment were compared prior to dam construction and in 1974. Comparisons were made between predicted watershed sediment yield and the measured sediment in the reservoir. This study is a basis for future land use, land treatment, and sediment surveys at 5-year intervals. (See also W77-00775) (Sims-ISWS)

SEDIMENT YIELD FROM STEEP LANDS IN THE DRIFTLESS AREA,
North Central Forest Experiment Station, La Crosse, Wis. Watershed Lab.
R. S. Sartz.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-123 - 1-131, 1976. 4 fig, 4 tab, 8 ref.

Descriptors: *Sediment yield, *Suspended solids, *Erosion, *Wisconsin, Forests, Cultivated lands, Pastures, Grazing, Surveys, Sampling, Data processing, Watersheds(Basins), Storms, Runoff, Storm runoff, Gullies, Soil erosion, Sediments, Sediment discharge.

Data from four years of experimentation were summarized: Suspended sediment in runoff water was measured on natural runoff plots and small watersheds in different land uses on southwestern Wisconsin's ridge and valley lands. Substantial amounts of sediment were discharged only from cultivated or heavily grazed catchments. The greatest amounts--sometimes exceeding 200,000 ppm--came from tilled cropland in early stages of crop development. Values varied greatly from one catchment to another, probably because of differences in erosion patterns that developed under tillage and because of differences in cover density. Some additional observations were made on sediment movement: Ungrazed forest and prairie in the Driftless Area yield no significant amounts of runoff or sediment, regardless of slope steepness, unless they intercept water from overlying fields. However, field runoff can carve huge gullies on forested slopes that lie below cultivated uplands. Thus, the forested slopes of the area have been a major sediment source from gully erosion since the time of agricultural settlement. (See also W77-00775) (Sims-ISWS)

Descriptors: *Sediment yield, *Watersheds(Basins), *Hawaii, *Mineralogy, Surveys, Sampling, Runoff, Rainfall, Sediments, Clays, Silts, Sands, Soils, Erosion, Geology, Vegetation, Slopes, Clay minerals, Coasts, Estuaries.

The mineral composition, as well as the texture of Hawaiian watershed and coastal sediments, are dependent on various parameters. Geology, climatology, vegetation, stream slope and channel morphology, bathymetry, and cultural activities, are all important. Hawaiian streams enter the ocean basin through one of the following kinds of environment: estuaries, bays, lagoons, or mouths of tidal streams. The coastal environments serve as temporary sinks for tidal streams. The coastal environments serve as temporary sinks for the sediments. Four representative watershed coastal environments from Oahu were selected for detailed study. They were Kahana, Kaneohe, Hawaii Kai, and Pearl Harbor. Kahana stream had the lowest sediment yield, compared with the stream in the urbanizing area. Kipapa Stream (Pearl Harbor Basin) had the highest sediment yield. (See also W77-00775) (Sims-ISWS)

Identifiers: *Erosion processes, Interrill erosion.

The complementary processes of soil erosion and sedimentation involve a complex interrelationship of many factors that influence detachment, transportation, and deposition of soil particles. Recent research has provided knowledge useful for developing improved concepts concerning these processes and for allaying certain misconceptions about them. In this paper, current concepts of the process of soil erosion by water were presented. Their implications as a basis for continued improvements in erosion prediction and control were discussed. Research deficiencies were indicated, and promising new approaches were explored. (See also W77-00775) (Sims-ISWS)

THE UNIVERSAL SOIL LOSS EQUATION AS ADAPTED TO THE PACIFIC NORTHWEST,
Washington State Univ., Pullman. Agricultural Research Center.
D. K. McCool, R. I. Papendick, and F. L. Brooks.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 2-135 - 2-147, 1976. 4 fig, 1 tab, 15 ref.

Descriptors: *Soil erosion, *Pacific Northwest U. S., *Agricultural runoff, Equations, Regression analysis, Temperature, Topography, Soils, Slopes, Crops, Adaptation, Farm management, Erosion, Sediments, Rainfall, Runoff.
Identifiers: Universal Soil Loss Equation.

Use of the Universal Soil Loss Equation for soil loss prediction in the Pacific Northwest has been limited by inapplicable relationships for the factors of the equation. A first-generation adaptation of the equation was made by developing new relationships to fit Pacific Northwest conditions. These included (1) a slope length-steepness relationship to account for steeper slopes (greater than 20%) and runoff-induced erosion; (2) a runoff-rainfall erosion factor that accounts for effects on soil loss of climatic phenomena peculiar to the region, i.e., low intensity rainfall, snowmelt, and rain or snowmelt on frozen ground; and (3) first-approximation crop management factors to fit the region. The Soil Conservation Service is field testing the adaptation. (See also W77-00775) (Sims-ISWS)

SUSPENDED SEDIMENT, SOLAR RADIATION AND HEAT IN AGRICULTURAL RESERVOIRS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
F. R. Schiebe, J. C. Ritchie, and J. R. McHenry.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 3-1 - 3-12, 1976. 5 fig, 2 tab, 4 ref.

Descriptors: *Sediments, *Solar radiation, *Water temperature, *Reservoirs, *Mississippi, Heat budget, Energy budget, Temperature, Reflectance, Heat transfer, Lakes, Equations, Secchi disks, Suspended solids, Albedo, Air-water interfaces, Radiation, Meteorology.

Comparative studies conducted on two adjacent northern Mississippi reservoirs showed that the suspended sediment has a measurable effect on the surface water temperature. Spectroradiometer measurements of reflected solar radiation from waters with different concentrations of suspended sediment indicated that up to 4 times as much energy is reflected from a reservoir with 200-ppm sediment concentrations than is radiated from an adjacent reservoir with 50-ppm concentrations. Epilimnion temperature measurements indicated a 1 to 4 C difference with clearer waters always warmer. Energy budget equations consistent with the experimental findings showed that if turbid waters reflect more energy, then the temperature of these surface waters is cooler than that of clear water. EFFECT OF AN ARTIFICIALLY INCREASED SAND BEDLOAD ON STREAM MORPHOLOGY AND ITS IMPLICATIONS ON FISH HABITAT,
North Central Forest Experiment Station, Rhinelander, Wis. Inst. of Forest Genetics.
E. A. Hansen, and G. R. Alexander.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 3-65 - 3-76, 1976. 6 fig, 3 tab, 3 ref.

Descriptors: *Sands, *Bed load, *Sediments, *Michigan, *Habitats, Fish, *Trout, Brook trout, Fish populations, Habitat improvement, Scour, Channel morphology, Streams, Water temperature, Depth, Sand waves, Streambeds, Water pollution effects.
Identifiers: Added sands, Increased sand bedloads.

Sand sediment was added daily for nearly four years to a low gradient Michigan trout stream to

mine effects on stream morphology, water erature, and, ultimately, the trout population. sand input was adjusted so that the average ent concentration was increased by a factor ur over the pretreatment concentration of 20 . Sediment discharge was measured just up- m of the sand input point, and also at the r end of the treated section, 1.6 km (1 mile) stream. Permanent stream cross-section sta- were spaced at 30-m (100 ft) intervals along .6 km (1 mile) control and treated sections to tate the measurement of channel changes. rout population was inventoried twice a year termine its response to the increased sand ad. The added sand with its resultant mbed aggradation produced increases in m gradient and width, and decreases in m depth and in the total static volume of r. The stream gradient and channel form were uniform throughout the treated reach due to filling. Streambed composition changed sub- ially; gravel areas decreased, sand areas in- ed. Water temperatures were slightly warmer mmer cooler in winter due, presumably, to vider, shallower stream. The impact of these ges on the trout population will be reported at r date to allow time for population responses, y, to occur. (See also W77-00775) (Sims- S)

riptors: *Model studies, *Streambeds, iment transport, *Hydraulic models, Mathe- al models, Laboratory tests, Flow, Drag, olds number, Loads(Forces), Sands, Equa- , Silts, Sediments, Sedimentation.
ifiers: *Time-mean drag coefficient.

ie-mean drag coefficient for a streambed par- was derived from considerations of flow- rated force moments and particle packing etry. The drag coefficient was taken as a ion of a particle Reynolds number and a ity profile steepness parameter. These neters were shown to be in fixed relation to other because of the nature of the bounded flow near a streambed. The relation between two parameters and the correlation of the coefficient with the relation between them lemonstrated in experiments. (See also W77-) (Sims-ISWS)

In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-26 - 4-36, 1976. 5 fig, 4 ref.

Descriptors: *Scour, *Deposition(Sediments), *Model studies, Degradation(Stream), Aggradation, Sediment transport, Sediments, Streams, Rivers, Floodways, Levees, Mathematical models, Computer models, Channel morphology, Erosion, Sedimentation, Sedimentology, *Louisiana.
Identifiers: *Atchafalaya Floodway(La).

The analysis of scour and deposition by modeling the interaction between the water-sediment mixture, sediment material forming the stream's boundary, and the hydraulic characteristics of flow was presented using the Hydrologic Engineering Center's computer program entitled 'Scour and Deposition in Rivers and Reservoirs.' This simulation program was particularly useful for analyzing the impact of changes in energy gradient, channel width, inflowing sediment load, or bed material grain size on future trends in channel aggradation or degradation. The results of the analysis were useful for estimating the impact of aggradation on the design profile for levees and the amount, frequency, and location of maintenance dredging, as well as the effect of alternative measures, for maintaining a channel. Example applications illustrated the model calibration and demonstrated its applicability and usefulness for a wide range of hydraulic and sediment conditions. (See also W77-00775) (Sims-ISWS)

LAKE POWELL SEDIMENTATION SURVEYS,
Bureau of Reclamation, Salt Lake City, Utah. Div. of Planning.
J. F. Lazenby, and L. Nelson.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-52 - 4-63, 1976. 5 fig, 2 ref.

Descriptors: *Sedimentation, *Reservoirs, *Surveys, *Colorado River, Sedimentation rates, Deposition(Sediments), Reservoir silting, Sediments, Sediment distribution, Lakes, Dams, Rivers, Geomorphology, Deltas, Sedimentology.
Identifiers: *Lake Powell(Ariz-Utah), *Glen Canyon Dam.

Glen Canyon Dam, major unit of the Colorado River Storage Project, is located on the Colorado River near the Arizona-Utah border. Storage in the 27,000,000 acre-foot reservoir began in 1963. Preconstruction studies indicated that sediment would accumulate at an average rate of 85,400 acre-feet per year over a 100 year period. In 1968, 1970, and 1973 the Bureau of Reclamation conducted limited, reconnaissance grade surveys in the delta areas of the reservoir in order to monitor the sediment build-up and its relationship to recreational uses on the lake. Deltas in the two major tributary arms of the reservoir were found to be developing approximately as expected, with their configuration, at this early stage in the reservoir's life, strongly influenced by the original channel topography and the rising water surface. Relatively large delta build-ups have been noted in some of the smaller tributary canyons. Experience and data gained during these limited surveys will be put to use in laying out a monumented sediment range network when the time comes for the first complete volumetric survey of the reservoir. Baseline data for the volumetric survey will come from existing large scale, small contour interval topographic maps of the reservoir basin. (See also W77-00775) (Sims-ISWS)

In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-76 - 4-87, 1976. 4 fig, 5 tab, 2 ref.

Descriptors: *Sediment transport, *Colorado River, *Beaches, *Sand bars, Sediment load, Particle size, Degradation, Erosion, Deposition(Sediments), Sands, Beach erosion, Eddies, Banks, Bank erosion, Sediments, Sedimentation, Sedimentology, Arizona.
Identifiers: *Grand Canyon, *Glen Canyon Dam.

With the closure of the Colorado River by Glen Canyon Dam, both the amount and the nature of the sediment movement through the Grand Canyon have changed. At present, the mean annual capacity of the river to carry beach-building material is about 12 million metric tons per year. The tributaries supply about 2.7 metric tons of beach-building sediment per year. The difference of about 9 million metric tons per year must be obtained through scour of bed and/or banks. It is estimated that without remedial measures it may take somewhat more than 200 years before the beaches and sand bars between Glen Canyon Dam and Lake Mead disappear. THE SEDIMENTARY INFLUENCE OF A TRIBUTARY STREAM GROWTH OF THE NIOBRARA DELTA,
Army Engineer District, Omaha, Nebr.
R. H. Livesey.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-127 - 4-137, 1976. 5 fig, 5 tab.

Descriptors: *Deltas, *Sedimentation, *Rivers, *Missouri River, Deposition(Sediments), Channels, Channel morphology, Braiding, Flow, Streamflow, Flow control, Sand bars, Sediment yield, Sediment load, Sediment discharge, Sedimentology.
Identifiers: *Niobrara River(Neb).

There is evidence that a dynamic balance has been achieved between the sediment transport capabilities of two alluvial streams when graded conditions develop at their confluence. This quasi-equilibrium state implies a dual adjustability in the channel dimensions or slope of both streams as the individual hydrologic trends of the separate drainages vary discharges and sediment loads. When a sudden reduction in the frequency, magnitude, and duration of flows on the main stem occurs due to upstream regulation, this balance is interrupted and the tributary sediment contribution assumes controlling proportions. Such was the case at the mouth of the Niobrary River after the

Missouri River reservoir system commenced operation in 1953. This paper discussed the growth of the Niobrara delta in the Missouri River channel over a 20-year period. Preliminary results of study investigations were summarized and prevailing trends identified. (See also W77-00775) (Sims-ISWS)
W77-00824

DISTRIBUTION OF RESERVOIR SEDIMENT--IOWA AND MISSOURI DEEP LOESS HILLS,
Agricultural Research Service, Columbia, Mo. North Central Watershed Research Center.
H. G. Heinemann, and D. L. Rausch.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-138 - 4-148, 1976. 2 fig, 1 tab, 12 ref.

Descriptors: *Sediment distribution, *Reservoirs, *Iowa, *Missouri, Sedimentation, Storage capacity, Depth, Precipitation(Atmospheric), Runoff, Erosion, Equations, Spillways, Sediments, Loess, Soil erosion, Regression analysis, Sedimentology.

Sedimentation data from 58 surveys of 41 reservoirs were analyzed to determine sediment distribution of deposited sediment. All reservoirs, except two, were located in the Iowa and Missouri Deep Loess Hills Major Land Resource Area. The sedimentation information curves approach was used in this study. Linear and nonlinear regression analyses were used to develop prediction equations for various values of the capacity replaced by sediment curve. It was learned that the minimum design spillway elevation can be predicted if the following are known: (1) total capacity to be replaced by sediment at the end of the reservoir design life, (2) reservoir original 'N' value, (3) length, and (4) original depth. The percentage of the remaining capacity that lies below the principal spillway is dependent upon: (1) the remaining depth ratio, (2) the original 'N' value, and (3) the percentage of the total original capacity that was below the principal spillway. By having the capacity replaced by sediment curve and the original stage-capacity curve, points can be computed for drawing the sediment distribution curve. The capacity replaced by sediment curve and its corresponding sediment distribution curve can be predicted for any estimated reservoir storage depletion in the Iowa and Missouri Deep Loess Hills. SCOUR AND FILL IN AN EPHEMERAL STREAM,
California Inst. of Tech., Pasadena. Div. of Geological and Planetary Sciences.
M. G. Foley.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 5-1 - 5-12, 1976. 6 fig, 1 tab, 17 ref. NSF GK 31802, Army DAHC04-74-G-0189.

Descriptors: *Scour, *Landfills, *Deposition(Sediments), *Ephemeral streams, Erosion, Sedimentation, Degradation(Stream), Aggradation, Beds, River beds, On-site investigations, Runoff, Floods, Equations, Flow, Streamflow, Sedimentology.

The classical concept that mean bed elevation over an entire stream reach is lowered by scour during flood-wave passage and is restored by deposition in the waning flood phase (mean-bed scour and fill) can be challenged. The alternative that both scour and fill occur simultaneously at different migrating loci within a reach (local scour and fill) is more consistent with published field data. The field investigation reported herein suggested that mean-bed scour and fill in a natural uniform channel is minor compared to local scour and fill caused by bedform migration. This experiment, utilizing a rectilinear array of buried maximum-scour indicators (scour-cords), produced data for contouring of maximum scour and fill in an ephemeral streambed during two floods. In the first flood, 24 cm (9.5 in) of scour and fill were measured for a bankfull flow depth of 23 cm (9 in). In the second flood, maximum scour and fill were at least 66 cm (26 in) for a bankfull flow depth of 34 cm (13 in). Estimates of antidune amplitudes for the two floods, based on theoretical models and laboratory and field observations, were 28 to 64 cm (11 to 25 in) and 48 to 97 cm (19 to 38 in), respectively. This suggests that all scour and fill measured by the scour-cord array was caused by antidune migration. (See also W77-00775) (Sims-ISWS)

APPLICABILITY OF THE UNIT STREAM POWER EQUATION,
Army Engineer District, Chicago, Ill.
C. T. Yang, and J. B. Stall.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 5-37 - 5-47, 1976. 8 fig, 12 ref. OWRT B-075 - ILL(4). 14-31-0001-3881.

Descriptors: *Sediment transport, *Yield equations, *Sediment discharge, Rivers, Equations, Estimating equations, Sediments, Sediment yield, Flow, Streamflow, Velocity, On-site investigations, Suspended solids, Beds, Streambeds.
Identifiers: Unit stream power equation.

The usefulness of a sediment transport equation to engineering depends on its applicability to natural rivers. Data collected from six river stations were used to compare the applicability of different equations. The comparisons indicated that the dimensionless unit stream power equation is the one which can provide accurate predictions of total sediment discharge in natural rivers under diversified flow and sediment conditions. The limitations to which this dimensionless unit stream power equation can be applied were explained. (See also W77-00775) (Sims-ISWS)

ENTRENCHMENT OF DRAINAGE SYSTEMS IN WESTERN IOWA AND NORTHWESTERN MISSOURI,
Agricultural Research Service, Columbia, Mo.
R. F. Piest, C. E. Beer, and R. G. Spomer.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 5-48 - 5-60, 1976. 7 fig, 1 tab, 12 ref.

Descriptors: *Erosion, *Drainage system *Agricultural runoff, *Iowa, *Missouri, Gullie Gully erosion, Channel morphology, Sedime yield, Channel erosion, Degradation(Stream), Er sion control, Crops, Soil erosion, Sheet erosio Rill erosion, Sedimentation.
Identifiers: *Drainageway erosion.

During the past few decades, drainageway erosi in the loess hills region of Iowa and Missouri h accelerated, and there is little deterrent to co tinued erosion on a massive scale. It is comple linked to the general runoff regimen and changes in soil water content. Overland runo volumes due to intensive cultivation are 2 to times presettlement volumes, and peak flow ra average more than 10 times the presettleme norm that existed before 1850. The erosi problem was assessed from random channel me surements in three counties of the study regi from intensive measurements of sheet-rill a gully erosion rates on experimental watershe near Treynor, Iowa, and from existing sedime yield records. Although measures of sedime yields at downstream locations usually were l than 12 or 13 metric t/ha (5 or 6 t/a) per year, t total upland erosion (sometimes called gross e sion) was significantly greater. Intermediate-s channels draining areas of more than 2.6 sq km sq mi) were degrading rapidly, with average los of 4.5 metric t/ha (2 t/a) sediment annually; gu erosion rates for smaller drainage basins averag at least 4.5 metric t/ha (2 t/a) each year; and t soil losses from sheet-rill erosion on fiel averaged at least 18 metric t/ha (8 t/a) annual (See also W77-00775) (Sims-ISWS)

CHANNEL CHANGES IN THE COLORAD RIVER BELOW GLEN CANYON DAM,
Bureau of Reclamation, Denver, Colo. Engine ing and Research Center.
E. L. Pemberton.
In: Proceedings of the Third Federal Inter-Agen Sedimentation Conference, 1976; Denv Colorado, March 22-25, 1976. Water Resourc Council, Washington, D.C., Sedimentation Co mittee, p 5-61 - 5-73, 1976. 11 fig, 1 tab, 5 ref.

Descriptors: *Channel morphology, *Erosio *Degradation(Stream), *Colorado River, Sa pling, Surveys, On-site investigations, Partic size, Sands, Gravels, Rocks, Sediments, Bott sediments, Channel erosion, Streamflow, Dams.
Identifiers: *Glen Canyon Dam, *Paria River, A moring, Armoring layers.

Construction of Glen Canyon Dam on t Colorado River by the Bureau of Reclamati started in 1956, and the dam was officially clos in March 1963. The 1957 degradation study, bas on a detailed bottom sediment sampling progr in 1956 and an analytical approach to sedime transport and armor, resulted in a prediction about a 1.22-meter (4-foot) degradation immedia ly below the dam and 8.26 million cubic met (6,700 acre-feet) of erosion to take place in t reach above the mouth of the Paria River in abo 14 years. To verify changes since closure of t dam, resurveys of cross sections in the appro mate 24-kilometer (15-mile) reach of the Colora River from Glen Canyon Dam to the mouth of t Paria River near Lees Ferry were made in 19 1963, 1965, and 1975. Bottom sediment samp were also collected in 1966 and 1975 to analyze t changes in material size as a result of the degra tion and armoring process. The resurveys co firmed the 1957 predictive study by noting th sufficient armoring material remained to cont excessive degradation with about 9.87 milli cubic meters (8,000 acre-feet) of material scour from the channel bottom by 1975. This paper su marized the 1957 predictive study of probab degradation and described the changes that ha taken place in the channel from 1956 to 1975. (S also W77-00775) (Sims-ISWS)

ANNEL CHANGES PRODUCED BY THE 3 FLOOD ON THE LOWER MISSISSIPPI VER,
ny Engineer District, Vicksburg, Miss. amology Section.
H. Walters.
Proceedings of the Third Federal Inter-Agency limentation Conference, 1976; Denver, lorado, March 22-25, 1976. Water Resources ncil, Washington, D.C., Sedimentation Com-tee, p 5-74 - 5-85, 1976. 11 fig.

scriptors: *Channel morphology, *Erosion, dimentation, *Mississippi River, Deposi-n(Sediments), Floods, Turbulence, Flow, Sedi-nts, Sands, Gravels, Sand bars, Aerial photog-hy, On-site investigations, Flow charac-stics, Flow profiles, Velocity, Islands, Dikes, ers.

e 1973 flood on the Lower Mississippi River of-ed a unique opportunity to observe the effects a major flood on the morphology of the channel. imited number of segments or reaches of river s chosen for a study of changes based on availa-ty of previous hydrographic surveys and flood color infrared photography. The Togo nd Bend to Middleground Island Reach was ected for discussion in this paper. Water sur-e flow patterns were identified using color in-red photography and surface float measure-nts in conjunction with hydrographic surveys. ld trips taken during the following low water son revealed definite changes in the shape and al extent of both sand bars and islands. In most es, the islands were larger and had increased in vation to near the top bank height of the main nnel. Gravel deposits were present to a greater ent than in previous years. The gravel sizes ob-ved were much larger than could be sampled h the sediment sampling equipment now used. e effects of the 1973 flood clearly indicated that ge floods accelerate changes in channel shape l alter the characteristics of the alluvial osits. DEL STUDY OF RIVERBED MATERIAL IN NYON FERRY DAM SPILLWAY STILLING SIN,
reau of Reclamation, Denver, Colo. Engineer-and Research Center.
H. Burgi.
Proceedings of the Third Federal Inter-Agency limentation Conference, 1976; Denver, orado, March 22-25, 1976. Water Resources ncil, Washington, D.C., Sedimentation Com-tee, p 5-86 - 5-99, 1976. 5 fig, 1 tab.

scriptors: *Dams, *Settling basins, eposition(Sediments), *Model studies, Hydrau-models, Spillways, Stream stabilization, ers, River beds, Reservoir releases, Reservoir ration, Sediments, Erosion, Sedimentology.
ntifiers: *Canyon Ferry Dam(Mont).

draulic model studies were made to determine cause and recommend a solution for the osit and movement of riverbed material into Canyon Ferry Dam spillway stilling basin. ts indicated that movement of riverbed materi-esults from operation of the river outlet works ischarges greater than 3,000 cu ft/s (85 cu m/s). eral solutions to the problem were suggested, uding a limitation on operation of the river out-to 3,000 cu ft/s (85 cu m/s). Studies were con-ted to determine the effectiveness of the spill-discharge in clearing various amounts of osited material from the basin. As a result of se studies, a recommended spillway discharge applied to the Canyon Ferry stilling basin to n 900 cu yd (688 cu m) of riverbed material n the basin. Soundings of the basin were taken ediately after the suggested release and con-ed the model results. (See also W77-00775) ns-ISWS)

PATTERNS OF SCOUR AND FILL IN POOL-RAPID RIVERS,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
E. Silverston, and E. M. Laursen.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 5-125 - 5-136, 1976. 9 fig, 2 ref.

Descriptors: *Rivers, *Scour, *Deposition(Sediments), *Model studies, Mathematical models, Erosion, Sedimentation, Weirs, Control, Flow, Streamflow, Sediment transport, Hydraulics.
Identifiers: *Pool-rapid rivers.

The characteristics of the imaginary pool-rapid river studied in this investigation were completely arbitrary--but not unlike the Colorado River. It was concluded that the seemingly erratic behavior of pool-rapid rivers is subject to rational explanation: Because the change in head on a critical control (rapid or weir) is less than the change in equilibrium depth in the pool upstream, a pool will eventually scour with an increase in flow and fill with a decrease in flow. However, because the supply of sediment to a pool is dependent on the conditions at the outlet of the pool just upstream, initially there may be either scour or fill in the downstream pool with an increase in flow. Indeed, a pool following several other pools may behave in a seemingly erratic manner because its sediment supply is affected by what happens in each of the upstream pools. SEDIMENT DISPERSAL IN WESTERN LAKE MICHIGAN NEAR TWO CREEKS, WISCONSIN, AND THE INFLUENCE OF AN INDUSTRIAL COOLING WATER DISCHARGE,
Wisconsin Univ., Madison. Sea Grant Program; and Wisconsin Univ., Madison. Geo-Environmental and Mineral Resources Program.
M. H. Kohler, and J. R. Moore.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 6-39 - 6-50, 1976. 7 fig, 5 ref.

Descriptors: *Sediments, *Lake Michigan, *Wisconsin, *Sediment transport, *Powerplants, Nuclear powerplants, Cooling water, Discharge(Water), Littoral drift, Sands. Gravels, Clays, Shores, Lakes, Erosion, Sedimentation, Sedimentology, Limnology, Thermal pollution, Path of pollutants.
Identifiers: *Two Creeks(Wis), *Two Rivers(Wis).

The sedimentary regime in Lake Michigan between Two Rivers and Two Creeks, Wisconsin was investigated during four field seasons, 1971-1974. The area was selected because a shoreline industrial cooling water discharge became operational in 1971. Sediment transport patterns, including natural short-term variabilities, were defined. Alterations in the near-shore deposition patterns were noted near the cooling water discharge. The following conditions were found to exist: the offshore sedimentary regime was composed of four types of sediment. Desiccated red clay of Valderan age (Pleistocene) was exposed, with little or no overlying recent sediment, primarily in nearshore waters in the northern half of the study area. Rocky gravels and gravelly sand predominantly occupied a lobate zone in the intermediate depths in the northern sector. Sand, mainly in the fine sand class, dominated the southern portion of the area, from the shoreline to depths exceeding 30 m (100 ft) and extended northward in a band east of the rocky gravels and gravelly sands. Muddy sands were found beneath the deepest waters and in intermittent patches elsewhere. As indicated by the increase in sorting and decrease in grain size, the net transport of sediments offshore was north to south through the study area. Along the shoreline, the transport direction periodically reversed, but the net transport was from north to south. Pleistocene drift deposits formed bluffs at the back-beach north of Two Creeks and acted as a source for the modern sediments. (See also W77-00775) (Sims-ISWS)

COASTAL EROSION IN EASTERN LAKE MICHIGAN,
University of South Florida, Tampa. Dept. of Geology.
R. J. Davis Jr.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 6-51 - 6-61, 1976. 5 fig, 1 tab, 10 ref. Army DACW 72-70-0037, Army DACW 72-73-C-0003.

Descriptors: *Lake Michigan, *Beach erosion, *Shores, Erosion, Storms, Waves(Water), Winds, Lakes, Water levels, Geology, Geomorphology, Beaches, Weather data, Meteorological data, Sediments, Sedimentation

Rapid and extensive erosion has taken place throughout the eastern coast of Lake Michigan during the past several years (1968-73). The result has been millions of dollars of property loss and damage. Detailed monitoring of 17 beach profiles along nearly 200 miles of the Lake Michigan coast has provided substantial insight into the nature of the erosion and its probable causes: Rapidly rising lake level caused the beach and adjacent dunes or bluffs to be vulnerable to wave attack. Erosion was quite localized during the first two years of the study and did not become universal until the final year (1972-73). During most times, local factors predominated in controlling erosion and/or accretion on the coast. Longshore sand bars, coastal composition, and shoreline configuration were most significant. Erosion was common during the intense storms of late fall just prior to the formation of coastal ice and to a lesser extent just

after ice melting in early spring. Single storms seemed to cause the bulk of the annual erosion at a given site. Rapid recovery of the beach seemed to take place between individual storms, however, during later fall, their frequency was such that recovery was not possible. (See also W77-00775) (Sims-ISWS)

A TIME RELATED AUTOMATIC TOTAL-LOAD SEDIMENT SAMPLER,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
K. G. Renard, J. R. Simanton, and L. D. Donica.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 7-17 - 7-29, 1976. 9 fig, 1 tab, 6 ref.

Descriptors: *Instrumentation, *Sediments, *Sampling, Runoff, Equipment, Potentiometers, Sedimentation, Erosion, Water sampling, Electronic equipment, Electrical equipment, Watersheds(Basins), Sedimentology.
Identifiers: *Sediment samplers.

A total-load, automatic, sediment sampler was developed and tested for use with small runoff measuring flumes. The system collected individual, total-load, sediment samples which provided periodic sediment concentration data during a runoff event. The system consisted of two parts, the sampler and the collector. The sampler was a vertical slot that traversed on a horizontal rail through the flow at the flume's exit. The traverse speed was regulated by flow depth and aliquot size. The collector was a revolving table with a capacity of 18 2-liter (about 0.5 gal) bottles. Table rotation was regulated by a timer and a new bottle was filled with each traverse. The time of each traverse was recorded on the stage record. The system was powered by a 12-volt, DC battery charged by a solar generator, which allowed using the system in remote areas where conventional electrical power was not available. THE USE OF COLOR INFRARED PHOTOGRAPHY FOR THE DETERMINATION OF SUSPENDED SEDIMENT CONCENTRATIONS AND SOURCE AREAS,
Forest Service (USDA), Fort Collins, Colo. Arapaho-Roosevelt National Forest.
D. L. Rosgen.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 7-30 - 7-42, 1976. 11 fig, 1 tab, 16 ref.

Descriptors: *Remote sensing, *Aerial photography, *Suspended solids, *Turbidity, Streams, Watersheds(Basins), Mountains, Snowmelt, Runoff, On-site investigations, Sampling, Erosion, Channel erosion, Photography, Infrared radiation, Sediments, Sediment discharge, Data processing, Analytical techniques.

The concepts and special techniques for applying color infrared photography in sediment studies were presented. These techniques were developed and evaluated through a low elevation color infrared photography flight and concurrent water quality sampling conducted on 164 km (100 miles) of stream over the West Fork of the Madison River in southwestern Montana. The concentrations and sources of sediment produced during peak snowmelt runoff were determined by photo densitometric analysis coupled with specifically located ground control stations. Excell correlations were established by regression analysis of the ground truth variables including stream width to discharge and suspended sediment to turbidity. Photo density was correlated with suspended sediment and turbidity. Both produced strong correlations which were significant at the 99% confidence level. These correlations made it possible to determine reliable estimates of sediment concentrations from the aerial photography where stream measurements were not obtained. The photographic analysis indicated that the majority of the suspended sediment sources during the snowmelt runoff event were derived primarily from channel erosion. Additional interpretations which can be derived from photo analysis were also presented and discussed. (See also W77-00775) (Sims-ISWS)

GAGING SEDIMENT-LADEN FLOWS WITH V-NOTCH WEIRS,
Agricultural Research Service, Columbia, Mo. North Central Watershed Research.
K. E. Saxton, and J. F. Ruff.
In: Proceeding of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 7-43 - 7-53, 1976. 4 fig, 1 tab, 9 ref. ARS 12-14-3001-223.

Descriptors: *Weirs, *Gaging stations, *Stream gages, *Streamflow, Flow, Runoff, Measurement, Suspended solids, Deposition(Sediments), Discharge(Water), Hydraulic structures, Calibrations, Model studies, Hydraulic models, Alluvial channels.
Identifiers: Broad-crested weirs, V-notch weirs, Weir calibrations.

Watersheds with areas of less than 1 sq mi (2.59 sq km) often have streamflow with stages that rise and fall rapidly. These rapid stage changes prevent accurate field calibration of streamflow gaging stations by usual techniques; therefore, a reliable, precalibrated measuring device is necessary. Also, the streamflow from these small watersheds is often heavily laden with sediment (up to 200,000 ppm), and the alluvial stream channels change their cross section and slope upstream of the measuring device. These sloping and aggrading approach channels can change the stream gage calibration. Broad-crested, V-notch weirs, developed by the U. S. Soil Conservation Service, have been used extensively. Recent evidence has shown that different approach channel slopes and shapes and sediment deposits cause significant deviations from the original calibrations. Model studies were conducted to define the effect of approach channel geometry and sediment deposits on the weir calibrations. A rigid-boundary model was used for the tests. Channel slopes were 0.0, 0.5, 1.0, 1.5, and 2.0% for several approach channel cross sections. The results provided improved calibrations for broad-crested, V-notch weirs for gaging sites in alluvial channels. (See also W77-00775) (Sims-ISWS)

ntifiers: Calcium carbonate precipitation, Sub- cial limestone, Glacial geology, Glacial sliding, ezing calcium carbonate solutions.

nestone and other calcareous outcrops recently osed by retreating temperate glaciers in the cky Mountains are widely covered with patchy bonate coatings that formed as a result of mical precipitation under the moving ice. They m because CaC03 dissolved from the bedrock the stoss sides of bed obstacles is concentrated he lee sides by the freezing of the meltwater in regelation-slip process, which is an essential t of the mechanism by which temperate glaciers le over their beds. Freezing experiments wed that ice grown from CaC03 solutions at es similar to those expected in connection with elation sliding had calcium ion concentrations to 100 times smaller than the solutions; hence freezing process strongly concentrated solutes the melt. The experimental results were in- preted in terms of the pertinent phase relations, ich were derived numerically on the basis of the st recent solubility data for calcite and an esti- te of the freezing point lowering due to the sence of solutes. It was concluded that the sub- cial chemical deposits indicate clearly that mical exchange is active under temperate ciers and that glacio-chemical processes do at es play a dominant role in modifying the glacial l. Moreover, they are of particular interest cause the chemical and physical processes by ich they form may affect the behavior of entire cial masses by impeding basal sliding. (Sims- WS)

Descriptors: *Littoral, *Bays, Aquatic animals, Aquatic plants, Sediments, Coasts.
Identifiers: *Epibiotic fauna, Mukkan Coasts(India), *Bay of Bengal(India), *Epibiotic flora.

The serpulid zone of the Mukkan coast (India) 40 km N of Visakhapatnam (Bay of Bengal) was investigated qualitatively and quantitatively for faunal associations. A total of 67 spp. belonging to 18 animal groups are given. An average density of 30.82 organisms/cm3 was found. The importance of sessile animal growths as a littoral habitat is emphasized. The morphology of the substratum, wave action and sediment accumulation are the factors controlling animal diversity. Possible factors for the coexistence of the littoral animals are indicated.—Copyright 1976, Biological Abstracts, Inc.

FORCES ON A ROUGH BED IN OSCILLATORY FLOW,
Cambridge Univ. (England). Dept. of Engineering.
J. F. A. Sleath.
Journal of Hydraulic Research, Vol. 14, No. 2, p 155-164, 1976. 8 fig, 14 ref.

Descriptors: *Ocean waves, *Drag, *Laminar flow, *Hydraulics, *Numerical analysis, Reynolds number, Roughness(Hydraulic), Analytical techniques, Boundary layers, Sediment transport.
Identifiers: *Lift force, *Oscillatory flow, Wave period.

Results are presented of numerical and analytical solutions for the drag and lift forces exerted in laminar flow on a two-dimensionally rough bed by wave action: Bottom friction causes attenuation of the waves as they approach the coast, and the longshore current is affected by bed friction as well as the sediment transport. Only two-dimensional bed roughness is considered when bed roughness length is large compared with the boundary layer thickness. When bed roughness size is small compared with the thickness of the viscous boundary layer, the lift force is negligible compared with the drag. The component of drag due to shear stress is much larger than the resolved component of pressure on the bed. For particles whose size is large compared with the thickness of the viscous boundary layer, the aforementioned conclusions do not apply. For moderate to high values of the ratio of amplitude of the horizontal component of velocity outside the boundary layer to kinematic viscosity divided by the wave period, the lift may completely dominate the initial motion of the sediment. FINESTRUCTURE AND MICROSTRUCTURE OBSERVATIONS DURING THE PASSAGE OF A MILD STORM,
Washington Univ., Seattle. Dept. of Oceanography; and Washington Univ., Seattle. Applied Physics Lab.
M. C. Gregg.
Journal of Physical Oceanography, Vol. 6, No. 4, p 528-555, July 1976. 20 fig, 6 tab, 25 ref. ONR N00014-69-A-0200-6049.

Descriptors: *Oceans, *Storms, *On-site investigations, *Pacific Ocean, *Temperature, Winter, Water temperature, *Salinity, Density, Fluctuations, Air-water interfaces, Heat transfer, Winds, Equations, Mixing, Data processing, Meteorology, Oceanography.
Identifiers: Finestructure, Microstructure.

Finestructure and microstructure observations of temperature and salinity were made over a two-week period in late winter at a site in the central North Pacific, during which time a mild storm, maximum winds of 18 kt, passed through the area. The strong initial lateral variability in T and S, but weak vertical stratification, was altered, apparently by mixing due to surface cooling and the storm winds to produce several discrete types of water. These discrete types of water began to spread laterally several days after the onset of the storm and resulted in a triple step structure of 50 m thick homogeneous layers at one location. The 2.5 m thick transition region at the base had a sharp interface, 0.25 m thick, but there was no evidence of entrainment. A few days later a mixed layer half as thick, apparently resulting from the intrusion of denser water beneath, showed a transition with numerous small-scale instabilities and an overturn on a 0.12 m thick interface directly below the mixed layer. In the stratified water below the surface layers, the levels of microstructure detected during the storm appeared little different from those found afterward. (Sims-ISWS)

A CYCLESONDE VIEW OF COASTAL UPWELLING,
Rosenstiel School of Marine and Atmospheric Science. Miami, Fla.
W. R. Johnson, J. C. Van Leer, and C. N. K. Mooers.
Journal of Physical Oceanography, Vol. 6, No. 4, p 556-574, July 1976. 18 fig, 26 ref, 1 append. NSF IDOE GX-33052, NSF DES72-0147 A03.

Descriptors: *Upwelling, *Pacific Ocean, *Oregon, *On-site investigations, Continental shelf, Continental slope, Instrumentation, Circulation, Flow, Water circulation, Ocean circulation, Velocity, Temperature, Water temperature, Density, Data processing, Oceanography.

In August 1973, 320 vertical profiles of temperature and horizontal velocity were recorded during a 64 h period by an array of three Cyclesondes in the coastal upwelling region off Oregon. The mean interior alongshore velocity was geostrophic and a linear function of density, with a near-surface, equatorward jet at mid-shelf, and a poleward undercurrent at the shelf break. The mean cross-shelf flow was relatively weak and substantially

ageostrophic; it was suggestive of a two-cell (co-rotating) circulation within the mid-shelf frontal zone and a two-cell (counter-rotating) circulation near the shelf break. The direction of the mean, near-bottom, cross-shelf flow was consistent with a bottom Ekman layer driven by the mean near-bottom alongshore flow. At mid-shelf, near-inertial motions with a vertical wavelength of 50 m, upward phase velocity, and downward group velocity persisted throughout the record. The hourly vector shears indicated a layer of persistent shear instability at the base of the upwarped permanent pycnocline at mid-shelf. There the near-inertial shear was twice as great as the mean shear; therefore, it may have played a dominant role in mixing processes. It was concluded that in coastal upwelling regions, a vertical resolution of 10-20% of the water depth and a temporal resolution of 10-20% of an inertial period are probably necessary and sufficient to produce coherent fields of the slowly varying horizontal velocity. ON A MID-OCEAN THERMOCLINE REGIME,
Washington Univ., Seattle. Dept. of Oceanography.
P. Welander, and C-T. Liu.
Journal of Physical Oceanography, Vol. 6, No. 4, p 592-595, July 1976. 6 fig, 5 ref. NSF DES74-13339.

Descriptors: *Thermocline, *Oceans, *Water temperature, Winds, Temperature, Model studies, Mathematical models, Circulation, Equations, Ocean circulation, Heat transfer, Boundaries(Surfaces), Physical properties, Thermal properties, Oceanography.

In a uniform-depth ocean forced by a wind stress and surface heat flux (or surface temperature) which are independent of longitude, there exists a possible thermocline regime with vanishing east-west temperature gradient. The associated meridional-vertical circulation is entirely wind-driven, producing a deep thermal structure at high latitudes, a thin equatorial thermocline, and a vertical thermal front at the latitude of vanishing Ekman downwelling. Some numerical examples were given. (Sims-ISWS)

THE FORMATION OF THE YUCATAN CURRENT BASED ON OBSERVATIONS OF SUMMER 1971,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
R. L. Molinari.
Journal of Physical Oceanography, Vol. 6, No. 4, p 596-602, July 1976. 5 fig, 1 tab, 4 ref. NSF AG-253.

Descriptors: *Currents(Water), *Ocean currents, *Thermal properties, Temperature, Salinity, Buoys, Coriolis force, Circulation, Ocean circulation, Water circulation, Oceanography.
Identifiers: *Yucatan current, *Caribbean Sea, *Gulf Stream, Drifter data.

Temperature, salinity, and Lagrangian current data collected during the summer of 1971 in the western Caribbean Sea were employed to evaluate the ageostrophic components of the flow in the formation region of the Yucatan Current. The ratio of tangential and centripetal accelerations to Coriolis acceleration for data averaged over 24 h periods remained less than 10% except in two areas. An anticyclonic turn, centered at 19 deg 30 min N, 86 deg W, had the largest centripetal accelerations, and in the region of Cozumel Island significant tangential accelerations occurred. The large-scale accelerations and additional evidence supported the hypothesis that inertial effects dominate in the formation of the Yucatan Current. (Sims-ISWS)
W77-00657

TIDAL PRISM - INLET AREA RELATIONSHIPS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. T. Jarrett.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-022 327, Price codes: A03 in paper copy, A01 in microfiche. GITI Report 3, February 1976. 55 p, 19 fig, 4 tab, 20 ref, append.

Descriptors: *Inlets(Waterways), *Tides, *Jetties, Channels, Bays, Estuaries, Flow, Tidal bores, Harbors, Waves(Water), Coasts, Shores, Oceanography.
Identifiers: *Tidal prisms.

The tidal prism-inlet area relationships for inlets on sandy coast established by M. P. O'Brien (See 74-03695) were reanalyzed using his data and data published by other investigators. In addition, tidal prism and inlet cross-sectional area data developed in the Inlet Classification Study, a subfeature of the Corps of Engineers General Investigation of Tidal Inlets, were also used. These data resulted in a total of 162 data points for 108 inlets--59 of which were located on the Atlantic coast, 24 on the Gulf coast, and 25 on the Pacific coast of the United States. The data were grouped into three main categories, namely: (1) all inlets, (2) unjettied and single-jettied inlets, and (3) inlets with two jetties. Within each of these three categories, the data were further subdivided into: (1) inlets on all three coasts, (2) inlets on the Atlantic coast, (3) inlets on the Gulf coast, and (4) inlets on the Pacific coast. Regression analysis was performed on each set of data to determine the equations of best fit and to establish 95% confidence limits for the equations and the constants in the equations. The results of the regression analysis, which in all cases yielded an equation of the form A = C(P to the nth power), in which C and n are constants determined by the regression analysis, indicated that the tidal prism-inlet area relationship is not a unique function for all inlets, but varies depending on inlet location and whether or not the inlet has been stabilized with a dual jetty system. Mud crabs.

Long-term observations on the natural seed oys
beds of Delaware Bay had shown that althou
supply of oyster larvae and setting potential
not differ over the area, survival of spat w
higher by a factor of 10 in fresher up-bay ar
compared with higher salinity beds dowb-bay, T
oyster drill, Urosalpinx cinerea Say, a comm
predator on higher salinity beds, accounted
some of the differential. The question was whet
other benthic species differences, controlled
salinity differences on the beds, were also imp
tant. To answer this question two beds, one ab
and one below the drill line, were compared
detail in spat survival. During this project the d
population on the lower bed was sharply reduc
probably resulting from an unusual pattern of ri
flows. Set on native shell compared with clean t
shells was reduced to 50% and 20% on the up
and lower bed respectively. Spat mortality in
first week after setting, averaging about 40%
both beds, was mostly due to predation by
large population of xanthid crabs (150-250 per M
Beyond the first week, mortality rates decli
more rapidly on the lower than on the upper bed
spat outgrew small predators. The resulting rev
sal in survival ratios on upper and lower be
coincident with reduced drill populations on
lower bed, implies strongly that in the past the d
has been largely responsible for the comparativ
poor survival of early set on the lower beds.

ntifiers: *San Francisco Bay-Delta Estuary, cramento River, *San Joaquin River.

liment transport in the San Francisco Bay-ta Estuary of California is being investigated an Interagency, Federal and State study group art of an overall investigation to assess the im-t of water resources development on the ecolo-of the Estuary. Transport characteristics of pended sediment in the upper San Francisco -Delta system east of San Pablo Bay were cussed. Analysis of the river discharge and pended solids data (1960-1969) indicated that r 88% of the sediment discharge by the rivers he Delta originates in the Sacramento River in. The analysis also indicated that during the vember through April period, 80% of the an-l sediment discharge from the rivers enters the ta. Suspended solids transport through the uary was primarily controlled by river inflow, ort pumping, tidal exchange, two-layered flow arine circulation, and surface wave action. A f summary of sediment discharge to the Bay-ta Estuary and a general description of the fac-influencing transport of sediments through the uary were presented. (See also W77-00775) ns-ISWS)

Proceedings of the Third Federal Inter-Agency imentation Conference, 1976; Denver, orado, March 22-25, 1976. Water Resources ncil, Washington, D.C., Sedimentation Com-ee, p 4-88 - 4-100, 1976. 4 fig, 3 tab, 15 ref.

criptors: *Sediment transport, *Sediments, ms, *Canals, California, Export, Sedimenta-, Aqueducts, Deposition(Sediments), Surveys, pling, Suspended solids, Sediment load, Sedi-t distribution, Sediment yield, Sediment con-Sediment rates, Sedimentology.
tifiers: *California Aqueduct, *Delta-Men-Canal(Calif), *Sacramento River, *San quin River.

The Delta-Mendota Canal (DMC), completed in 1951, has experienced capacity problems, currently attributed to a combination of design deficiency and the accumulation of sediment and clam deposits. The findings of studies conducted in 1973-74 on the sediment-clam deposition problem in the DMC were summarized and it was concluded that sediment in the water is bound by the excreta of the Asiatic clam (Corbicula manilensis). This accumulation of sediment-clam deposits causes a reduction in canal capacity, in addition to the design deficiency loss. Also, sediment transport characteristics of the DMC and the California Aqueduct were compared. Significant differences between the two intake facilities were indicated. Approximately 70% of the sediment entering the Aqueduct was deposited in Clifton Court Forebay and Bethany Reservoir, while only 10% was deposited in the DMC intake channel. The difference in sediment deposition was attributed to differences in design and operation of the intake facilities. The concentration of total suspended solids entering the DMC was found to vary directly with total delta export and vary inversely with the solids concentration of the Sacramento River, the primary source of delta export water. Identifiers: Oscillatory flow.

The results of research on initiation of motion and sediment transport in unsteady oscillatory flow from a research program underway at Massachusetts Institute of Technology were summarized. The results showed the Shields criterion for initiation of sediment motion in steady flow to hold also for unsteady, oscillatory flow when the Shields parameter was based on the maximum bottom shear stress. A quasi-steady application of the Einstein-Brown sediment transport relationship was shown to yield a fairly good representation of experimental data on sediment transport in oscillatory flow. The relationship was then modified for application to sediment transport by waves and currents. An example was given from a computer application for sediment transport in the vicinity of a semi-infinite breakwater subject to a spatially varying wave and current field, in which the maximum wave orbital velocity, u sub b = 1.15 m/sec (3.8 ft/sec), was considerably larger than the current velocity, U = 0.15 m/sec (0.5 ft/sec). The results were presented in a topographical map showing areas of scour and accretion of the order 2 cm/day (0.78 in) at a maximum. (See also W77-00775) (Sim-ISWS)

Descriptors: *Sediment transport, Ships, *Channels, *Water pollution, Numerical analysis, Computer programs, Inland waterways, Model studies.
Identifiers: *Waterways(Transportation), *Waterways(Watercourses), Momentum theory, Channel bottom, Ship's propellers.

A numerical model using the momentum theory of the propeller and Shields' diagram was developed to study sediment movement induced by a ship's propeller in a restricted waterway. The velocity distribution downstream of the propeller was simulated by the Gaussian normal distribution function. The shear velocity and shear stress were obtained using Sternberg's formulas. Once the ship's speed, depth of the waterway, RPM and diameter of the propeller, and draft of the ship are given, the velocity distribution and the grain size of the initial motion could be obtained from this model. A computer program was developed to solve it. Case studies are presented to show the influence of significant factors on sediment movement at the channel bottom induced by a ship's propeller. (NOAA)

Identifiers: Water motion, Salt wedge, Coastal marshes, *Tidal currents.

A review of knowledge of circulation and currents in the coastal water of Louisiana indicates that we lack a rudimentary knowledge of the mechanics of water motion along most of the coastline. Detailed salt balance and turbulent mixing studies should now be undertaken. Apparent ignorance prevails except for seasonal salinity patterns and the occasional isolated study. Detailed knowledge of the

dynamics of our prolific coastal bays and estuaries is embarrassingly poor. Existing numerical models of Barataria Bay and Chandeleur-Breton Sound may offer a shortcut to overcoming this disadvantage. Tidal passes, minor river mouths, and the circulation within the wetlands proper have been subject to sporadic, short-term measurement programs, but definitive studies of the flux of mass, heat, salt, and other important scalars have yet to be performed. A list of research priorities to eventually allow better utilization of our coastal waters is presented. (NOAA)

Identifiers: *Sanctuaries, Outer Continental Shelf, Coastal Zone Management, Ocean dumping.

This report has been prepared primarily with the intent of providing the participants in the Workshop on Sanctuaries with background information on the issue of marine and estuarine sanctuaries. It is also intended to present a series of concepts as to what might constitute marine or estuarine sanctuaries. A brief review is presented of legislative history, other programs, and various concepts as to what constitutes or should constitute marine and estuarine sanctuaries. Although one goal of the workshop is some consensus relative to sanctuaries, another goal is the clear exposition of partisan views in context with other either supporting or opposing views. Information is given on various governmental and private programs. Legitimate uses of the coastal zone are summarized. This workshop will provide the Department of Commerce with much of the information base needed for them to establish the policy of the Federal Government with regard to the sanctuary provisions of Public Law 92-532 and Public Law 92-583. A low cost system for automatically measuring and recording coastal wave data is being operated on a prototype basis. It utilizes standard dial up telephone lines to connect remotely located bottom mounted pressure sensors to a central station. The central station is run by a programmed minicomputer to automatically call each remote station in sequence, and take a continuous record of water pressure fluctuations versus time for approximately twenty minutes. These data are recorded on magnetic tape for processing by the same computer system. Periodically, data are processed and significant wave height, and energy versus period, computed. Currently four stations are being monitored over a thirty-seven mile length of Southern California coastline. Sites are located off the ends of established piers which provide suitable power, telephone connections, and bridge the surf zone. (NOAA)

ter Spectrum, Vol 5, No 3, p 19-26 (1973). 8 p, photo.

scriptors: *Chesapeake Bay, *Hydraulic dels, *Bodies of water, *Estuaries, *Model stu-s, Currents(Water), Fluid mechanics, Hydrau-engineering, Hydraulic similitude, Hydraulics, oratory tests, Testing, Hydraulic design, aryland, Federal government, Grants.

esapeake Bay is beginning to feel the effects of h human intrusion and natural forces. Spread-algae, wind and wave erosion, and pollution only a few of the problems that must be faced. order to meet these problems, Congress horized the construction of a hydraulic model Chesapeake Bay. Federal and State agencies university scientists are working on the nning and construction. When finished, it will the largest and most complete model ever built, ering nine and a half acres. It will accurately roduce the vertical and lateral distributions of rent velocity, salinity, and tidal elevation. A 12-r and 25-minute tidal cycle can be reproduced the model in about 7.5 minutes, and a one-year ing period can be reproduced in a little over e and a half days. The model is expected to e in advance problems of drilling, dredge a..d oil and waste pollution, saltwater en-achment, and waste heat. This hydraulic del, when used in conjunction with both lytical and field studies, will greatly assist er resource planners in developing responsible nagement programs for the Bay. (Frank-rida)

SEASONAL SHIFTS IN THE SPAWNING SITE OF A NORTHEAST PACIFIC INTERTIDAL FISH,
British Columbia Univ., Vancouver, B. C. Inst. of Animal Resource Ecology.
J. B. Marliave.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 10, October 1975, p 1687-1691, 3 fig, 1 tab, 7 ref.

Descriptors: Environmental effects, *Fish, *Spawning, Temperature, Seasonal, Waves(Water), On-site investigations, *Pacific Ocean, Intertidal areas.
Identifiers: *Black prickleback, Xiphister atropurpureus.

Spawning sites of the black prickleback, Xiphister atropurpureus, were studied. Shifts in spawning sites during the winter and spring spawning periods were observed. This species selects underboulder substrates of shells, pebbles, and small rocks that provide spaces most nearly matching the cross-sectional body size of the adults for spawning sites. Spawning occurs under such a wide range of water temperatures from December to May that slight temperature variations between sites could not solely account for differences. The seasonal shift probably results because wave action decreases as temperatures increase during the spring. (Chilton-ORNL)

SEASONAL DISTRIBUTIONS OF LARVAL FLATFISHES (PLEURONECTIFORMES) ON THE CONTINENTAL SHELF BETWEEN CAPE COD, MASSACHUSETTS, AND CAPE LOOKOUT, NORTH CAROLINA, 1965-66,
National Marine Fisheries Service, Highlands, N. J. Sandy Hook Lab.; and National Marine Fisheries Service, Highlands, N. J. Middle Atlantic Coastal Fisheries Center.
W. G. Smith, J. D. Sibunka, and A. Wells.
NOAA Technical Report NMFS SSRF-691, June 1975. 68 p, 72 fig, 16 tab, 44 ref.

Descriptors: *Reproduction, *Spawning, *Seasonal, *Distribution patterns, Fish, Larvae, Eggs, Temperature, On-site investigations, Continental shelf, Atlantic Ocean.
Identifiers: Bothids, Pleuronectids, Cynoglossids, *Flatfish.

In a survey designed to locate spawning grounds and trace dispersion of fish eggs and larvae on the continental shelf, 4 families, 17 genera, and 15 species of fish were studied. The usual time of spawning was in the spring during seasonal temperature changes. Bothids have longer spawning seasons than pleuronectids, beginning in spring and continuing through early fall, in the southern half of the study area. Pleuronectids spawned in the spring in the northern half of the survey area. Cynoglossids spawned incidentally off North Carolina but most of their larvae were transported into the study area from spawning grounds south of Cape Lookout. Onset of spawning was triggered by spring warming and fall cooling with most species spawning within a relatively narrow range of temperatures. (Chilton-ORNL)

ECONOMICS OF A FREEZE DESALTING PROCESS USING COLD SEAWATER EFFLUENT OF A LIQUID NATURAL GAS PLANT.
Fluor Engineers and Constructors, Inc., Los Angeles, Calif.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 272, Price codes: A04 in paper copy, A01 in microfiche. Office of Water Research and Technology, Final Report OWRT/S-76/52, March 1976. 46 p, 20 fig, 2 tab. 14-30-3313.

Descriptors: *Desalination, *Freezing, *Capital costs, Cost estimates, Sea water, *Desalination processes.
Identifiers: Secondary refrigerant, Liquid natural gas, Crystalex process, *Freeze desalting process.

Process flow diagrams of the AVCO 'Crystalex' freeze desalting process and of the modified processes when using cold seawater effluent from the liquid natural gas plant are presented. The lower feed temperature makes it possible to reject heat at a lower temperature and reduces refrigerant compressor work. Budget estimates indicate that the water costs could be reduced up to 18 percent for the AVCO process when cold seawater at 33 degrees F from the liquid natural gas plant is used. Detailed water and capital costs are presented. (OWRT)

3B. Water Yield Improvement

WATER RESOURCE AUGMENTATION IN THE SOUTHWEST.
In: Energy, Water, and the West, November 2-5, 1975, Albuquerque, p 47-52, May 1976. 5 append.

Descriptors: *Water resources development, *Southwest US, *Weather modification, *Snowpacks, Water sources, Water supply, Water importing, Land tenure, Legal aspects.
Identifiers: *Colorado River Basin Project Act, *Winter orographic snowpack augmentation.

Among the provisions of the Colorado River Basin Project Act passed by Congress in 1968 was one which forbade the Interior Secretary from studying or recommending water importation from areas of surplus without approval of the states involved. Although this moratorium ends in 1978, there won't be water available for exportation to the Southwest at that time. Most of the western states' watersheds are on federal land, and over two-thirds of the total land area of these states is federally owned. Legal conflicts are especially serious in the Northwest where water is more plentiful and the rights of use are in dispute. A study of winter orographic snowpack augmentation in the Upper Colorado River Basin is cited as a means of weather modification for water resource enhancement. This process involves increasing winter precipitation by seeding moisture-laden air masses pushed by prevailing winds over high mountain ranges, after which moisture is extracted by natural processes. The weather modification technique and its effects are described. Social impacts are discussed along with recommendations for the establishment of policies to govern weather modification and associated water resources development. WATER USE ON RANGELANDS,
Geological Survey, Denver, Colo.
F. A. Branson.
Reprint from Watershed Management on Range and Forest Lands; Proceedings of the Fifth Workshop of the United States/Australia Rangelands Panel, June 15-22, 1975, Boise, Idaho, p 193-209, March 1976. 27 fig, 1 tab, 68 ref.

Descriptors: *Water conservation, *Watershed management, *Evapotranspiration, *Soil-water-plant relationships, *Range management, Water users, Water harvesting, Water spreading, Runoff.
Identifiers: *Soil moisture stress, *Internal-plant stress.

Literature is reviewed and some previously unpublished information is presented for the following topics: (1) vegetation as related to precipitation and runoff, (2) vegetation-water-soil relationships, (3) water harvesting, (4) range water spreaders, and(5) water management on rangelands. Evapotranspiration quantities, often over 90 percent of precipitation that reaches rangelands, is reported for a number of plant communities. Internal-plant stress is related to many environmental variables but correlates most highly with lowest soil-moisture stress in the soil profile. Relative drought tolerance of plant species is indicated by maximal seasonal internal-plant stresses. The highest internal-plant stress measured was 117 bars for Atriplex nuttallii. Evapotranspiration estimates based on soil-moisture measurements were significantly correlated with maximum seasonal plant stress, bare soil, and percent live plant growth. In terms of plant growth, water use efficiency was lower for plants occupying dry sites than for plant of moist sites. Ancient and modern methods of harvesting water from artificial or modified watersheds are discussed. (Woodard-USGS)

uction, *Differential thermal analysis, Ther-
studies, Thermal water, Efficiencies, Cost
parisons, Engineering structures, Environ-
al effects, Cost analysis, Heat exchangers,
mal properties, Oceans, Sea water, Resource
lopment, Temperature, Heat.

Identifiers: *Sea thermal power.

Researchers have estimated that sea thermal power is capable of providing 200 times the earth's present total power needs. Sea thermal power is produced by using heat engines to harness temperature differentials between surface and depths of tropical seas. It is also a renewable energy source which is replenished daily by solar radiation. Since surface temperatures of tropical seas never falls below 78 degrees F., plants can operate on a constant basis. This eliminates the need for expensive storage and retrieval systems. Diagrams are presented to demonstrate the sea thermal power generating cycle and an electricity generating unit. Cost factors, production techniques, environmental effects, and world impact are also discussed. (Reinders-Florida)

GROWN ORGANIC MATTER AS A FUEL RAW MATERIAL RESOURCE,
Ohio Agricultural Research and Development Center, Wooster.
W. L. Roller, H. M. Keener, R. D. Kline, H. J. Mederski, and R. B. Curry.
Report NASA CR-2608, October 1975. 132 p. 12 fig., 18 tab., 83 ref., 7 append. NGL-36-007-001.

Descriptors: *Fuels, *Organic matter, *Agriculture, *Feasibility studies, Energy conversion, Bibliographies, Crop production, Photosynthesis, Plant breeding, Costs, Biomass, Fertilizers.
Identifiers: Energy supplements.

In an analysis based on an extended literature search on biomass production, only doubtful feasibility was found for producing grown organic matter for fuel in competition with food, feed and fiber on U.S. acreages. The analysis considered biomass production, production alternatives, and the production of fuel from crop residues. In the search, 169 sources were annotated in eight topical areas: (1) biomass production of specific crops, 37 sources; (2) climatic effects data, 6 sources; (3) cultural practices effects on crop production, 38 sources; (4) input/output data, 29 sources; (5) multiple species production, 8 sources; (6) photosynthetic efficiency, 10 sources; (7) auxiliary information, 21 sources; (8) summarization, 20 sources. Information was evaluated according to costs and energy needs for biomass production among many plant species. Consideration was given to anticipated water needs, nutrient requirements and the effects of climate. Costs and energy estimates were made in a simulated analysis of projected systems of biomass production, using conventional production methods for six species with high production potential. In contrast with other studies on biomass production possibilities, no assumption was made that conditions can be made favorable for maximum production at minimum input costs. (Harris-Wisconsin)

A STUDY OF THE RECURRENCE OF RAINFALL DEFICIENCY IN RELATION TO RICE CROP,
Indian Agricultural Research Inst., New Delhi.
P. N. Bhargava, P. Narain, and A. Pradhan.
Jnkvv (Jawaharlal Nehru Krishi Vishwa Vidyalaya) Res J 8(3/4), p 206-209, 1974.

Descriptors: *Rice, *Crops production, *Rainfall disposition, Growth rates.

Rainfall in July and Sept. has pronounced effect on rice yield. These months are crucial months involving the growth of the crop, flowering and seed formation period. The chance of occurrence of deficient rain in these months was of the order of 28% and 22%, respectively. The deficient rainfall in the months of July and Sept. is expected to recur on an average of every 4th and 5th yr.--Copyright 1976, Biological Abstracts, Inc.

PRODUCTION INVESTIGATIONS IN IRRIGATED AND NON-IRRIGATED WINTER WHEAT STAND DURING THE GROWING SEASON, (IN HUNGARIAN),
University of Agriculture, Godollo (Hungary).
A. Kovacs, and Z. Gaspar.
Novenytermeles 24(2), p 149-157, 1975.

Descriptors: *Wheat, *Crop production, *Irrigation, Growth rates, Sampling, Seasonal.
Identifiers: Phenophase, Winter wheat.

The effect of irrigation on phytomass production was followed in a well overwintered winter wheat (cultivar, 'Kavkaz') stand. The aboveground phytomass and the root mass by 5 cm levels were measured by phenophases (by samplings). The aboveground phytomass showed significant differences in the dynamics of development due to irrigation treatment, until the late May sampling. Due to a decline in water supply, the dry matter production decreased from flowering to ripening. This break did not show in the non-irrigated treatment where there remained a moderate tendency to increase all along.--Copyright 1976, Biological Abstracts, Inc.

CENTER PIVOT IRRIGATION,
W. Splinter.
Scientific American, Vol 234, No 6, p 90-99, June 1976. 10 p, 6 photo, 1 chart.

Descriptors: *Water demand, *Irrigation efficiency, *Irrigation engineering, *Irrigation practices,

Irrigation programs, Irrigation water, Irrigation wells, Distribution systems, Land development, Water distribution(Applied), Evapotranspiration, Leaching, Crop response, Crop production, Distribution patterns, Irrigation.
Identifiers: *Center-pivot irrigation.

Irrigation practices have not changed much in recent decades. However, the recent introduction of center-pivot irrigation is having noticeable impact. Mechanically, center-pivot irrigation involves a structured pipe system emanating from a central pivot to a length of up to one mile. Water is released at pre-planned rates and places, depending on the size and nature of the crop. Center-pivot systems are being rapidly adopted, primarily because of their automatic operation, ability to control application rate and frequency, and their easy accommodation to rolling terrain. Central-pivot have some drawbacks, however, including large, local water source requirements, and large electrical peak load periods. Development costs are approximately $350 per acre. Overall, the system's potential for widespread use seems unlimited. (Frank-Florida)

IRRIGATION WITHOUT WASTES,
K. Shea.
Environment, Vol 17, No 5, p 12-15, July/August 1975. 4 p, 1 photo, 7 ref.

Descriptors: *Irrigation, *Irrigation design, *Irrigation efficiency, *Irrigation systems, *Irrigation engineering, Water distribution(Applied), Crop response, Drainage effects, Farm management, Irrigated land, Water control, Distribution systems, Sprinkler irrigation, Furrow irrigation.
Identifiers: *Isreal.

Even though the creation of large pumping stations and concretelined canals have allowed irrigation systems to become more massive, all systems still rely on gravity for distributing needed water. Unfortunately, the oldest and most widely used irrigation method, flood irrigation, is also the most wasteful and environmentally damaging. Israel has pioneered in creating the drip, or trickle, irrigation system. Studies have shown that it is particularly useful for specialty crops, such as fruit. It consists of a head connected to a main water supply and includes filters, valves, couplings, water meter, pressure gauge, and sometimes connections for injecting fertilizers. Conducting pipes and distribution tubes carry water down the rows. To these are attached emitters that can be adjusted to release water at rates varying from one to six liters per hour. Drip irrigation uses roughly one-third to one-half the quantity of water used in sprinkle and furrow irrigation. It can be used on all types of terrain, the interrow spaces are not watered, fewer weeds grow, and dollar savings are considerable. Major problems yet to be resolved include high cost, clogging and salt buildup. (Frank-Florida)

ARK-MO FARMS, INC. V. UNITED STATES (PROBLEM OF PROOF IN RECOVERING FOR FLOOD DAMAGE TO CROPS).
530 F2d 1384-87 (Ct Cl 1976). 4 p.

Descriptors: *Judicial decisions, *Dams, *Flood damage, *Crop production, *Hydrologic aspects, Hydrologic systems, Damages, Dam design, Hydrologic data, Economics, Risks, Governments, Discharge(Water), Jurisdiction, Negligence, Penalties(Legal), Water law, Arkansas.
Identifiers: *Dam effects, *Intentional torts, *Proximate causation, *Arkansas River.

Plaintiff owner of a 10,000 acre farm on the Arkansas River sued for damage to crops allegedly caused by the closing of a government dam. The suit failed for lack of proof of causation. The flooding allegedly was the consequence of the closing of Dam No. 2 of the McClellan-Kerr Arkansas River Navigation System, a multi-purpose project primarily created to provide a navigation channel. The project includes a number of flood control structures. Detailed and unchallenged hydrological data showed that the project had in fact decreased peaks, duration, and frequency of floods. Nevertheless, in absence of proof that the closing of the dam was the cause of the floods complained of, plaintiff could not recover. (Reinders-Florida)

WATER RESOURCES OF THE WARM SPRINGS INDIAN RESERVATION, OREGON,
Geological Survey Portland, Oreg.
J. H. Robison, and A. Laenen.
Water-Resources Investigations 76-26, 1976. 85 p, 32 fig, 1 plate, 17 tab, 30 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Water quality, Data collections, Aquifer characteristics, Hydrogeology, Water wells, Water yield, Streamflow, Flow rates, Lakes, Chemical analysis, Water utilization, *Oregon.
Identifiers: *Warm Springs Indian Reservation(Oreg).

Water-resources data for the 1,000-square-mile Warm Springs Indian Reservation in north-central Oregon were obtained and evaluated. The area is bounded on the west by the crest of the Cascade Range and on the south and east by the Metolius and Deschutes Rivers. The mountainous western part is underlain by young volcanic rocks, and the plateaus and valleys of the eastern part are underlain by basalt, tuff, sand, and gravel of Tertiary and Quaternary ages. There are numerous springs, some developed for stock use, and about 50 domestic and community wells; yields are small, ranging from less than 1 to as much as 25 gallons per minute. Chemical quality of most ground water is suitable for stock or human consumption and for irrigation. Average flows of the Warm Springs River, Metolius River, and Deschutes River are 440, 1,400, and 4,040 cubic feet per second (cfs), respectively. Shitike Creek, which has an average flow of 108 cfs had a peak of 4,000 cfs in January 1974. Most streams have fewer than 100 milligrams per liter (mg/liter) of dissolved solids. Chemical and biological quality of the mountain lakes is also good; of 10 lakes studied, all had fewer than 50 mg/liter of dissolved solids and none had measurable fecal coliform bacteria. (Woodard-USGS)

FLOOD PLAIN MANAGEMENT ALTERNATIVES IN THE MAITLAND AREA (AUSTRALIA),
New South Wales Univ., Kensington (Australia).
G. M. Folie, R. Henderson, D. T. Howell, and G. D. McColl.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 1-4, June 1976. 4 ref.

Descriptors: *Flood plains, *Flood control, *Non-structural alternatives, *Australia, Flood plain zoning, Flood plain insurance, Land use, Planning, Regional development, Cost-benefit analysis.
Identifiers: *Flood plain management, Maitland(N.S.W.), Hunter River(N.S.W.).

A flood plain management system is described which has been progressively developed over the last twenty years by the New South Wales Public Works Department on the Hunter River in the vicinity of Maitland. The system is a combination of structural and non-structural measures including spillways, floodways, levee banks and flood plain zoning. The system is still being developed with the non-structural measures being refined. All the measures so far included are reviewed, and the system is evaluated in terms of economic efficiency, regional economic impact, environmental impact, and social well-being, and alternatives are considered. The future possible inclusion of flood plain insurance is discussed. Future possibilities in other flood plain management systems are reviewed in the light of the performance of this system. (CSIRO)
W77-00932

DEVELOPMENT OF FLOOD PLAIN MANAGEMENT FOR FORT COLLINS, COLORADO - A CASE STUDY OF U.S. PRACTICE,
New South Wales Univ., Kensington (Australia). Dept. of Civil Engineering.
D. H. Pilgrim, and R. A. Burns.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 5 - 9, June 1976. 11 ref.

Descriptors: *Flood plain zoning, *Flood plain insurance, *Flood protection, *Colorado, Flood plains, Non-structural alternatives, River basin development, Planning, *Australia.
Identifiers: *Fort Collins(Colo), *Flood plain management.

Development of flood plain regulations for Fort Collins, Colorado, is described as a case study of the practical application of the national programme of flood plain management that has been developed in the U.S. over the last ten years. Hydrological, hydraulic and mapping studies are outlined, and features of the regulations described. Problems encountered and approaches used in development and implementation of the regulations are emphasised. The role of public participation is discussed. The experience of communities such as Fort Collins should provide considerable help in the development of flood mitigation programmes in Australia. (CSIRO)

FREQUENCY ANALYSIS OF FLOOD DATA IN QUEENSLAND (AUSTRALIA),
Department of Primary Industries, Brisbane (Australia).
R. A. Kopittke, B. J. Stewart, and K. S. Tickle.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 20 - 24, June 1976. 1 fig., 10 tab, 9 ref.

Descriptors: *Flood frequency, *Frequency analysis, Distribution patterns, Flood forecasting, *Australia.
Identifiers: *Queensland.

Flood frequency distributions are tested for their goodness-of-fit and prediction abilities. The normal, Pearson, log-Pearson, Boughton empirical, Gumbel, log-Gumbel, Potter, log-Potter, and Weibull distributions were fitted to the annual series of flood discharges for 42 gauging stations situated mainly in eastern Queensland. Goodness-of-fit tests were applied. The data were split in half on an alternate year basis, and the various distributions applied to the halves. Prediction tests (accuracy and consistency) were then applied to these distributions. All of the results are presented in tabular form. Analysis of the results showed that the log-Pearson and the Boughton empirical distributions gave the best overall results. (CSIRO)

WATER RESOURCE EVALUATION USING PHOTOGRAMMETRIC AND REMOTE SENSING TECHNIQUES,
Laurie, Montgomerie and Pettit Ltd., Sydney (Australia).
P. R. Pettit.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 25 - 29, June 1976. 1 fig., 3 tab, 6 ref.

Descriptors: *Remote sensing, *Photogrammetry, *Satellites(Artificial), Mapping, Water resources, Flood plains.

Various airborne remote sensing techniques are described. The use of conventional photography, frequently enhanced by the use of natural or false colour for interpretive and photogrammetric purposes, will continue to be the principal remote sensing method used in water resources evaluation. The development of satellites, such as LANDSAT, which cover the earth's surface on a regular, repetitive pattern recording a variety of features, will become of increasing importance. The multi-band imagery produced may be used to present pictorial display or, alternatively, may be analysed using computer techniques. Satellites also provide a useful means of collecting and transmitting information from a large number of ground-based stations. Techniques used in flood plain mapping are emphasised. (CSIRO)

A REGIONAL STORMWATER DRAINAGE MODEL,
A. G. Goyen, and A. P. Aitken.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 40 - 44, June 1976. 2 fig., 10 ref.

Descriptors: *Mathematical models, *Storm drains, *Flood routing, *Urban drainage, Rainfall-runoff relationships, Urban hydrology, Urban runoff, Storm runoff, Flood plains.

A model is presented which analyses trunk stormwater systems involving retarding basins, natural storages and natural or artificial channels and pipes for a given storm situation. The model employs a modification of Laurenson's Runoff Routing Model for hydrograph estimation in urban and partly urbanised catchments, a modified version of the Muskingum-Cunge method for channel routing and Pul's method for the level pool routing of flood flows through storages. Hydrographs, water levels within basins, flow velocities and inundation periods are computed at defined points within the catchment. Sufficient data are available from the model to define flood plain reservations. (CSIRO)

Identifiers: *Brisbane River(Qld.), Flood stage-damage curves.

Cost-benefit studies for flood mitigation schemes and flood forecasting systems require an estimate of the river stage-damage curve. The method used to derive this curve for the Brisbane River using data from the January 1974 flood is described. A particular feature of the study was the compilation of a data bank of buildings affected by floods from the Brisbane River. The data bank consisted of essential data describing the location, size and level of over 28,000 buildings. (CSIRO)

eshore reclamation at Botany Bay, Sydney
stralia) involved extending two unformed
n stormwater drains to a tidal outfall through a
bined channel. The design was required to
imise backwater flooding in low-lying land im-
iately upstream of the existing outlets. Sub-
hment input hydrographs were prepared for
ous storm durations using temporal rainfall
ribution, and the hydrographs were routed
ugh the channel system using an open channel
sient flow programme, based on the method of
racteristics, which allowed for relative tem-
l variation between the various input hydro-
hs and the tide cycle. The results facilitated
nomic design by identifying critical sections of
channel system. Channel storage effects were
d to be significant; and the use of temporal
fall patterns was found to give higher hydro-
h peaks than the use of uniform rainfall inten-
particularly for longer duration storms.

'ENVIRONMENTAL' APPROACH TO
RMWATER MANAGEMENT IN THE ADE-
DE HILLS (AUSTRALIA),
h Australian Inst. of Tech., Adelaide.
Argue.
Hydrology Symposium, Sydney, Australia,
. The Institution of Engineers Australia,
Preprints of Papers, p. 108 - 112, June 1976. 3 fig., 14 ref.

Descriptors: *Urban drainage, *Suburban areas, *Design criteria, *Australia, Storm runoff, Urbanization, Storm water, Retention.
Identifiers: *Adelaide Hills(SA).

The establishment of urban subdivisions creates increased flooding and erosion of natural channels downstream: this problem is solved, conventionally, by straightening, widening or lining such channels. A less costly and more environmentally acceptable solution is to control runoff within subdivisions so that peak outflowing discharges differ little from those prior to development. This approach, using retention basins for temporary storage of stormwater, is examined for the case of urban subdivisions in the Adelaide hills. The study presents technical information which simplifies the joint tasks of site selection and preliminary design of the retention basins. (CSIRO)

MODELING OF NONCONTINUOUS FORT UNION AND MESAVERDE SANDSTONE RESERVOIRS, PICEANCE BASIN, NORTHWESTERN COLORADO,
C. F. Knutson.
Society of Petroleum Engineers Journal, Vol. 16, No. 4, p 175-188, August 1976. 17 fig, 7 tab, 27 ref, 2 append.

Descriptors: *Model studies, *Natural gas, *Colorado, *Rocky Mountain region, Permeability, Oil reservoirs, Hydrofracturing, Fossil fuel, Sandstones, Deep wells, Statistical models, Drillers logs, Well spacing.
Identifiers: *Random models, *Fort Union sandstone, *Mesaverde sandstone, Channel fill deposits, Point bar deposits, Well stimulation, Length-width-thickness ratios.

A recent Federal Power Commission study indicated up to 600 trillion ft of natural gas in place in the Rocky Mountains in low-permeability Cretaceous and Tertiary nonmarine sandstones. This type of reservoir rock was studied in the surface and subsurface in the Piceance Basin area of northwestern Colorado. The sandstone geometry and orientation were characterized. A 'random in-

tersection' technique was developed that used the geological information to generate a spectrum of reservoir models that may be used to simulate the performance of conventional as well as hydraulically and nuclearly fractured wells. Example reservoir models for fractured wells were compared with reservoir models for nonfractured wells. In general, point-bar sandstones could be simulated by radialmodels and channel-fill sandstones by linear models. In a sequence of channel-fill sandstone with Piceance Basin geometry, an average well was connected to about 18% of the in-place reservoir volume in a 320-acre area. Connected reservoir volumes of greater than 70% in a 320-acre area were calculated for fractured wells with fracture wing dimensions of 2000 ft, with actual values depending on fracture extent and pervasiveness. The percent of connected reservoir volume decreased as well spacing increased. (Visocky-ISWS)

ARTIFICIAL RECHARGE IN THE GRAND PRAIRIE, ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Agricultural Engineering.
C. L. Griffis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 610, Price codes: A02 in paper copy, A01 in microfiche. Agricultural Experiment Station, Fayetteville, Bulletin 810, August 1976. 7 p, 3 fig, 5 tab, 7 ref. OWRT A-020-ARK(2).

Descriptors: *Artificial recharge, Bench scale studies, Runoff, Polyelectrolytes, *Arkansas, Rice, Water supply, Groundwater movement, Water wells, *Water treatment.
Identifiers: Grand Prairie(Ark).

The Grand Prairie is located in east-central Arkansas between the White River and Bayou Meto. The area is primarily agricultural, with rice being one of the major crops. This rice requires a considerable amount (22 inches) of water each year, and most of the water for this purpose is pumped from underground wells. As a result, the supply of water in the water-bearing strata underground is being depleted faster than it is being replaced. For this reason, some means of artificially replinishing the water in the aquifer is needed. Bench-scale tests showed that a sand-filled, gravity-flow recharge well was not suitable for recharging untreated runoff water in the Grand Prairie. A series of studies then was made to search for a low-cost water treatment system. The water treatment techniques studied included the use of alum, cationic and anionic polyelectrolytes, lime, and magnesium hydroxide. In addition, some studies included combinations of two or more of the chemicals, and in one series of tests the sludge formed in one batch of treated water was used as seed material for the next batch. No treatment method was able to clarify the water for a cost less than the target cost of $5 per acre foot. Other sources for recharge water were examined and the most likely candidates were found to be the drainage water from flooded rice fields, and rainwater collected on the fields during the off-season for rice production. Use of the first water source presents problems. The latter possibility is now under study.

EVALUATION OF ALTERNATIVE METHODS OF SUPPLEMENTAL RECHARGE BY STORM-WATER BASINS ON LONG ISLAND, NEW YORK,
Geological Survey, Albany, N.Y.
D. A. Aronson.
Open-file report 76-470, 1976. 56 p, 9 fig, 4 tab, 23 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Reclaimed water, *Storm runoff, *Pit recharge, Methodology, Infiltration, Numerical analysis, Model studies, Design storm, Controlled drainage, Evaluation, *New York, Alternative water use.
Identifiers: *Long Island(NY), Dual-purpose basins.

Many of the more than 2,200 storm-water basins on Long Island, N.Y., having runoff and infiltration characteristics similar to those of a basin studied in North Massapequa are potential sites for returning large volumes of reclaimed water (highly treated waste water) to the ground-water reservoir. By use of a finite-difference method of calculation, formulas were devised to calculate changes in basin storage at various time intervals from the start of storm inflow, with and without addition of reclaimed water. The North Massapequa storm-water basin was the prototype design used to test several methods of water application. Calculations using various infiltration rates, storm durations, and storm-return periods indicate that several methods of applying reclaimed water to storm-water basins on Long Island would be feasible. AVAILABILITY OF GROUND WATER IN AREA SURROUNDING THE TRIDENT MARINE CONSTRUCTION FACILITY, KI COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
A. J. Hansen, Jr., and D. Molenaar.
Open-File Report 76-351, 1976. 30 p, 15 fig, 5

Descriptors: *Water resources, *Ground availability, *Water demand, *Potential supply, *Aquifer characteristics, Constru Sites, Surface waters, Hydrologic data, water intrusion.
Identifiers: *Kitsap County(Wash), Pre-con tion survey.

General information is presented on resources--with emphasis on ground-water rence and availability--in that part of Kitsap ty (referred to as Trident Impact Area) that be most affected by the development o Trident submarine construction facility at Ba Washington. The estimated 1970 water use study area averaged about 13 million gallo day (mgd); of this amount about 9 mgd came surface-water sources--from a large reservoi side the study area--and about 4 mgd came ground water pumped from two aquifers area. Anticipated water use soon will be ab to 21 mgd; virtually all the additional qu required (about 5 to 8 mgd) above present us come from ground-water sources. Prelim evaluation of the aquifers suggests that an tional 1.5 mgd can be developed from the aquifer and 7 mgd from the lower aquifer. E wells tapping the lower aquifer might yield tional water and increase the total yield in th by 3.5 mgd, and new wells drilled in selected could produce an additional 3.5 mgd fro aquifer. However, additional, large-scale g water withdrawal from the lower aquifer co duce saltwater intrusion into wells situa coastal areas. (Woodard-USGS)

4C. Effects On Water Of Man's Non-Water Activities

THE IMPACT OF PROPOSED FEDERAL ENERGY DEVELOPMENT ON WESTERN WATER RESOURCES,
In: Energy, Water, and the West,November 2-5, 1975, Albuquerque, p 11-17, May 1976. 5 append.

Descriptors: *Energy, *Future planning(Projected), *Water resources development, *Water requirements, Coals, Oil shales, Human population, Water users, Water demand.
Identifiers: *Western U. S.

Two authors report on projected federal energy development in the west and the impact of energy decision on water use in that region. Almost half of the nation's known coal reserves lie in the western states, with about 60% under federal jurisdiction. Western coal is attractive because of its low sulfur content and easier access in many locations. Planning and development for this resource and for oil shale are discussed. Water demands for conversion of coal are substantial; some possible water sources and their limitations are outlined. Also discussed are the impacts of growth, especially in small communities unprepared for it, and mitigating environmental impacts. Interior Department policies for total water management, coal exporting and intergovernmental cooperation are presented. The Arab influence on energy problems has been substantial, and energy independence requires drawing on western resources. Approximately 2 million acre-feet a year of new water will be needed in the Northern Great Plains and Colorado Basin by 1985. The key issue may be competition between potential users for available water. Government intervention will probably be necessary to manage some of this uneven economic competition. Recommendations for state and local action are outlined. (See also W77-00542) (Jahns-Arizona)

EFFECT OF PRESCRIBED BURNING ON SEDIMENT, WATER YIELD, AND WATER QUALITY FROM DOZED JUNIPER LANDS IN CENTRAL TEXAS,
Texas Tech Univ., Lubbock. Dept. of Range and Wildlife Management.
H. A. Wright, F. M. Churchill, and C. S. Stevens.
Journal of Range Management, Vol. 29, No. 4, p 294-298, July, 1976. 2 fig, 4 tab, 32 ref. OWRT C-3191(No 3699)(3), 14-31-0001-3699.

Descriptors: *Sediment discharge, *Water quality, *Runoff, *Turbidity, *Watersheds(Basins), Water management(Applied), Water supply, Seepage, Erosion, Slopes, Burning, *Texas.
Identifiers: *Rainfall frequency, *Rainfall intensity, Central Texas, Limestone-derived soil, *Prescribed burning.

Prescribed burning was applied to six minivatersheds that were each paired with an unburned watershed on limestone-derived soils in Central Texas. Erosion losses, runoff, and water quality were unaffected on level areas, but adverse effects lasted for 9 to 15 months on moderate slopes (8-20%) and for 15 to 30 or more months on steep slopes (37-61%). Soil losses were 1 ton/acre on 15% slopes and 6 to 8 tons/acre on steep slopes. Rates of erosion losses stabilized within 18 months on all slopes when vegetative cover reached 63 to 68%. Quality of water was soft from level areas, moderately hard for 6 months on 15 to 20% slopes, and moderately hard for 15 to 30 or more months on 45 to 53% slopes. Turbidity stayed above the controls for 1 1/2 years on moderate slopes and for 3 to 4 years on steep slopes. Slopes greater than 20% should not be converted from shrubs to grass and left to heal naturally.

AIRFLOW PATTERNS AND SNOW ACCUMULATION IN A FOREST CLEARING,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. L. Gary.
In: Western Snow Conf. (Coronado, Calif., April 1975) Proc. 43, p 106-113.

Descriptors: *Clear-cutting, *Snow management, Snowmelt, Air circulation, *Snowpacks, Watershed management, *Forest management, Water yield improvement, *Lodgepole pine trees.

Snow accumulation and airflow patterns were measured before and after establishing a clearing 1 tree-height wide and 5 tree-heights long in a lodgepole pine forest. The long axis was normal to prevailing wind. The profile of accumulated snow, less the mean amount of snow upwind of the clearing, was compared with the streamline patterns of airflow. Snow profiles are shown for 2 years where annual accumulation varied by a factor of 2. Snow accumulation was maximum in the clearing and minimum just behind the lee clearing edge. The maximum was centered about the upwind edge of the back eddy of airflow in the clearing. The minimum coincided with the downwind edge of the same eddy. These comparisons suggest that clearings may become saturated similar to snowfence systems, and that the accumulation pattern reflects primarily wind drift of falling snow rather than subsequent erosion and redeposition. SEDIMENT YIELD FROM CONSTRUCTION SITES,
MITRE Corp., McLean, Va. Dept. of Environmental Assessment.
R. L. Holberger, and J. B. Truett.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-47 - 1-58, 1976. 1 fig, 3 tab, 16 ref.

Descriptors: *Sediment yield, *Construction, *Model studies, Mathematical studies, Sediments, Erosion, Runoff, Precipitation(Atmospheric), Rainfall, Forecasting, Sediment load, Sediment transport, Soil erosion, Streamflow, Sedimentology.

Two sediment loading functions were fitted to sediment loss data from eight field studies of construction sites. Both were adaptations of the Universal Soil Loss Equation, and involved an empirically-fitted factor to account for effects of intervening terrain between construction site and point of sediment measurement in a nearby watercourse. One function used the distance from the foot of the exposed area to the nearest perrenial stream, while the second function used the percent of the drainage basin undergoing construction. Comparison of predicted sediment yields (in tons/acre) with observed yields indicated that, for the first loading function, about 54% of the predictions fell within a range of + or - 50% of observed values. Approximately 30% of the predictions generated by the second method fell within + or - 50% of the observed values. (See also W77-00775) (Sims-ISWS)

DEBRIS FLOWS FOLLOWING WILDFIRE IN NORTH CENTRAL WASHINGTON,
Forest Service (USDA), Wenatchee, Wash. Pacific Northwest Forest and Range Experiment Station.
G. O. Klock, and J. D. Helvey.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-91 - 1-98, 1976. 1 fig, 4 ref.

Descriptors: *Erosion, *Washington, *Forests, *Forest fires, *Floods, Precipitation(Atmospheric), Precipitation excess, Streams, Streamflow, Flood flow, Wastes, Flash floods, Storm runoff, Sediments, Sedimentation, Alluvial fans, Alluvium, Channels, Channel morphology.
Identifiers: *Debris torrents, *Entiat River, Debris.

A combination of rapid snowmelt, high intensity rainstorms, and fire-denuded watersheds resulted in massive debris torrents from numerous tributary streams of the Entiat River in north-central Washington during the spring and summer of 1972. Debris torrents were summarized by location, soil type, topography, and land use history for five adjacent watersheds. Alternative forest management recommendations were suggested for minimizing the impact of possible future debris torrents within the study area. (See also W77-00775) (Sims-ISWS)
W77-00783

EROSION AND SEDIMENT FROM FOREST LAND USES, MANAGEMENT PRACTICES AND DISTURBANCES IN THE SOUTHEASTERN UNITED STATES,
Forest Service (USDA), Atlanta, Ga. Southeastern Area.
G. E. Dissmeyer.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 1-140 - 1-148, 1976. 1 fig, 5 tab, 2 ref.

Descriptors: *Erosion, *Sediment yield, *Forests, *Southeast U. S., Forest management, Forest watersheds, Forest fires, Sediment discharge, Sediments, Suspended solids, Sedimentation, Water quality, Roads, Grazing, Land use, Storm runoff, Watersheds(Basins).

The data and information presented defines the nature, extent, and magnitude of erosion and sediment sources from several forested river basins in the Southeastern United States. Data showed that not all sediment from forest land is related to silviculture, but in some areas, past abusive agriculture and present woodland overgrazing are the most important sources of sediment. Data also showed that forest practices acts, which contain blanket regulations, are likely to be inappropriate for some areas, insufficient for others, or sometimes unnecessary. It was concluded that control of forest sediment needs to be prescriptive and site specific in nature to meet not only water quality, but other resource needs. (See also W77-00775) (Sims-ISWS)

GEOTECHNICAL MANAGEMENT OF FOREST LANDS IN GRANITIC TERRANE,
Forest Service (USDA), Medford, Oreg. Rogue River National Forest.
B. G. Hicks.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 2-83 - 2-90, 1976. 5 ref.

Descriptors: *Forests, *Forest management, *Lumbering, *Landslides, Rainfall, Erosion, Soil erosion, Road construction, Granites, Weathering, Erosion control, Slopes, Projects, On-site investigations, Mountains.
Identifiers: *Granitic terranes, Granitic rocks.

Weathered granitic rocks have historically created problems for forest land management. Specialists are working to minimize the environmental damage resulting from road construction and logging impacts. Problems result when entry is made into steep granitic terrane with high rainfall where road construction and logging is planned. The damage is largely due to liquefaction type failures which produce greatly accelerated mass wasting as a result of debris landslides and flows. This geotechnical scheme was a unique plan for forest land management which produces a quantitative program for an environmentally safe operation and will yield an economically feasible project. The format of the scheme was: (1) Select a granitic area with stability problems, prepare detailed topographic map and obtain color and color infrared photography. (2) Hydrologic monitoring. (3) Engineering geologic study: mapping, drilling, sampling, geophysical surveys, field testing for stability parameters. (4) Soil engineering: lab and model test representative samples and compute stability parameters. (5) Correlate field properties with lab and model tests. (6) Prepare stability unit map. (7) Develop logging and road construction project using stability map and road design data. (See also W77-00775) (Sims-ISWS)

NUTRIENTS LOST IN DEBRIS AND RUNOFF WATER FROM A BURNED CHAPARRAL WATERSHED,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano, and C. E. Conrad.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 3-13 - 3-27, 1976. 1 fig, 4 tab, 24 ref.

Descriptors: *Nutrient removal, *Runoff, *Erosion, *California, Nutrients, Chaparral, Burning, Slopes, Litter, Watersheds(Basins), Nitrogen, Phosphorus, Calcium, Magnesium, Sodium, Potassium, Chemistry, On-site investigations, laboratory tests, Water quality.
Identifiers: *Prescribed burning, Nutrient loss.

Runoff water and movement of debris were measured on a chaparral-covered watershed, in southern California, that was prescribe-burned in summer 1973. Plant nutrients in the runoff water and debris during the first rainy season were analyzed. The amounts of N, P, Ca, Mg, K, and Na in the soil, litter, and plant material after burning, but before erosion occurred, were measured. In the first year, an area with 50% slopes had about 7300 kg/ha (6300 lb/ac) of material eroded from the plots on the burned sites as compared to only 210 kg/ha (187 lb/ac) on similar unburned sites. On the burned area, less debris was lost from the plots having 20% slopes than from those on steeper sites. No erosion occurred on unburned slopes with a 20% slope. The total amount of nutrients lost in debris and runoff water from the steep slopes that burned, in kg/ha (lb/ac), were: nitrogen—15.1 (13.5); phosphorus—3.4 (3.0); potassium—27 (24.1); magnesium—31.6 (28.2): calcium—67.4 (60.2); and sodium—4.6 (4.1). Nutrients lost represented less than 6% of the total nutrient found in the upper 2 cm (0.79 in) of the soil and litter layer immediately after the fire. (See also W77-00775) (Sims-ISWS)

SEDIMENT RUNOFF DURING HIGHWAY CONSTRUCTION,
Geological Survey, Harrisburg, Pa.
W. G. Weber, Jr., and L. A. Reed.
Reprint from Civil Engineering--ASCE, March 1976: ASCE Irrigation and Specialty Conference in Ottawa, Canada, July 1976. 4 p, 4 fig, 1 tab.

Descriptors: *Sediment control, *Road construction, *Pennsylvania, Highways, Sediment transport, Retaining walls, Ponds, Vegetation, Watersheds(Basins), Erosion control, Methodology, Evaluation.
Identifiers: *Harrisburg area(Pa), Interstate-83, Construction(Pa).

The Pennsylvania Department of Transportation and Environmental Resources (State Conservation Commission) and the U.S. Geological Survey are cooperating in a field study to determine the effectiveness of various erosion-control measures during highway construction on I-81. Hydrologic parameters including water and sediment flow are being monitored in five adjacent watersheds near Harrisburg, Pa. Different types of erosion control measures are being used in each watershed to prevent soil exposed by the construction activity from entering the stream system. The area under active construction correlates well with the sediment load transported by the streams. The onsite holding devices, such as off-stream ponds appear to be the most effective method of sediment control on this project. Seeding and mulching have minor effect on sediment production until vegetative growth is well established. The placing of the subbase had a major effect on sediment production due to the large exposed area involved. (Woodard-USGS)

evelopment and preliminary testing of a model,
ased on kinematic wave equations, for calculat-
g stormflow hydrographs for steep mountain
tchments, and particularly to assist in detecting
anges due to clearfelling and other forest opera-
ons, is described. Simplifying assumptions were
ade to reduce the number of parameters to three:
rainfall intensity scale, a constant loss rate, and a
easure of channel conveyance. A system of scal-
g was developed to reduce the amount of compu-
tion characteristic of kinematic wave theory; a
ll set of integrations need only be done for each
vel of loss rate, hydrographs for any combina-
on of the other parameters can be obtained by ad-
sting the distance and streamflow concentration
ales. Calculation of hydrographs for a simple
onstant intensity storm illustrate the basic pro-
erties of the model, and a preliminary test appli-
ation to a hydrograph from an experimental
tchment is described. (CSIRO)

Identifiers: *Landform development, Channel nickpoints, Dynamic equilibrium, Longitudinal stream profile, Fraser Experimental Forest, Arizona White Mountains.

Watersheds represent an important landform. Knowledge of their stage of development tells about future watershed behavior. This is critical for watershed management because man may enhance or hinder future natural processes. Dynamic characteristics of two perennial and two ephemeral mountain streams revealed that the former are in a state of dynamic equilibrium, while the latter are still working toward its attainment. Bed characteristics indicated that both aim at adjustment to slope by formation of rock and log bars. Thus, the surrounding forest plays an active role in stream hydraulics. (Forest Service)

WATERSHED EROSION MODEL VALIDATION FOR SOUTHWEST IOWA,
Agricultural Research Service, Morris, Minn. North Central Soil Conservation Research Center.
C. A. Onstad, R. F. Piest, and K. E. Saxton.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-22 - 1-34, 1976. 3 fig, 5 tab, 8 ref.

Descriptors: *Erosion, *Watersheds(Basins), *Model studies, *Iowa, Mathematical models, Sediments, Sedimentation, Sediment yield, Soil erosion, Runoff, Rainfall, Precipitation(Atmospheric).

Watershed erosion data from two Agricultural Research Service watersheds near Treynor, Iowa were used to test an erosion model developed by Onstad and Foster. This model utilized a distributed set of input variables and included a detachment and a transport phase. Depending on the magnitude of each phase, soil was either eroded or deposited. Predicted sediment yields from sheet-rill sources were compared with measured yields for single events and with predictions by the universal soil loss equation developed by Wischmeier and Smith and the Williams model. A sensitivity analysis was performed for the fitted parameter in the Onstad-Foster model. Confidence intervals were also calculated for a wide range of single-event sediment yields. These results showed that the Onstad-Foster model performed better than the other two models for the storms tested. (See also W77-00775) (Sims-ISWS)

SEDIMENT SOURCES AND YIELDS FROM SAGEBRUSH RANGELAND WATERSHEDS,
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
C. W. Johnson, and C. L. Hanson.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-71 - 1-80, 1976. 1 fig, 4 tab, 11 ref.

Descriptors: *Sediment yield, *Runoff, *Ranges, *Watersheds(Basins), *Idaho, Sediments, Suspended solids, Bed load, Bed load samplers, Weirs, On-site investigations, Surveys, Rainfall, Precipitation(Atmospheric), Drainage, Model studies, Mathematical models, Sedimentology.
Identifiers: *Reynolds Creek Watershed(Idaho).

Average sediment yields from the Reynolds Creek Experimental Watershed and three subwatersheds ranged from 1.14 to 1.90 tonnes/ha/year (0.51 to

0.85 tons/ac/year) during the study period. Yields were more than tenfold higher in wet than in dry years, and about 90% of average yearly yield occurred during January, February, and March at the Reynolds Outlet Station. Sediment yields from six upland source areas, 0.9 to 83 ha (2.25 to 205 acres), were one-third or less per unit area than those from larger downstream watersheds. Bedload transport data collected by use of Helley-Smith bedload samplers showed that bedload averaged about 20% of total sediment yield. Analysis of runoff-sediment events by parameter optimization showed excellent correlation between suspended sediment volume and combined peak flow and runoff volume. The procedure should be useful in predicting sediment yields from similar areas having a minimum of sediment data. (See also W77-00775) (Sims-ISWS)
W77-00781

SEDIMENT YIELDS FROM A MISSISSIPPI DELTA WATERSHED,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
C. E. Murphree, C. K. Mutchler, and L. L. McDowell.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-99 - 1-109, 1976. 3 fig, 2 tab, 7 ref.

Descriptors: *Sediment yields, *Runoff, *Farm management, *Mississippi, Rainfall, Precipitation(Atmospheric), Sediments, Clays, Silts, Crops, Cotton, Agriculture, Erosion, Agricultural chemicals, Herbicides, Pollutants, Regression analysis, Soil erosion, Agricultural runoff, Sedimentation.

Runoff and sediment yield were measured on a Mississippi Delta watershed, land-formed to 0.2% slope, and farmed in continuous cotton. Interest in sediment yields and hydrology of the flatland watersheds of the Lower Mississippi River Valley or Delta (as it is commonly known) had increased greatly due, primarily, to the concern that agricultural chemicals may be transported into streams and lakes by sediment and runoff waters from farmlands. However, sediment yields indicated a serious erosion problem; 28.98 MT/ha/year (12.93 tons/acre/year) were lost from a 15.58-ha (38.5-acre) watershed during a 2-year period. Because rainfall in these 2 years was extremely high (33% above the 17-year average), long-term average annual sediment yield values should be lower. (See also W77-00775) (Sims-ISWS)
W77-00784

SIMULATING EROSION DYNAMICS WITH A DETERMINISTIC DISTRIBUTED WATERSHED MODEL,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
R. E. Smith.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-163 - 1-173, 1976. 5 fig, 15 ref.

Descriptors: *Erosion, *Model studies, *Watersheds(Basins), Mathematical models, Flow, Equations, Streamflow, Precipitation(Atmospheric), Rainfall, Hydraulics, Kinetics, Runoff, Mathematical studies, Suspended solids, Sediments, Sediment yield, Infiltration, Pollutants.
Identifiers: Differential equations.

A simulation model was described which incorporated the differential equation for continuity of suspended sediment into a kinematic numerical model for hydraulic response of a watershed surface. The model was practical since it included an advanced infiltration function and had the ability to accept complex rainfall patterns. The structure of the model allowed the simulation of relatively complex watershed shapes using a watershed composed of small branched channels fed by an arrangement of non-rectangular, converging planes with distorted slopes. The realism of the model's ability to simulate sediment production was limited by the necessity to specify rather empirical functions for soil detachment rates from rainfall impact and from flowing water. It was learned that either tractictive force or stream power function may be chosen as a model for sediment-carrying capacity. Several examples were shown to demonstrate the capabilities of such a dynamic and distributed simulation of watershed sediment production, including effects on erosion of rainfall patterns, slope convergence, and comparative sediment-production rainfall, overland flow, and channel flow. (See also W77-00775) (Sims-ISWS)
W77-00788

SEDIMENTATION OF A FLATLAND WATERSHED IN LOUISIANA,
Soil Conservation Service, Alexandria, La. Watershed Planning and River Basin Studies.
C. R. Akers.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 1-174 - 1-180, 1976. 1 fig, 7 ref.

Descriptors: *Sedimentation, *Watersheds(Basins), *Louisiana, *Mississippi River, Marshes, Levees, Bayous, Runoff, Erosion, Suspended solids, Sediments, Sampling, Rainfall, Simulated rainfall, Soils, Soil erosion, Sheet erosion, Sediment yield, Agricultural runoff, Sedimentology.
Identifiers: *Bayou Fafourche(La).

Recent emphasis on the downstream effects of the Public Law 566 flatland watersheds has created an additional need to examine the various aspects of the sedimentary process in areas of low relief. Presently accepted evaluation procedures were developed in areas of greater relief and generally dealt with coarser soils. The data for evaluation described here was a joint effort between the Agricultural Research Service (ARS), the United States Geological Survey (USGS), and the Soil Conservation Service (SCS). Each group has unique expertise, and the coalition of this expertise is expected to furnish the maximum knowledge in minimum time at minimum expense. Basic sheet erosion was determined by ARS using a 'rainfall simulator.' Sediment in transport was measured by USGS using PS-69 samplers. Rates of sediment deposition were measured by ARS using Cesium-137 concentrations as date markers. SCS monitored activities that affect the land, providing personnel in the immediate area, correllating activities dealing with the study, analyzing results of the various studies, and evaluating the elements of the sedimentary process. WATER AND SEDIMENT ROUTING FROM SMALL WATERSHEDS,
Colorado State Univ., Fort Collins, Dept. of Civil Engineering.
R-M. Li, M. A. Stevens, and D. B. Simons.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 1-193 - 1-204, 1976. 5 fig, 5 ref.

Descriptors: *Model studies, *Sampling, *Sediment yield, *Hydrographs, Rainfall, Precipitation(Atmospheric), Runoff, Erosion, Soil erosion, Watersheds(Basins), Sediments, Sedimentation, Infiltration, Sheet erosion, Channel erosion, Mathematical models, Hydraulics, Routing, Storms, Streamflow.

In many past studies, a statistical interpretation o observed data has been utilized to solve sediment yield and related problems. It is difficult to predic the response of a watershed to various lan developments or treatments using these method because they are based on the assumption o homogeneity in time and space. Numerica modelling using equations describing the physica processes is a viable way to study the effects o various watershed treatments or land develop ments on water and sediment yields fro watersheds. The numerical model presented in thi paper simulated the physical processes by whic water and sediment are moved overland to an down creeks and rivers in watersheds. Some of th processes modeled were interception and infiltra tion from rainfall, overland flow from excess rai fall, sediment production due to raindrop impac sheet erosion by overland flow, channel erosio and the water and sediment routing through th channel system. A nonlinear kinematic-wave ap proximation for flow routing was used to rou water and sediment overland and in channels. Fo the watershed simulated, the computed water an sediment yields agreed with the measured wat and sediment yields. In addition, this model ha the capability to predict watershed treatment e fects on individual water and sediment hydr graphs and long-term yields, and to identify th sediment sources in watersheds. THE HYDROLOGIC AND SEDIMEN PROCESSES IN NATURAL WATERSHE AREAS,
Hydrocomp International, Palo Alto, Calif.; an Hydrocomp International, Glasgow (Scotland).
G. Fleming, and K. M. Leytham.
In: Proceedings of the Third Federal Inter-Agenc Sedimentation Conference, 1976; Denve Colorado, March 22-25, 1976. Water Resource Council, Washington, D. C., Sedimentation Con mittee, p 1-232 - 1-246, 1976. 1 fig, 13 ref.

Descriptors: *Sedimentation, *Sediments, *Mod studies, Data collections, Data processin Hydrology, Soil erosion, Rainfall, Runoff, She erosion, Land use.
Identifiers: *Sediment processes.

In a world rather belatedly concerned with ration use of its resources, the understanding, predictio and control of sediment processes is becoming topic of some considerable importance. Sedime may effectively limit the useful life of stora facilities in some parts of the globe and in othe sheet erosion and resulting soil degradation m be fatal to both human life and a nation's viab exstence. Advanced countries and various intern tional agencies must work to develop approach of universal applicability for land use manageme in the widest meaning of the word. The widespre practical application of conceptual sedime models would appear to be limited by serio shortages of basic data. This is true even for sim ple models such as Negev's, although it is hop that sufficient data may be obtainable for its use be viable within the U.S.A. One problem is that this multi-disciplinary subject, data sources a widely scattered, often in obscure places. Th establishment of some control archive for da concerned with land-use activities and manag ment could be of considerable value. Anoth problem which has been recognized in the past the chaotic state of sediment transport study wi its enormous variety of definitions and term units, methods of measurement and a very confu

array of formula and equations which often do explicitly state assumptions of limits of applicability. (See also W77-00775) (Sims-ISWS)

MPARATIVE COSTS OF EROSION AND DIMENTATION CONTROL MEASURES,
igation/Agriculture Engineering-Science, Inc., rkeley, Calif.
H. Ateshian.
In: Proceedings of the Third Federal Inter-Agency dimentation Conference, 1976; Denver, lorado, March 22-25, 1976. Water Resources uncil, Washington, D.C. Sedimentation Committee, p 2-13 - 2-23, 1976. 1 fig, 2 tab, 5 ref.

scriptors: *Erosion control, *Sediment control, ost comparisons, *Construction costs, onomics, Soil erosion, Sediments, Sedimentan, Rainfall, Runoff, Control structures, Conuction, Hydraulic structures, Sedimentary uctures, Equipment, Materials, Labor.

st information on erosion and sediment control asures for 25 methods in current widespread were presented in a manner to provide a sound sis for estimating local costs. Using three prinal cost elements: materials, labor, and equipnt, the detailed unit costs presented can also be -dated to reflect inflationary trends in conjuncn with an accepted cost index such as the ENR nstruction Cost Index. The simplified ocedures developed for estimating rainfall ero- index permit the prediction of soil loss (using Universal Soil-Loss Equation) for selected tersheds. The cost data, when applied to soil ses, will reflect comparative costs per ton of l retained. Control effectiveness and economic e of each method can then be used to determine mparable annual cost figures. With this final p, the process of engineering decision-making d selection can be greatly simplified. (See also 77-00775) (Sims-ISWS)

IL RIPPING TREATMENTS FOR RUNOFF ND EROSION CONTROL,
rest Service (USDA), Albuquerque, N. M. cky Mountain Forest and Range Experiment ation.
F. Aldon.
In: Proceedings of the Third Federal Inter-Agency dimentation Conference, 1976; Denver, lorado, March 22-25, 1976. Water Resources uncil, Washington, D. C., Sedimentation Committee, p 2-24 - 2-29, 1976. 8 ref.

scriptors: *Erosion control, *Runoff, *Arid ds, *New Mexico, Vegetation, Vegetation effcts, Watersheds(Basins), Soils, Ranges, ainage, Plant growth, Pastures, Forage grasses, nge grasses, Rainfall.
ntifiers: *Soil ripping, *Rio Puerco(NM).

il ripping, a form of deep, wide plowing, effecely reduces runoff and erosion from semi-arid tersheds. This treatment has been used by land nagers on highly erosive soils in the Rio Puerco inage of New Mexico to hold moisture where it ls, therby increasing plant growth and decreas- erosion. This paper reported on a study done and near the San Luis Watersheds on the Rio erco drainage, 93 km (58 miles) northwest of Alquerque, New Mexico, in the transition zone tween woodland and semi-desert grassland. The a is comprised of mesas or uplands, steep rocky aks, and alluvial grasslands. Surface runoff s still reduced 85% and erosion 31% 3 years er the soil ripping treatment. Treatment effeeness declined after 3 to 5 years depending on ounts and intensities of summer thunderstorms. ening old rips that were sealed over with sedint was as effective in controlling runoff as ping between old rips. Reripping by either thod reduced runoff by two-thirds compared h untreated check plots. Ripping caused a favorable shift in forage production from galleta to alkali sacaton. It was learned that ripping effects on runoff are short-lived, but forage production patterns may persist for 10 years; ripping must be done carefully to avoid subterranean channel formation (erosion by soil piping). EXCAVATED SEDIMENT TRAPS PROVE SUPERIOR TO DAMMED ONES,
Forest Service (USDA), Rolla, Mo. National Forests in Missouri.
C. P. Tryon, B. L. Parsons, and M. R. Miller.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 2-42 - 2-51, 1976. 4 fig, 4 ref.

Descriptors: *Sediment control, *Excavation, *Settling basins, *Missouri, Runoff, Dams, Sedimentation, Construction, Construction costs, Drainage, Industries, Earthworks, Drainage engineering, Controlled drainage, Surface runoff, Sedimentology.
Identifiers: *Sediment traps, Detention dams, Excavated sediment traps.

Stilling basins and various other kinds of small impoundments have been used to trap eroded sediment for many years. Numerous publications, people, and agencies seek to increase their use by extolling their merits. Virtually nowhere, however, is the idea of excavated--rather than impounded--sediment traps even mentioned, let alone recommended as a superior method of accomplishing the sediment control task. A decade of experience on large earth moving jobs in the rugged Missouri Ozarks has shown that excavated sediment traps are incomparably superior to small detention dams in terms of cost, industry acceptance, and sediment trap efficiency. This 'how to' article was a working man's guide to excavated sediment trap design and construction. (See also W77-00775) (Sims-ISWS)
W77-00797

EROSION AND SEDIMENT CONTROL ON RESHAPED LAND,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
L. D. Meyer, and M. J. M. Romkens.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 2-65 - 2-76, 1976. 7 fig, 1 tab, 26 ref.

Descriptors: *Erosion control, *Sediment control, *Land forming, Rainfall, Runoff, Topography, Soils, Slopes, Mulching, Erosion, Soil erosion, Sedimentation, Settling basins, Vegetation, Road construction, Urbanization, Construction.
Identifiers: Soil erodibility, Erosive potential, Sediment traps.

Recent research concerning soil erosion and sediment control on land reshaped for nonagricultural purposes was discussed. Included in this discussion were: adaptation of the Universal Soil Loss Equation, variability of rainfall erosiveness, evaluations of soil erodibility and topographic effects, influence of mulch rates and types, and enhancement of rapid revegetation. Implications of this knowledge and areas of research needs were indicated. (See also W77-00775) (Sims-ISWS)

DEFINING THE SEDIMENT TRAPPING CHARACTERISTICS OF A VEGETATIVE BUFFER. SPECIAL CASE: ROAD EROSION,
Forest Service, Denver, Colo. Rocky Mountain Region.
C. A. Ohlander.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 2-77 - 2-82, 1976. 1 tab, 10 ref.

Descriptors: *Sediment control, *Drainage, *Roads, *Vegetation, Erosion, Sediments, Vegetation effects, Sedimentation, Highways, Runoff, Soils, Soil erosion, Water quality, Equations.
Identifiers: *Road drainage, Standard buffer, Sediment traps, Runoff curve number.

This paper discussed the amount of sediment trapped by a vegetative buffer that may exist below a road drainage outlet. The buffer characteristics were defined in relationship to slope percent, soil erodibility, and a soil-cover complex index called the Runoff Curve Number (RCN). A Standard Buffer was defined as a particular length of site capable of trapping 953 kilograms of sediment per year: Standard Buffer, meters = (16.16 + 17.69 Soil K + 1.34 Slope percent) x (31RCN)/(6900 - 69 RCN), where: Standard Buffer is the slope distance needed for filtering out the sediment, soil 'K' is the soil erodibility index from the universal soil loss equation, and RCN is the Runoff Curve Number from the Soil Conservation Service Engineering Handbook. It was found that the ratio of actual buffer distance to the Standard Buffer distance times 953 kilograms equals the yearly sediment trapped. It was concluded that the relationship of Road Erosion minus Sediment Trapped has implications that can be used as a first approximation of some land use effects on water quality. EVALUATION OF AN EXTENSIVE SEDIMENT CONTROL EFFORT IN THE LOS ANGELES RIVER BASIN,
Forest Service (USDA), Turlock, Calif. Stanislaus National Forest.
E. C. Ruby.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 2-91 - 2-102, 1976. 7 fig, 3 ref.

Descriptors: *Sediment control, *Dams, *Sediment yield, *California, Floods, Forests,

Forest fires, Regression analysis, Sedimentation, watersheds(Basins), Sediments, Sedimentary structures, Sediment transport, Runoff, Rivers, Erosion.
Identifiers: *Check dams, *Los Angeles River Basin(Calif).

The Los Angeles River Flood Prevention Project, authorized by Congress in 1941, included sediment control. One component of the plan was to construct 852 small check dams, 24 to 30 feet in height, in key channels, using reinforced concrete cribbing. The study used single regression analysis to relate the sediment yield of treated channels, for several years before treatment, to a norm. The treated channel was then related to the same norm to determine its post treatment performance to the amount of sediment expected without treatment. A second regression used annual runoff, in place of the norm, to analyze the influence of check dams. The conclusions of the study were: (1) There is a temporary reduction in the sediment yield to the basin during the time that the check dam system fills to mature debris cones. (2) Once the system is full, the sediment yield at the basin will return to normal, or perphaps slightly higher than normal. (3) The check dam systems do not influence the rate of sedimentation relative to runoff. (4) A burned watershed, or a major flood, can induce a treated channel to unload the temporary sediment storage in the system. This can be a small volume, or a catastrophic amount, depending on how many years have elapsed in which to store sediments. (5) The check dam systems can be breached by large boulders in major floods. (See also W77-00775) (Sims-ISWS)
W77-00801

SEDIMENT CONTROL AT IMPERIAL DAM,
Bureau of Reclamation, Yuma, Ariz. Yuma Projects Office.
T. H. Moser, and W. D. Sears.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 2-103 - 2-123, 1976. 4 fig, 1 tab, 10 ref.

Descriptors: *Sediment control, *Dams, *Colorado River, Sediments, Settling basins, Dredging, Suspended solids, Sediment load, Sediment transport, Sediment yield, Canals, Silts, *Arizona.
Identifiers: *Imperial Dam(Ariz), *Parker Dam(Ariz).

The construction of major dams and reservoirs on the Colorado River has reduced the chance of major floods and generally stabilized the river. However, along much of the lower Colorado River, channel and bank stabilization work is still required to reduce the sediment transport to a practical minimum within multi-purpose concepts for control and usage of the river facility. In the 238 kilometer (148 mile) meandering river channel from Parker Dam to Imperial Dam, sediment is continuing to be transported downstream in large quantities. The amount transported is largely contingent on the flow in the river and the degree of stabilization. Some reaches of the river have received stabilization treatment while other reaches have not. Since about 1963 water has been released from storage at Parker Dam only in the amount required for downstream irrigation and domestic uses and for scheduled deliveries of Treaty water to Mexico. As a result of these conditions, an annual average of about 726,000 metric tons (800,000 U.S. tons) of sediment have passed Imperial Dam in recent years. In addition, however, there has been a continued buildup of sediment in the reservoir. In the design of Imperial Dam, quite different sediment control facilities were provided for the two canal diversions. The All-American Canal desilting facilities consist of three double basins with 12 large rotating scrapers in each half basin. On the Gila Gravity Main Canal a flushing-type settling basin was used. Sediment from the control facilities is returned to the river below Imperial Dam where it is sluiced downstream to Laguna Settling Basin. At this location sediment is periodically removed by dredge. Dredging is also required periodically to keep a channel open to the Gila Canal headworks. (See also W77-00775) (Sims-ISWS)

DETERMINING EROSION FROM HAWAIIAN AGRICULTURAL LANDS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
G. W. Frasier, J. A. Replogle, K. R. Cooley, and S. A. El-Swaify.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 2-124 - 2-134, 1976. 2 fig, 2 tab, 13 ref.

Descriptors: *Soil erosion, *Sediments, *Hawaii, *Agricultural runoff, Watersheds(Basins), Agricultural watersheds, Agriculture, Farm management, Measurement, Instrumentation, Sampling, Suspended solids, Crops, Flumes, Sugarcane, Rainfall, Runoff, Sedimentation, Sediment control.
Identifiers: Pineapples.

Techniques, instrumentation, and preliminary results of studies to determine the natural rainfall runoff and associated soil erosion from six small watersheds within fields of sugarcane and pineapple in Hawaii were presented. The initial results indicated that with current cultural practices, rainfall runoff and soil erosion are negligible from fields with a crop cover, but may be significant from roads within the cropped area, and during and after harvest. Water management(Applied), Sediment load, Bed load, Aggradation, Fish, Wildlife, Wildlife management, Valleys, Marshes, Lakes, Settling basins, Recreation, Sedimentology, Arizona, California, Nevada.
Identifiers: *Lower Colorado River, *Mohave Valley(Ariz-Calif-Nev).

Sedimentation technology plays an important role in the Bureau of Reclamation's Lower Colorado River Management Program. Public demands also receive major consideration in the decision-making process. The experience of the Bureau of Reclamation in the Mohave Valley after construction of Parker Dam was discussed. Aggradation above Lake Havasu caused a critical situation near Needles, California, where railroad facilities and other developments were inundated or threatened by the rising river. This prompted passage of Federal legislation and authorized the Bureau of Reclamation to take the needed action. In its early stages, the river management program centered on reconstruction of the river channel by dredging and related work. It evolved by stages into a comprehensive program which now includes the improvement of the river and related features for fish and wildlife, general recreation, and other uses. The gathering of sediment and hydraulic data is an essential part of the overall program. Selected information from the data collection program was summarized to illustrate some of the changes brought about. The changing requirements in the Mohave Valley were discussed. Future management will be governed increasingly by publicly expressed environmental concerns. Methods of assuring appropriate input in program planning such as formation of the Lower Colorado River Management Program Coordinating Committee were described. (See also W77-00775) (Sims-ISWS)

THE ROLE OF SEDIMENT PROBLEMS IN HYDROELECTRIC DEVELOPMENT,
Federal Power Commission, Washington, D.C. Office of Energy Systems.
S. S. Fan.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 4-149 - 4-161, 1976. 10 ref.

Descriptors: *Sedimentation, *Reservoirs, *Rivers, *Dams, Sediments, Effects, Erosion, Suspended solids, Hydroelectric plants, Lake sediments, Water resources, Storage capacity, Silts, Sediment control, Sediment yield, Fish, Sedimentology.

When an artificial interference, such as a dam, is built on a graded river, the streamflow characteristics and the sediment carrying capacity of the river change. These modifications upset the equilibrium already established in that river. In turn, this unbalanced situation sometimes has a significant and unexpected impact on the environments in the vicinity of and, possibly, far away from the dam structure. This paper briefly defined the sedimentation problems involved and discussed the factors of concern in the design and planning of a hydroelectric project. Considerations from the engineering, environmental, and economic point of view were included. Also, deficiencies in the present technology and necessary research were discussed. SEDIMENTATION IN COON CREEK VALLEY, WISCONSIN,
California Univ., Los Angeles. Dept. of Geography.
S. W. Trimble.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 5-100 - 5-112, 1976. 7 fig, 4 tab, 4 ref.

Descriptors: *Sedimentation, *Deposition(Sediments), *Erosion, *Wisconsin, Watersheds(Basins), Valleys, Agriculture, Land use, Channel morphology, Bank erosion, Soil erosion, Surveys, Erosion control, Sediment control, Sedimentology.
Identifiers: *Coon Creek(Wis), Driftless area.

Coon Creek Valley is a severely eroded watershed in the driftless area of Wisconsin. Between c. 1850 and 1938, a net total of about 19,500 cu dkm (16,000 acre-ft) of sediment was deposited within the system, a rate of about 56 cu dkm/sq km (116 acre-ft/sq mi), or 0.7 cu dkm/sq km/yr (1.5 acre-ft/sq mi/yr) from the watershed exclusive of the main valley flood plains. These figures do not include colluvium or material transported from the system by streamflow. Recent studies concluded that between 1938 and 1974 sedimentation continued, but the total represents only about half the previous rate. Within the system, however, there continued a partial transfer of material with net export from tributaries and net deposition in the lower-gradient main valley. Within the past few years, there has been little deposition, and the present rate may be less than 10% of the high rates of the 1920's and 30's. This decrease was attributed primarily to changes of land use and land treatment. (See also W77-00775) (Sims-ISWS)

CHANNEL IMPROVEMENTS OF THE MISSOURI RIVER,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
E. V. Richardson, and H. Christian.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 5-113 - 5-124, 1976. 9 fig, 1 tab, 12 ref.

Descriptors: *Missouri River, *Channel improvement, *Sediment control, *Erosion control, Dams, Dikes, Structures, Braiding, Sediment discharge, Flow, Streamflow, Suspended solids, Deposition(Sediments), River beds, Particle size, Navigation, Flood control, Discharge(Water), Engineering, Rivers.
Identifiers: Channelization.

The lower Missouri River channelization is a classic example of engineers who worked with nature to change a liability to an asset. The Missouri was changed from an uncontrolled, sediment laden, unsightly, flooding, and eroding river to an orderly, well-behaved, clear and scenic river. The river was changed from an economic drain to an asset. The Missouri River is about 2500 miles long. At Sioux City, Iowa it has an average annual flow of 31,700 cfs (73 years of record). Prior to river development, the average annual sediment discharge was 164 million tons at Omaha, Nebraska (13 years of record). After development, average annual discharge decreased to 28 million tons (19 years of record). (See also W77-00775) (Sims-ISWS)

WIND EROSION OF SAND AND MEASURES FOR RECLAMATION IN THE ZONE OF THE KARA KUM CANAL, (IN RUSSIAN),
Desert Inst., Ashkhabad (USSR).
O. R. Kurbanov, and A. Arnalgel Dyev.
Probl Osvoeniya Pustyn 2, p 76-79, 1975.

Descriptors: *Wind erosion, *Sands, Canals, *Land reclamation, Erosion control.
Identifiers: *Turkmen-SSR, *Kara Kum Canal(USSR).

The Kara Kum Canal (Turkmen SSR, USSR) possesses a peculiar wind regime causing sand deflation in some areas. Annual sand movement has been directed southeastward, almost in a perpendicular manner to the Kara-Kum canal course. Therefore most reclamation work should be done on the right bank of the canal.–Copyright 1976, Biological Abstracts, Inc.

SIMPLE METHOD MEASURES SUSPENDED SOLIDS,
American Enka Co., Clemson, S.C.
D. F. Rich, J. R. VanSurdam, and P. Karr.
Water and Sewage Works, Vol. 123, No. 7, p 46-47, July, 1976. 3 ref.

Descriptors: *Analytical techniques, *Suspended solids, *Measurement, *Sampling, Equipment, Costs, Performance, Water quality control, Waste water treatment, *Pollution identification.

A simple method for estimating the amount of suspended solids in a clarifier is described which gives more accurate results than those obtained by the conventional method of multiplying the mixed liquor suspended solids concentration by the clarifier volume. The method involves lowering an open-ended plexiglass tube in the clarifier. When this tube reaches the clarifier bottom, a hinged stopper mounted on the bottom of the tube is pushed into the end of the plexiglass tube, thereby sealing it. The tube is then withdrawn from the clarifier and its contents dumped into a container and thoroughly mixed. Suspended solids determined on a sample taken from this container represent the average solids concentration in a vertical plane through the clarifier. Multiplying this concentration by the volume of the clarifier provides a better estimate of the amount of solids in the clarifier. A commercial sampler for employing the above technique has been built at a total cost of $38.00 which covers the tube assembly parts, mast, and hoist. (Kreager-FIRL)

APPLICATIONS OF AUTOMATIC EQUIPMENT TO WATER ANALYSIS,
D. G. Thomson.
Process Biochemistry, Vol. 11, No. 5, p 44-45, June 1976. 3 tab.

Descriptors: *Pollutant identification, *Analytical techniques, *Automation, *Monitoring, Phenols, Ammonium compounds, Phosphates, Nitrates, Nitrites, Chemical oxygen demand, Nitrogen, Ammonia, Chlorides, Silica, Equipment, *Water analysis.
Identifiers: Cyanide, Thiocyanate.

Advances in the automation of water analysis equipment are reviewed. An automatic analyzer capable of measuring thiocyanate, phenols, cyanide, ammonium ion, phosphate, and nitrate/nitrite is described along with its application to coke oven effluent monitoring. An automatic instrument for measuring chemical oxygen demand involves the use of an aluminum heating block which can be programmed by the operator. A self-contained series of reflux heads fits directly onto the system, thus allowing the simultaneous digestion of up to 20 samples over an exactly timed and temperature controlled interval. The digested sample is then transferred to sample cups where chemical oxygen demand is determined automatically. An automatic analyzer capable of measuring nitrite, total organic nitrogen, phosphate, ammonia, chloride, and silica is also described. The instrument is capable of handling 60 samples/hour and has the capacity for up to 12 channels. (Kreager-FIRL)

MULTIELEMENT AND CHLORINATED HYDROCARBON ANALYSIS OF MUNICIPAL SEWAGE SLUDGES OF AMERICAN CITIES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Nuclear Reactor Lab.
A. K. Furr, A. W. Lawrence, S. S. C. Tong, M. C. Grandolfo, and R. A. Hofstader.
Environmental Science and Technology, Vol. 10, No. 7, p 683-687, July 1976. 2 tab, 32 ref.

Descriptors: *Sewage sludge, *Pollutant identification, *Dieldrin, *Polychlorinated biphenyls, *Trace elements, Cities, Surveys, Fluorine, Gold, Mercury, Copper, Lead, Nickel, Zinc, Municipal wastes.
Identifiers: Barium, Antimony, *Chlorinated hydrocarbons.

Data from an analytical survey of 68 elements, dieldrin, and polychlorinated biphenyls conducted on municipal sewage sludges sampled during 1972-1973 from 16 American cities are reported. Fluorine levels were high for several cities which fluoridate their water. The level of polychlorinated biphenyls was highest for Schenectady, New York and was possibly the result of wastes generated by a predominant manufacture of electrical equipment in the city. Levels of gold were especially high in Miami and San Francisco sludges. Mercury was also high in these same two sludges. The high levels of both metals may be due to geochemical sources. A number of elements were notably high in sludges from other specific cities. These included: antimony, copper, and lead (Philadelphia); nickel (Denver, Los Angeles, Miami, Milwaukee, and Philadelphia); barium (Ithaca and Los Angeles); and zinc (Los Angeles and Philadelphia). INSTRUMENTATION IN THE WATER INDUSTRY.
Water Services, Vol. 80, No. 964, p 370, 372, June, 1976.

Descriptors: *Flow measurement, *Monitoring, *Effluents, *Weirs, Hydraulic structures, Flow, Engineering structures, Analytical techniques, Liquid wastes, Flow rates, *Instrumentation.

A technique for measuring and recording effluent flow is described. The technique employs a vee-notch weir tank in the effluent channel in which the head of liquid over the weir has a known relationship to the rate of flow. A dip-tube fed with compressed air in the tank converts the head of liquid into a pressure which is fed to a suitably calibrated liquid flow recorder. If it is not practicable to fit a weir tank, the recorder can be used in conjunction with a venturi flume. The use of a vee-notch weir plate is preferred because it has the advantage that the shape of the issuing jet is geometrically similar at all heads. This makes it possible to use a standard scale shape for the recorder and gives interchangeability of chart ranges. As in all weir plate measurements, the liquid should be practically motionless apart from the movement of particles towards the notch. In practice this is achieved by fitting the weir plate in the side or end of a tank at a point remote from the notch. (Kreiger-FIRL)

VARIABLE NATURE OF CHEMICAL COMPOSITION OF SEWAGE SLUDGES,
Purdue Univ., Lafayette, Ind. Inst. of Environmental Health; and Purdue Univ., Lafayette, Ind. Agricultural Experimental Station.
L. E. Sommers, D. W. Nelson, and K. J. Yost.
Journal of Environmental Quality, Vol. 5, No. 3, p 303-306, July-September, 1976. 6 tab, 11 ref.

Descriptors: *Pollution identification, *Sewage sludge, *Chemical analysis, *Municipal wastes, *Chemical properties, Indiana, Cities, Carbon, Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Iron, Cadmium, Zinc, Copper, Nickel, Lead, Sludge disposal, Organic compounds, Inorganic compounds.

Sewage sludge samples were collected over a year period from eight Indiana cities and we analyzed for carbon, nitrogen, phosphorus, pota sium, calcium, magnesium, ironn, cadmium, zin copper, nickel, and lead. The sludges contain approximately 50% organic matter and 1-4% in ganic carbon. Organic and inorganic carbon, ganic nitrogen, inorganic phosphorus, calciu and magnesium were present in a given sludge a relatively constant concentration with respect sampling time. Inorganic nitrogen, orga phosphorus, potassium, and all metals were fou to be quite variable with time for sewage slud produced by a given city. In general, orga nitrogen and inorganic phosphorus constituted t majority of total nitrogen and phosphorus, resp tively, in sludges. The largest deviations betwe the mean and median were found for cadmiu zinc, copper, nickel, and lead. The variable natu of inorganic nitrogen and metals in sludges dicates that a sound sampling and analysis p gram is essential prior to formulating recomme dations for rates of sewage sludge application soils used for crop production. (Kreager-FIRL)

COMPLEXATION OF TRACE METALS ETHYLENEDIAMINETETRAACETIC AC (EDTA) IN NATURAL WATERS,
Water Pollution Research Lab., Stevena (England).
J. Gardiner.
Water Research, Vol 10, No 6, p 507-514, 1976 fig, 4 tab, 33 ref.

Descriptors: *Chelation, *Organic acids, *Meta *Sewage, Surface waters, Chemical analys Mathematical studies, Domestic wastes, Wa pollution effects, Fish, Algae, Calcium, Ions, To icity, Detergents.
Identifiers: Complexation, Metal organic co plexes, Ethylenediaminetetraacetic acid.

Concentrations of the chelating ag ethylenediaminetetraacetic acid in detergents, p mary and secondary sewage, and river water w determined, and a method for calculating the tent of complexation of trace metals by the chel ing agent in the presence of calcium and oth complexing agents was develop Ethylenediaminetetraacetic acid was present at average concentration of 170 micrograms/liter domestic sewage and at higher concentrations sewage containing industrial effluents. Calcu tions revealed that despite the competitive eff of calcium in hard wat ethylenediaminetetraacetic acid at the concent tions found in sewage and river water is sufficie in most cases to complex most of the import trace metals to a considerable extent. The t dency of ethylenediaminetetraacetic acid to ke metal ions in solution could lead to increased tra metal mobility in water courses and a reduced r of removal of trace metals by adsorption a precipitation in lakes and reservoirs. Chelati agents may also be a factor in stimulating al growth and in reducing the toxicity of trace met to fish. Insufficient information exists to establi the net effect of ethylenediaminetetraacetic a on the aquatic environment, however. (Kreag FIRL)

PRECISION AQUARATOR SPEEDS C DETERMINATION,
T. Viraraghavan.
Water and Sewage Works, Vol. 123, No. 8, p 81, August, 1976. 3 fig, 1 tab, 3 ref.

Descriptors: *Chemical oxygen dema *Analytical techniques, *Pollutant identificati *Spectroscopy, *Oxidation, Instrumentation, C bon dioxide, Chemical reactions.
Identifiers: Nondispersive infrared analysis.

A device which produces rapid and reliable chemical oxygen demand detrminations is described that works on the combustion-infrared principle. A 20-microliter sample (homogenized in a Waring blender) is injected by syringe into the instrument. The sample is swept through a platinum catalytic combustion furnace by a stream of dry carbon dioxide which oxidizes the pollutants to carbon monoxide and water. The water is stripped out in a drying tube, and the reaction products are then passed through a second platinum catalytic treatment. The carbon monoxide concentration is then measured by an integral nondispersive infrared analyzer, and the resultant reading is directly converted to chemical oxygen demand by the use of a calibration curve. The method is best suited for oxygen demands in the range of 50-300 milligrams/liter, although operation down to 10 milligrams/liter is feasible. (Kreager-FIRL)

DEVELOPMENT OF WATER QUALITY SAMPLING PROGRAMS,
Hydrocomp, Inc., Palo Alto, Calif.
R. G. Bourne.
Simulation Network Newsletter, Vol. 8, No. 2, p 5-8, March 1976. 2 fig, 1 tab.

Descriptors: *Analytical techniques, *Water quality, *Water sampling, Programs, *Data collections, Model studies, Analysis, Planning, Sampling.

Procedures are described which should be followed in developing a sampling program that provides data not only characteristic of water quality within the system but also that meet requirements necessary for use by the selected model. A study for the Central Midlands Regional Planning council (CMRPC) is used to illustrate the development of such a sampling program. The scope of the sampling program is defined by the overall goals and objectives of a water quality study. Awareness of model requirements is also essential to the development of a sampling program which provides homogeneous data series acceptable to the model. Data which are not representative of temporal and spatial variations in the system have little value. The first step in designing a water quality sampling program is determining the goals and objectives of the water quality study. The sampling program should then be designed as a function of the goals and objectives. The model which is best suited to providing the necessary analyses required to meet the goals and objectives of the study should then be selected. The sampling program should then be re-examined and altered if necessary to assure that the input requirements of the model will be satisfied by the data. (Snyder-FIRL)

HYDROGEN SULFIDE IN BOTTOM WATER NEAR A SEWAGE SLUDGE DUMPING SITE,
Brookhaven National Lab., Upton, N.Y. Dept. of Applied Science.
F. W. Barvenik, F. B. Hill, V. P. Aneja, and R. M. Felder.
Technical Report BNL 20778, October, 1975. 27 p, 5 fig, 3 tab, 30 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Hydrogen sulfide, Aquatic environment, *Seawater, Sewage sludge, Sludge disposal, Gas chromatography, On-site investigations, New York.
Identifiers: Reduced sulfur compounds, Disposal sites, *New York Bight.

An attempt was made to determine the concentrations of reduced sulfur compounds in bottom water in the vicinity of a sewage sludge dumping site in the apex of the New York Bight and to determine the utility of a field-adapted gas chromatographic system as an analytical tool for such a study. The study site was in the center of a depression which tends to collect sludge sediments; the water depth at the site is about 33 to 34 m. Water from 2 m above the bottom was pumped on board the research ship and then through a gas-liquid contactor. Volatile compounds transferred to the gas phase were passed to the gas chromatograph. The gas chromatographic technique used permits the detection of the entire spectrum of volatile sulfur compounds and, at least for hydrogen sulfide, is considerably more sensitive than the usual wet chemical methods. Although significant peaks were found for hydrogen sulfide, peaks for other sulfur compounds were not clearly evident. Assuming an equilibrium distribution of hydrogen sulfide between gas and liquid phases in the contactor, the concentration of total sulfide dissolved in the bottom water was estimated at 0.03-0.08 microM. The bottom water was partially depleted of dissolved oxygen and contained a small population of sulfate reducers (Desulfovigrio desulfuricans). (Snyder-FIRL)

Descriptors: *Waste water treatment, *Pollutant identification, *Analytical techniques, *Treatment facilities, Mathematics, Effluents, Measurement, Microbiology, Engineering education, Volumetric analysis, Laboratory equipment, Education, Chemicals, Sanitary engineers, Bacteria, *Monitoring.

This Basic Laboratory Skills course is designed for treatment plant operators or technicians who must monitor effluent discharges under a National Pollutant Discharge Elimination System (NPDES) permit and who have little prior laboratory experience. The instructor's manual contains all the instructional package worksheets for presenting the course. The mathematical material includes whole numbers, decimals, the metric system, percentage, and formulas. The chemical laboratory material contains such applications as weighing, techniques, laboratory equipment use, and preparing and standardizing reagents. Basic microbiological techniques are also introduced. (Snyder-FIRL)

MAINTENANCE MANUAL: INSTRUCTIONS FOR SENSOR CLEANING AND FIELD CALIBRATION. THE POTOMAC RIVER WATER POLLUTION MONITORING SYSTEM,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Div. of Pollution Surveillance.
A. F. Mentink.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 783, Price codes: A03 in paper copy, A01 in microfiche. September, 1966. 31 p, 3 append.

Descriptors: *Pollutant identification, *Analytical techniques, *On-site data collections, *Automation, *Automatic control, Water quality, *Maintenance, *Instrumentation.

A very important, but underemphasized, aspect of automatic acquisition systems for water quality data is maintenance of field instrumentation. The sensitivity of the electrodes decreases as contaminants accumulate on them. The more rigorous and disciplined the program of maintenance, the higher the probability of getting useful and valid data. Instructions for first-level maintenance (sensor cleaning and field calibration) are covered. The parametric systems discussed include pH, conductivity, dissolved chlorides, dissolved oxygen, oxidation-reduction potential, solar radiation intensity, and temperature. (Snyder-FIRL)

A SIMPLE TUBE-TYPE WATER PROFILE SAMPLER,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. G. Gilbert, and J. B. Miller.
Water Resources Research, Vol. 12, No. 4, p 812-815, August 1976. 1 fig, 3 tab, 5 ref.

Descriptors: *Instrumentation, *Sampling, *Plastics, Farm ponds, Irrigation canals, Lakes, Ponds, Dissolved oxygen analyzers, Chemical analysis, Tubes, Water sampling, Agriculture, Pollutant identification.
Identifiers: *Water profile sampler, *Plexiglass sampler, Recreational lakes, Dissolved oxygen profiles, Biological analysis, Tube-type sampler, Surface water sampling.

A plexiglass tube-type water profile sampler was designed for use in relatively shallow bodies of water, such as farm ponds, small recreational lakes, irrigation canals, and the surface 2 m of larger lakes and rivers. The sampler was a plexiglass tube with holes drilled at intervals (side ports) corresponding to water layers which were to be sampled. To obtain a water sample, the tube (open at both ends and with the side ports closed) was gently lowered vertically into the water. With the top stoppered, the tube was raised and its bottom stoppered just under the water surface. While the tube was held vertically, the water profile samples were rapidly and easily obtained after removing the top stopper and successively collecting from top to bottom the water sample from each side port. Dissolved oxygen (DO) profiles of the ponds measured with an oxygen probe directly in the ponds were similar to DO profiles of water samples collected with the tube sampler. Chemical and biological analyses of water samples obtained with the tube-type sampler and two other standard type water samplers (Kemmerer and Van Dorn) were compared. The analyses revealed that similar relative results were obtained from water samples collected with all three samplers, but the tube-type sampler was more desirable for obtaining water profile samples because of its simplicity of design and operation especially in small ponds. (Roberts-ISWS)

MANGANESE IN NARRAGANSETT BAY,
Rhode Island Univ. Kingston. Graduate School of Oceanography.
W. F. Graham, M. L. Bender, and G. P. Klinkhammer.
Limnology and Oceanography, Vol. 21, No. 5, p 665-673, September 1976. 5 fig, 5 tab, 22 ref. EPA R803243-01-0.

Descriptors: *Manganese, *Bays, *Sampling, Saline water-freshwater interfaces, Aluminum, Hydrogen ion concentration, Estuaries, Rivers, Sediments, Chemicals, Chemical precipitation, Adsorption, Metals, Suspended solids, Dissolved solids, Chemical analysis, Analytical techniques, Benthos, Pollutants, *Pollutant identification.
Identifiers: *Narragansett Bay(RI), Desorption.

Concentrations of dissolved manganese and particulate manganese and aluminum were determined in samples from Narragansett Bay, Rhode Island, and its surrounding rivers. Total manganese was approximately conservative, but dissolved and particulate manganese were not.

Desorption may occur in the tidal rivers at low salinities. Most riverine manganese was dissolved, but manganese in the bay was predominantly particulate, probably due to rapid manganese oxidation at bay water pH. The flux of dissolved manganese into bottom waters was about 2 + or - 1 micrograms/sq cm per day. Concentrations in bottom waters were high relative to surface waters. (Sims-ISWS)

ALIPHATIC HYDROCARBONS IN SEDIMENTS OF LAKE WASHINGTON,
Washington Univ., Seattle. Dept. of Chemistry.
S. G. Wakeham, and R. Carpenter.
Limnology and Oceanography, Vol. 21, No. 5, p 711-723, September 1976. 4 fig, 2 tab, 56 ref. ERDA E45-12225TA40.

Descriptors: *Sediments, *Organic compounds, *Oil, Pollutant identification, Chemical analysis, Gas chromatography, Sampling, Surveys, Analytical techniques, Lakes, Aging(Physical), Chemicals, Pollutants, *Lake sediments.
Identifiers: *Lake Washington(Wash), *Aliphatic hydrocarbons, Paraffins, Petroleum hydrocarbons, Radiocarbon dating.

The distribution of aliphatic hydrocarbons in sediments from several locations in Lake Washington was determined by gas chromatographic, radiocarbon, and stable carbon isotope analyses. Most surface sediments contained an average of about 1400 microgram/gram dry wt total aliphatic hydrocarbons, of which about 10 microgram/gram were n-paraffins. Gas chromatograms of these hydrocarbons and radiocarbon ages of about 18,000 years B.P. for the aliphatic hydrocarbon fraction suggested the presence of a large component of petroleum hydrocarbons. By contrast, sediments at depth in the sediment column and deposited before about 1880 contained only about 30 microgram/gram total aliphatics and about 5 microgram/gram n-paraffins. These hydrocarbon levels were believed to represent the aged natural background concentrations in Lake Washington. A number of cores analyzed in detail showed an increase in hydrocarbon levels after 1880, which corresponded to the start of a period of growth for the adjacent metropolitan area. (Sims-ISWS)

An algal assay capable of detecting the carrying capacity of nutrient-poor rivers was developed. Two problems were eliminated. The first involved culture and preparation of test algal strains. When cells were inoculated into river water samples, growth was supported by nutrients in the sample and these carried-over intracellularly by the inoculum, inaccurately measuring growth. This was especially pronounced in nutrient-poor waters. The second problem concerned inoculum size. Nutrient-rich waters can support larger algal populations than normally found. With nutrient-poor waters and small inocula, time may be spent waiting for sufficient growth to occur to allow quantitation. If the inoculum is heavy, quantitation occurs after short-growth periods, but may overload carrying capacities of nutrient-poor samples, inaccurately indicating their ability to support indigenous flora growth. To eliminate nutrient carryover, growth medium was developed containing less than 4 mg/l total inorganic salts. The test organism, Selenastrum capricornutum (10,000 cells/l) was grown in sterile-filtered river water and transferred daily. Low initial cell numbers permitted more nutrients/cell. Daily transfer exposed samples to greater nutrient differences and provided greater sensitivity. After incubating a week, cells were counted and doublings/day determined. The method is a simple, precise, inexpensive, short-term test useful in studying freshwaters. (Buchanan-Davidson—Wisconsin)

RAMS SURFACE AND DRINKING WATER OMPONENTS, JANUARY--MARCH 1974.
ffice of Radiation Programs, Las Vegas, Nev.
Radiation Data and Reports, Vol 15, No 8, p 502-05 Aug 1974. 4 p, 2 fig, 3 tab, 1 ref.

Descriptors: *Water sampling, *Surface waters, *Potable water, *Radioactivity, *Administrative agencies, Gamma rays, Nuclear wastes, Public health, Radiation, Water pollution effects, Human population, Environmental effects, Analysis, Radioactivity effects, Tritium.
Identifiers: *Radiation data, Environmental radiation ambient monitoring system.

The Environmental Radiation Ambient Monitoring System (ERAMS) began in 1973. It was developed from previously operating monitoring networks to form a single system more responsive to current and projected sources of environmental radiation. The ERAMS Surface and Drinking Water Components consists of 76 drinking water samples taken quarterly from major population centers and selected nuclear facility environs. The radiation data thus assembled include analyses of: (1) tritium on a quarterly basis; (2) gamma scan, gross alpha and beta radioactive measurements annually; and (3) an annual composite for plutonium 238 and 239. The Surface Water Component consists of 55 quarterly surface water samples taken downstream from nuclear facilities or at background stations. A table presents the tritium concentrations in drinking water at selected stations for January-March 1974. Also examined here are the methods by which radiation doses may be determined and the various formulas utilized. (Lauer-Florida)

RADIOACTIVITY IN KANSAS SURFACE WATERS, JANUARY--DECEMBER 1972.
Kansas State Board of Health, Topeka. Radiation Control Section.
Radiation Data and Reports, Vol 15, No 8, p 500-01 Aug 1974. 2 p, 1 fig 1 tab.

Descriptors: *Data collections, *Kansas, *Surface waters, *Radioactivity, *Administrative agencies, Public health, Recreation, Missouri River, Nuclear wastes, Radiation, Nuclear reactors, Gamma rays, Sewage disposal, Water pollution effects, Water sampling, Industrial wastes.
Identifiers: *Radionuclides, Radiation data.

Monitoring the levels of radioactivity in Kansas surface waters is important since both present and future potential use for domestic, recreational, and industrial purposes may be effected. The Radiation Control Section of the Kansas State Department of Health collects liter samples every month at designated locations. The samples are then analyzed for gross alpha and beta radioactivity and scanned for specific radionuclides. The report discusses the analytical procedures used and illustrates the gross alpha and beta radioactivity in Kansas surface waters through one figure and two graphs. The report further states that radioactivity in the surface waters may consist of natural radioactivity picked up by flowing streams, radioactivity from sewage discharge, contributions from industrial sources, and fallout. (Lauer-Florida)

OF PCB PPMS FROM GE AND A SNAFU FROM EPA AND DEC,
R. Boyle.
Audobon, Vol 77, p 127-33, November 1975. 7 p.
Descriptors: *Polychlorinated biphenyls, *Aroclors, *DDT, *Chlorinated hydrocarbon pesticides, *Pollutants, Water pollution, Water pollution sources, Industrial wastes, Industrial production, Chemical wastes, Chemicals, Chemical industry, Wastes, Water quality, Fish, Water pollution effects, Water quality standards.

PCB's, or polycholorinated biphenyls, have been shown to produce adverse effects when taken into the human body through the food chain. Studies in Japan have produced evidence of severe acne, cheeselike discharges from the eyes, skin darkening, hearing loss, and other nuerological disorders. In addition, a number of newborn infants had abnormal skin pigmentation, still births were above the national average, and the majority of fetuses studied were smaller than the national standard. As a result of this study, Japan has banned the chemical. PCB's continue to be used in the United States, however, in adhesives for envelopes and tapes, waterproofing of canvas, plastic bottles, caulking compounds, and numerous other products and processes. At the present time abnormally high amounts of PCB's are being dumped into the Hudson River by General Electric. Efforts to reduce or halt their use have not been overly successful. Hudson River bass and Lake Ontario salmon have since been declared nonedible by the New York Department of Environmental Conservation. Such adverse effects have not been unusual. For example, the shrimp and oyster business was seriously damaged in Northwest Florida waters by high levels of PCB's released by a large textile industry. To prevent such adverse effects in the future, conservation groups are attempting to stop the introduction of PCB's into public waterways. (Frank-Florida)

A POLAROGRAPHIC METHOD FOR THE DETERMINATION OF METALS IN WASTE WATERS, (IN ITALIAN),
Florence Univ. (Italy). Inst. of Chemical Analysis.
G. Piccardi, P. Cellini, and Legittimo.
Ann Chim 64(1/2); p 1-6, 1974.

Descriptors: *Pollutant identification, *Polographic analysis, *Metals, Analytical techniques, Sewage, Water pollution.

A polarographic method for the qualitative and quantitative determination of some metals in foul waters and sewage waters is proposed and discussed. The organic substances, after the evaporation of the sample, are destroyed by a slow digestion with nitric and perchloric acid; to the residue a volume of water containing the supporting electrolyte, 10 times smaller than that of original sample, is added. By this way concentrations below 0.1 mg/l in the original sample may be determined.--Copyright 1976, Biological Abstracts, Inc.

ENZYMATIC IN SITU MEASUREMENTS: NEW SEAWATER AND SEDIMENT MEASUREMENT METHODS, (IN GERMAN),
Kiel Univ. (West Germany). Institut fuer Meereskude.
T. Gradl.
Kiel Meeresforsch 30(1), p 1-11, 1974.

Descriptors: *Enzymes, Metabolism, Sediments, Measurement, Bacteria, *Electrodes, Phosphorus, Ureas, Ammonia, Color, Sea water, Pollutant identification.
Identifiers: Dehydrogenase, Electode, Enzymatic measurement.

A percolator was constructed to continuously measure metabolic processes in sediments. A continuous flow of water penetrates the sediment. O2 can be excluded. Continuous polarographic control or control with enzyme electrodes is possible. Gases evolved by metabolism can be trapped. An attempt to discriminate bacterial and purely enzymatic processes (free enzymes) by addition of chloroform or toluence (both lethal for bacteria) was unsuccessful. Enzyme electrodes were constructed as a probe for sediments, for the percolator and for the free water. The enzyme electrodes permit the determination of the ratios of Pi/organic P, urea/ammonia, and glycosidically bound glucose/free glucose. The enzyme is coupled to a diazotized anilin resin fixed on a metal electrode as a thin layer. The potentials (measured against Ag-AgCl) correlate with the ratio of the concentrations of substrate and product. Absolute measurements can be performed. The electrodes are calibrated in Tris-HCl-buffer solutions of pH S. To study the fine strucure of sediments, matrix bound color reactions are used. The matrices are fixed to glass slides. Glucose is bound glycosidically to an epoxy resin. After exposition the remaining glucose is measured by a color reaction. Dehydrogenases are detected by 2, 3, 5-triphenyltetrazolim-chloride fixed to a matrix by sprying with a teflon aerosol. The yellow formazan color is measure. H2S is detected by lead acetate which is enclosed in the cells of a dried emulsion. The walls are permeable for gas (H2S), but not for the insoluble reaction product. All reactions are calibrated in Tris-HCl-buffer solutions of pH 8.--Copyright 1976, Biological Abstracts, Inc.

DEVELOPMENT OF A SYSTEM TO DETECT AND MONITOR SEDIMENT POLLUTION,
Rhode Island Univ., Kingston. Dept. of Civil and Ocean Engineering.
V. A. Nacci.
Available from the National Technical Information Service, Springfield VA 22161, as PB-259 265, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1976). 19 p, 5 fig, 3 tab, 11 ref. OWRT A-055-RI(1). 14-34-0001-5040.

Descriptors: Soils, *Resistivity, Metals, Sediments, Trace elements, *Monitoring, Pollutant identification, *Sediment distribution, Cores, Sampling, Path of pollutants, *Rhode Island.
Identifiers: *Sediment pollution(Offshore), *Narragansett Bay(RI).

A system to monitor sediment pollution is presented. A modified electrical resistivity device was used to study laboratory and offshore sediment pollution. In the laboratory, several different soil type saturated in a simulated sea water with without different pollutants, including soap, fert izer, pesticide, paint, and fuel oil were used for i vestigation. The laboratory study results indicat that the presence of the pollutants resulted in considerable change in the electrical resistivity the sediment. A field electrical resistivity stu gave sediment pollution distribution in good agre ment with that obtained from laboratory analy of core samples. Results indicated that the elect cal resistivity device can provide a quick a economical way of monitoring pollution in mari sediments.

ON RADIOACTIVE WASTE MANAGEMEN AN ANALYSIS OF THE PARAMETERS CO TROLLING SUBSURFACE CONTAMINAN TRANSFER,
Alberta Univ., Edmonton. Dept. of Geology.
F. W. Schwartz.
Journal of Hydrology, Vol. 27, p 51-71, 1975. 9 f 12 equ, 15 ref.

Descriptors: *Radioactivity, *Radioactivity fects, *Model studies, Soil water movem *Path of pollutants, Soils, Water polluti sources.
Identifiers: *Radioactivity transfer.

The problem of subsurface, radioactive-contan nant transfer is investigated theoretically throu the development of a two-dimensional mo which considers the simultaneous flow of wa and mass. In addition to the well-known physi transport processes, convection and dispersi the model treats radioactive decay and cati exchange which are two of the most import concentration attenuation processes. The fluence of factors, which control the transp processes, on subsurface contaminant distri tions is demonstrated through the simulation a analysis of a series of hypothetical cases. W respect to the physical transport process hydraulic conductivity, porous medium dispersi ty and the location of the contaminant inflow zo are considered as controlling paramet (Skogerboe-Colo St)

PHYSICAL FUNDAMENTALS OF THE MIXI OF SOLUTIONS OF POLLUTANTS A SEWAGE IN POROUS MEDIA,
Gesellschaft fuer Strahlen- und Umweltforschu m.b.h., Neuherberg bei Munich (West German Institut fuer Radiohydrometrie.
D. Klotz.
Water Research Vol. 9, No. 12, p 783-7 December 1975. 15 fig, 1 tab, 18 ref.

Descriptors: *Water quality, *Groundwater, P lution, *Porous media, Sewage, Diffusi Aquifer characteristics, *Mixing, *Path of pol tants.

The increasing danger of ground-water polluti by pollutants from the environment and by creasing amounts of sewage requires an exami tion of the mechanisms of distribution and tra

ort within the water-bearing stratum. Two mixing rocesses occur in the simultaneous propagation f two miscible liquids in a porous medium (water-earing stratum): hydrodynamic dispersion and olecular diffusion. If a region of flow is marked n a liquid (ground-water) flowing through a orous medium with a further liquid (solution of ollutants, sewage) being miscible therewith, this arked region increases as regards its extension uring the joint movement of the two liquids. A ixing of the 'marking substance' with the flowing iquid occurs, the decrease in concentration of the marking substance' being a measure for the egree of intermixture. (Skogerboe-Colo St)

URBAN SEDIMENT PROBLEMS: A STATEMENT ON SCOPE, RESEARCH, LEGISLATION, AND EDUCATION.
American Society of Civil Engineers, New York. Task Committee on Urban Sedimentation Problems.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol. 101, No. HY4, p 329-340, April 1975. 1 tab, 7 ref.

Descriptors: *Sediments, *Sedimentation, Sediment control, Urban runoff, Urbanization.
Identifiers: *Urban sediments.

Present (1974) erosion control guidelines and echnology indicate that: There are sufficient and varied erosion control guidelines available for use as models for local governments. Past implementation experience can provide valuable information o new programs and help avoid many initial roblems. Evaluation of social and physical damages still remains a weak point in economic analyses of control systems. Existing technology s adequate to design urban erosion control systems; however, design criteria developed for agricultural areas should be reviewed for adequacy in each case until sufficient experience in urban areas is documented and evaluated. Guideline handbooks are meant to provide general locaal information and should not be used arbitrarily as final design manuals. Erosion control systems do not have to be 100% effective in reducing soil loss o be acceptable. Needed research for more useful erosion and sediment control should be focused in two general areas: on improving the application of rurally developed technology to the urban situation and on developing methods and criteria for evaluating social and physical costs of various control systems relative to alternative costs of allowing specific amounts of sediment into specific water bodies. (Skogerboe-Colo St)

MIGRATION OF SALT FROM FEEDLOT WASTE AS AFFECTED BY MOISTURE REGIME AND AGGREGATE SIZE,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
A. Amoozegar-Fard, W. H. Fuller, and A. W. Warrick.
Journal of Environmental Quality, Vol. 4 No. 4 p 468-472 October-December 1975. 2 fig, 6 tab, 14 ref.

Descriptors: *Salinity, *Return flow, *Feed lots, Water management, Water quality control, Soil moisture, *Farm wastes, Waste disposal, *Electrical conductance, Conductivity.
Identifiers: *Manure disposal.

The migration of salt from three different aggregate sizes of feedlot manure under three moisture regimes was evaluated. The three sizes were small (to pass a 40-mesh sieve), medium (0.9 cm in diameter, 2.25 cm in length), and large (4.8 cm in diameter, 2.6 cm in length). The three moisture regimes were: (1) 12 hours saturation, 12 hours drainage by gravity, this step was repeated five times; (2) 12 hours saturation, 12 hours drainage by gravity, 48 hours oven drying at 60C, also repeated five times; and (3) continuous leaching for 60 hours at a constant rate. After each 12 hour saturation period the leachates were collected and the electrical conductivity (EC), pH, and concentrations of K, Na, Ca, Mg, NH4, NO3, C1, S, P, and eight trace elements determined. The EC of the leachate for the first saturation period was highest for the small-sized aggregates under all three moisture regimes (21. 3, 21.2, and 19.3 mmhos/cm, respectively) and the lowest for the large-sized aggregates under continuous leaching (8.3 mmhos/cm). During the later leaching periods, the EC of the leachate for the large aggregates was higher than the other two sizes. Continuous leaching resulted in a lower EC for the first and a greater EC for the later saturation periods compared to the other two treatments. As for the individual salts, the migration pattern for K, Na, S, and C1 was similar to that for EC, however, the pattern for the other ions was dissimilar. (Skogerboe-Colorado State)

MUNICIPAL WATERSHED MANAGEMENT SURVEY,
Southeastern Area State and Private Forestry, Atlanta, Ga.; and Geological Survey, Atlanta, Ga.
C. E. Dissmeyer, and W. T. Swank.
American Water Works Association Journal, Vol. 68, No. 2, p 97-100, February, 1976. 10 tab, 5 ref.

Descriptors: *Watershed management, *Land use, *Water quality, *Forest management, Streamflow, *Southeast US, Recreation facilities, Information exchange, Municipal wastes, Surface waters, Surveys, *Forest watersheds.

A general summary of survey data on the nature and extent of land uses, management problems, and information needs for municipal watersheds in the southeastern United States is presented, with particular emphasis on small and heavily forested watersheds.Currently, more than half of the small forested watersheds are either totally or partially closed to use. On the remaining watershed that are open, recreational activities are predominant, with some timber-management activities also being conducted. Major problem areas in watershed management include water quality problems and problems associated with water quantity and seasonal distribution of streamflow. The first problem was reported by 41% of the watershed managers surveyed, and the latter two problems were reported by 22% and 28%, respectively, of the managers surveyed. Information on the effects of forest management activities on the quantity and timing of streamflow does not appear to be reaching water supply managers despite its availability. Additional research is needed to more clearly define the impact of forest practices on water quality. (Kreager-FIRL)

WATER TEMPERATURE SIMULATION,
Hydrocomp, Inc., Palo Alto, Calif.
G. T. Lum.
Simulation Network Newsletter, Vol. 8, No. 3, 8 p, May, 1976. 5 fig, 2 tab.

Descriptors: *Simulation analysis, *Water temperature, *Heat transfer, *Water pollution effects, Rivers, Model studies, *Columbia River, Mathematical models, Advection, Methodology, Nuclear power plants.

The methodology of water temperature simulation is reviewed and applied to a case study. Simulation of water temperature is based on the use of an artificial control volume. Changes in the heat content of the control volume are due to internal sources, internal sinks, or transport of the heat across control volume boundaries. The general methodology is to evaluate each individual effect, then sum the effects to arrive at the net overall change in heat content of the control volume. Temperature simulation of river systems is greatly simplified by the absence of internal sources and sinks of heat. Changes in the heat content are due only to the transport process of advection, diffusion and dispersion, and heat transfer across the water surface. The representation of advected heat is easily done if the model contains flow-routing procedures. The accurate representation of diffusion and dispersion involves several complications; however, these two parameters can be assumed negligible relative to advection. Transport of heat across the air-water interface involves a number of different mechanisms which cannot be predicted adequately. The usefulness of water temperature simulation is illustrated by evaluating the effects of a proposed nuclear power plant on the downstream thermal regime of the Columbia River System. (Kreager-FIRL)
W77-00616

THE NONPOINT SOURCE POLLUTANT LOADING (NPS) MODEL,
Hydrocomp, Inc., Palo Alto, Calif.
Y. J. Litwin, and A. S. Sonigian, Jr.
Simulation Network Newsletter, Vol. 8, No. 4, 4 p, July 1976. 4 fig, 4 ref.

Descriptors: *Computer models, *Overland flow, *Water pollution sources, *Simulation analysis, Surface runoff, Urban runoff, Surface waters, Model studies, Watershed management, Waste loading.
Identifiers: *Nonpoint pollution sources.

A computerized model for simulating nonpoint source pollutant loading is described. The model continuously simulates the hydrologic processes, including pollutant accumulation, generation, and washoff from the land surface as well as snow accumulation and melt. The model is limited in the sense that only land surface contributions to nonpoint source pollution are evaluated. Subsurface and groundwater pollutants as well as channel processes are not considered. The model is concerned with the total loading or pollutant input to a stream channel or waterbody from the land surface; for water quality evaluations in watersheds where in-stream processes are significant, the model must be interfaced with stream water quality models. Sample results of simulating overland flow quantity and quality for an urban watershed are presented and indicate that the model provides a viable means for assessing land surface contributions of nonpoint pollutants. Calibration of certain model parameters is a necessary and critical step when applying the model to a particular watershed since the model is limited by simplifications due to incomplete descriptions of the processes controlling nonpoint pollution. NITROGEN TRANSFORMATIONS OF AMMONIUM SULFATE AND ALANINE IN SUBMERGED MAAHAS CLAY,
Philippines Univ., College. Coll. of Agriculture.
I. J. Manguiat, and T. Yoshida.
Soil Sci Plant Nutr. 19(2), p 95-102, 1973.

Descriptors: *Clays, *Denitrification, *Nitrification, Soil, *Aquatic soils, *Nitrogen, Sulfates, Asia, Path of pollutants, *Soil chemistry.
Identifiers: *Alinine, Ammonium sulfate, Maahas clay(Philipines).

The fate of added N in submerged soils was studied using 15N-labelled ammonium sulfate and alanine. After 8 wk of incubation at 25 and 22%, respectively, of N from ammonium sulfate and alanine were recovered in the soil. Under the experimental conditions used N added to presubmerged soils was lost rapidly outside of the soil-water system, regardless of whether the N was organic or inorganic. Fractionation studies revealed that the amount of tagged N incorporated into exchangeable ammonium, residual fractions, volatized as NH3 and chemically fixed N was not enough to account for the N loss. The N loss was attributed to nitrification and subsequent denitrification during the incubation period. The effect of N-Serve (2-chloro-6-(trichloromethyl) pyrimidine) on nitrification of 15N-labelled (NH4)2S04 in submerged soils was studied. About 15% more N was recovered from non-presubmerged soil, and less nitrate was accumulated in presubmerged soils where N-Serve coated (NH4)2S04 was applied, than from soils where (S4)2S04 was applied with N-Serve. Presubmerged soils provided a more favorable environment for nitrification than for denitrification under the experimental conditions used.--Copyright 1974, Biological Abstracts, Inc.

HEAT DISPERSION IN PHYSICAL ESTUARINE MODELS; REPORT 2, EXPERIMENTS IN THE DELAWARE RIVER MODEL,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
M. J. Trawle.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-021 952, Price codes: A07 in paper copy, A01 in microfiche. Research Report H-75-2, February 1976. 139 p, 109 fig, 4 tab.

Descriptors: *Model studies, *Heat, *Dispersion, *Delaware River, Hydraulic models, Powerplants, Thermal powerplants, Electric powerplants, Estuaries, Tides, Flow, Streamflow, Heat transfer, Temperature, *Thermal pollution, *Path of pollutants, Cooling water.
Identifiers: *Thermal plumes.

This report is the second of three to be published on the results of investigations of heat dispersion in physical estuarine models conducted in the Delaware River and Trinity Bay models for the Office, Chief of Engineers, U.S. Army. The results of this investigation indicated that the Delaware River physical model at the U.S. Army Engineer Waterways Experiment Station can be used effectively to predict the thermal plume characteristics from certain types of heated discharges into the Delaware Estuary. Specifically, the discharges investigated on the Delaware River were classified as low densimetric Froude number discharges, i.e., canals or low-exit-velocity pipe discharges. The near-field distortion effect was at a minimum in the model with this type of discharge. It was mentioned that no comparative tests of high densimetric Froude number discharges (diffusers) have been conducted in the model, and, therefore, it cannot be concluded from the investigation that the Delaware River model can adequately predict thermal plume characteristics for the latter-type discharge into the Delaware Estuary, nor are the results of this study readily transferable to other estuary models, especially those of dissimilar estuaries or those of different scales. IMPROVING THE QUALITY OF WATER RELEASES FROM RESERVOIRS BY MEANS OF A LARGE DIAMETER PUMP,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
J. E. Garton, and C. E. Rice.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 548, Price code: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, 1976. 34 p, 16 fig, 1 tab, 4 ref. OWRT C-5228(No. 4215)(1).

Descriptors: *Reservoir relases, *Pumps, *Pumping, Stratification, *Destratification, Water quality, Oxygen, Temperature, Reservoir operation, *Oklahoma, Lakes, Iron, Manganese, Dissolved soils, Ammonia, Hypolimnion.
Identifiers: *Lake Arbuckle(Okla), Axial flow pumps.

In temperate climates, many lakes stratify during the summer. A typical stratified lake will have a warm oxygen-rich epilimnion, a thermocline, and a colder oxygen depleted hypolimnion. High levels of iron, manganese, hydrogen sulfide, and ammonia and dissolved hydrocarbons may occur in the hypolimnion. Many efforts have been made to destratify lakes, primarily by air bubbling. These methods require large energy inputs. A low-energy destratifier using 42-inch propellers to pump the water downward from the surface has been used successfully to destratify a 100 acre lake (35 feet deep) for 3 years. This project was an attempt to apply the same kind of device to Lake Arbuckle, a 2400 acre, 90-feet deep lake in south central Oklahoma. A 16.5-foot aircraft propeller was used to pump approximately 200,000 gallons per minute downward. Although the lake stability index was decreased by half, a corresponding reduction in the oxygen distribution index did not occur until the fall overturn. Thus, a lake can be weakly stratified thermally and strongly stratified chemically. The fall turnover occurred about a month earlier and more completely than normal during two years of operation. The oxygen content in the outlet waters near the pump was increased 1 to 2 mg/L during the critical summer months. (See also W77-00669)

PETROLEUM,
Rutgers - The State Univ., New Brunswick, N.
Dept. of Environmental Science.
J. V. Hunter, S. L. Yu, and W. Whipple, Jr.
In: Urbanization and Water Quality Contr
Proceedings No. 20, American Water Resourc
Association, Minneapolis, Minn., June 1975,
162-168. 2 fig, 3 tab, 3 ref. Edited by W. Whippl
Jr.

Descriptors: Water quality, Water pollut
sources, Oil pollution, *Oil waste
*Measurement, Organic compounds, Effluent
Pennsylvania, Water analysis, Sampling, Trea
ment facilities, *Industrial wastes, Water pollut
control.
Identifiers: *Urban runoff, *Nonpoint pollut
sources, Philadelphia(Penn).

Interim results are presented for the measureme
and analysis of petroleum hydrocarbons in urb
runoff. Numerous samples were taken for analy
through the storm hydrograph. Runoff from a rel
tively clean Philadelphia neighborhood showed
weighted mean concentration of 2.63 mg/l. Th
compares with average content of 1.56 mg/l
several samples of treated petroleum refinery e
fluent. Projections indicate that when refine
treatment plants now planned are all operable, t
urban runoff may have considerably more to
petroleum content than the refinery effluent.

EXPERIMENTS TO INVESTIGATE SUBSTA
TIAL LOAD OF SOILS AND TO PREDICT TH
LONG TERM EFFECTS OF WASTES O
GROUND WATER, (IN GERMAN),
Ministry of Agricultural Experiment Statio
Brunswick (West Germany).
N. El-Bassam.
Landwirtsch Forsch 28(3), p 175-182, 1975.

Descriptors: Percolation, Groundwater, Soil
Waste disposal, Path of pollutants, *Sewag
disposal fields, *Soil contamination, Soil analysi
Migration, Electrical conductance, Heavy metal
Mineralogy.
Identifiers: Mineral content(Soils).

Percolation and migration experiments have be
carried out since 1973 with and without radioacti
isotopes on undisturbed soil column from sewag
treated fields, to determine the mineral load
contaminated soils and to predict a possible lo
term effects of addition of wastes to soil on grou
water. The electrical conductivity of the leache
material from the contaminated soil columns i
dicated that it was higher (2.6 mmho/cm) than t
control (0.05). The mineral contents NO2, NO3,

Cl, Na, K, Ca, Mg and the heavy metals Zn and Cd were higher. Results of soil analysis confirm results of the percolation experiments concerning substantial load. Under given experimental conditions, the Zn migration rate was 10.8 cm/yr.--Copyright 1976, Biological Abstracts, Inc.

SEASONAL FLUCTUATIONS OF DIELDRIN RESIDUES IN THE TISSUES OF THE MARSH CLAM, RANGIA CUNEATA, FROM A TEXAS ESTUARY,
Texas A and M Univ., College Station.
S. R. Petrocelli, J. W. Anderson, and A. R. Hanks.
Texas Journal of Science, Vol. 26, No. 3-4, p 443-448, 1975.

Descriptors: *Pesticide residues, *Fluctuations, *Dieldrin, *Clams, *Seasonal, *Texas, Commercial shellfish, Bioindicators, Path of pollutants, Water pollution effects.
Identifiers: Rangia cuneata, *Trinity Bay(Texas).

The marsh clam, Rangia cuneata, was collected in Trinity Bay, Texas, in 1970 and 1971 and analyzed for residues of the chlorinated hydrocarbon insecticide, dieldrin, by gas-liquid chromatography. Analysis was carried out on ten individual clams randomly selected, shucked, and frozen. Recoveries of dieldrin from fortified clam tissue samples were above 85%. Clams collected in October and December 1970 had lower residues of dieldrin (mean and standard deviations were 7.9 plus or minus 1.5 ppb and 6.8 plus or minus 1.1 ppb, respectively) than those for February, April, and July (mean and standard deviations were 16.4 plus or minus 2.8 ppb, 16.6 plus or minus 1.4 ppb and 14.8 plus or minus 1.8 ppb respectively), or at least twice the fall values. These seasonal fluctuations in insecticide residues in tissue may be due to changes in river flow into the bay, with maximum tissue levels in months of large freshwater input. Also maturation of gonads and production of gametes in the spring and summer may cause higher whole body insecticide residue levels during these periods. (Buchanan-Davidson--Wisconsin)

NUMERICAL MODELS OF LAKE CURRENTS,
Case Western Reserve Univ., Cleveland, Ohio.
W. Lick.
Report EPA-600/3-76-020, April 1976. 151 p. 61 fig., 80 ref. R-802359.

Descriptors: *Hydrodynamics, *Littoral, *Mathematical models, *Lakes, *Currents(Water), Water pollution, Dispersion, *Lake Erie, Water circulation, Storm surge, Thermal pollution, Spatial distribution, Effluents, Influent streams, Mixing, Diffusion, Model studies, *Path of pollutants.

To understand fundamental aspects of contaminant dispersion in near-shore regions of large lakes and realistically describe currents, numerical models were developed. One steady-state, constant-density model was applied to overall circulation in Lake Erie, circulation when partially ice-covered, and circulation in a near-shore area (including a proposed jetport), plus a two-layer stratified lake. A second model is time-dependent, constant-density, free-surface model, to describe storm surges and similar motions. It was applied to storm surges in Lake Erie and a near-shore area. The third model is a time-dependent, variable-density, rigid-lid model which was used on river discharges, thermal plumes, and overall and near-shore circulation in a stratified lake. Vertically averaged models, which were relatively simple but did not give details in the vertical of the flow and caused errors in small time and variable-depth situations were used for parametric studies, lake circulation problems, river discharges, and thermal plumes. There models are sufficiently accurate to be used as bases for models of sediment resuspension and transport, dredging, plankton growth, community succession, etc. These numerical models do not consider wave effects. (Buchanan-Davidson--Wisconsin)

THE POTENTIAL CONTRIBUTION OF FERTILIZERS TO WATER POLLUTION,
Rutgers - The State Univ., New Brunswick, N. J. Dept. of Soils and Crops.
L. A. Douglas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 609, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institute, Rutgers University, New Brunswick, N. J. Partial Completion Report, June 1976. 92 p, 50 fig, 16 tab, 45 ref. OWRT A-027-NJ(6). 14-31-0001-3830.

Descriptors: *Nitrates, *Nitrites, *Ammonia, *Phosphates, *Leaching, *Fertilizers, Land use, *New Jersey, *Denitrification, Nitrogen, Nutrients, Water pollution sources.
Identifiers: N-SERVE.

Field studies were undertaken to determine the magnitude of leaching of fertilizer N03, NH4 and P04. The effect of N-SERVE on these reactions was observed, N-SERVE had little effect on leaching because most leaching takes place during the fall and winter when precipitation exceeds evapotranspiration. No leaching of NH4 or P04 was observed. The common fertilizer efficiency measure of N in crop/N applied in fertilizer may be used as an indication of the amount of fertilizer N that will be leached. Studies of nutrients in streams were undertaken to relate land use to N03, NH4 and P04 concentrations in surface waters. Sewage treatment plants and 'illegal drains' were major sources of all three ions. In order of decreasing contribution of N03: urban land contributes more than cropland which contributes more than woodlands. Urban lands, croplands and woodlands contribute equal amounts of NH4 and P04 to streams. The 'background level' of P04 in central New Jersey streams is many times higher than the 0.01 ppm level often advocated. Although very high concentrations of N03 were found in the soil solution in the subsoil the concentration of N03 found in streams was rather low. Denitrification must be an active process in subsoils, and probably in the groundwater.

EVALUATING IMPACT OF FOREST SITE PREPARATION ON SOIL AND WATER QUALITY IN THE U.S. GULF COASTAL PLAIN,
Forest Service (USDA), Oxford, Miss. Southern Forest Experiment Station.
D. C. McClurkin, and P. D. Duffy.
In: Forest Soils and Forest Land Management. Proceedings of the Fourth North American Forest Soils Conference, 1973, Quebec, p 315-321. 1975. 32 ref. Edited by B. Bernier and C. H. Winget.

Descriptors: *Forest management, *Water quality, Water quality standards, Watershed management, Soil physical properties, Coastal Plains, *Mississippi.
Identifiers: *Site preparation, *Site productivity, *Gulf Coastal Plain.

If projected U.S. timber needs of the year 2000 are to be met, at least 4 million hectares of bare or poorly stocked southern forest land must be planted with pine by 1985, and another 8 million hectares must be converted from low-grade hardwoods to pine. To meet these goals, land managers annually are drastically disturbing many thousands of hectares by tree crushing, brush chopping, disking, windrowing, bedding, burning, and chemical treatment to remove competing vegetation and prepare the soil for pine. Though evidence is limited, literature on past forest and agricultural practices resembling such intensive techniques indicates that there may be reason for concern. The environmental values at stake suggest research to determine (1) what significant changes in soil and water quality result from intensive forestry; (2) whether changes are adverse; and (3) if adverse, how practices can be modified to allow management for high yields without damaging impacts. Described are some of the considerations involved in such research, including initial survey and development of a sampling scheme. (Forest Service)

PHYSICAL AND CHEMICAL CHARACTERISTICS OF SEDIMENTS ORIGINATING FROM MISSOURI VALLEY LOESS,
Agricultural Research Service, Cheyenne, Wyo. North Central Region.
G. E. Schuman, R. F. Piest, and R. G. Spomer.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 3-28 - 3-40, 1976. 3 fig, 5 tab, 18 ref.

Descriptors: *Sediments, *Chemical properties, *Agricultural runoff, *Iowa, Nitrogen, Phosphorus, Carbon, Nutrients, Chemicals, Agricultural chemicals, Fertilizers, Erosion, Gully erosion, Rill erosion, Sheet erosion, Soil erosion, Loess, Soils, Suspended solids, Clays, Silts, Sands, Surface runoff, Sedimentation, Sedimentology.

Nitrogen (N) and phosphorus (P) associated with sediment in surface runoff accounted for at least 85% of N and P discharged from agricultural watersheds. The N and P content of the sediment was related to its carbon (C) content. At low flow,

the C concentration of the sediment increased, indicating the selectivity of the erosion process for organic material. The sediment showed an enrichment in the clay fraction over that contained in the surface soil, and this increase can result in a disproportionate increase in the discharge of those chemicals adsorbed to clay material. SEDIMENT-PHOSPHORUS RELATIONS IN SURFACE RUNOFF FROM IRRIGATED LANDS,
Agricultural Research Service, Kimberly, Idaho. Soil and Water Conservation Research Div.
D. L. Carter, M. J. Brown, and J. A. Bondurant.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 3-41 - 3-52, 1976. 8 tab, 11 ref.

Descriptors: *Sediments, *Phosphorus, *Irrigation, *Agricultural runoff, Erosion, Soil erosion, Nutrients, Irrigation practices, Suspended solids, Soils, Loam, Silts, Regression analysis, Chemicals, Chemistry, Sedimentation.

Phosphorus and sediment concentrations were measured in irrigation and drainage waters, and phosphorus and sediment inflows and outflows computed. Relationships between phosphorus and sediment were developed. Total phosphorus and orthophosphate concentrations measured in nonfiltered samples were closely related to the sediment concentration, but dissolved orthophosphate measured in samples filtered through 0.45 micrometer membrane filters was independent of the sediment concentration. A net sediment inflow was found on one large tract where sediment settles in drains and the amount of surface runoff is low, but a net sediment outflow was found for another tract with steeper drains and from which more surface runoff returned to the river. Net phosphorus inflows were measured on both tracts. Particle size segregation took place in irrigation and drainage waters whenever the flow velocity was slow enough to allow suspended sediment to settle, and the quantity of phosphorus per unit of sediment remaining suspended increased. Actually, much more phosphorus settles with that portion of the sediment that settles than remains in suspension where sediments are eroded from silt loam or loam soils. Thus, conditions favoring settling were phosphorus-conserving conditions. (See also W77-00775) (Sims-ISWS)
W77-00812

PESTICIDE CONCENTRATIONS AND YIELDS IN RUNOFF AND SEDIMENT FROM A MISSISSIPPI DELTA WATERSHED,
Agricultural Research Service, Baton Rouge, La.
G. H. Willis, L. L. McDowell, J. F. Parr, and C. E. Murphree.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 3-53 - 3-64, 1976. 5 fig, 2 tab, 7 ref.

Descriptors: *Pesticides, *Sediments, *Agricultural runoff, *Soil erosion, *Mississippi, DDT, DDE, Rainfall, Runoff, Erosion, Agricultural chemicals, Cotton, Crops, Farm management, Watersheds(Basins), Sediment yield, Regression analysis.
Identifiers: *Mississippi delta, Toxaphene, Trifluralin.

Pesticide concentrations were measured in runoff from a 15.6-ha (38.5-acre) watershed planted to continuous cotton. The watershed, consisting of Sharkey silty clay soil, had been formed for drainage with mean slopes of 0.2%. Measurements during 1973 and 1974 indicated a linear relationship between pesticide yields in runoff and sediment yields. Mean sediment yield was 27.6 metric tons/ha/year (12.3 tons/acre) when mean annual rainfall was 43.8 cm (17.2 inches) above the 30-year average of 125 cm (49.4 inches). Toxaphene, DDT, DDE, and trifluralin yields from the watershed in 1973, when no toxaphene or DDT was applied, were 117 (0.104), 87 (0.078), 7 (0.006), and 2 (0.002) g/ha (lbs/acre), respectively. Corresponding yields in 1974, when 10.08 kg toxaphene/ha (9 lbs/acre) were applied, were 97 (0.086), 27 (0.024), 6 (0.005), and 2 (0.002) g/ha (lbs/acre), respectively. In 1974, the mean annual concentrations of toxaphene, DDT, DDE, and trifluralin in runoff were approximately 11, 3.1, 0.6, and 0.2 microgram/liter (ppb). These sediment and pesticide yields are probably higher than would be expected in a year of normal rainfall amount and distribution. The data indicated the need, however, for improved erosion control practices on flat lands in the Delta to reduce the loss of valuable topsoil and to reduce pollution hazards from both sediment and farm chemicals. W77-00813

ROLE OF THE SEDIMENTATION IN THE SELF-PURIFICATION OF THE SCHELDT ESTUARY,
Laboratoire de Recherches Hydrauliques, Antwerp (Belgium).
J. J. Peters, and R. Wollast.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D. C., Sedimentation Committee, p 3-77 - 3-86, 1976. 6 fig, 2 ref.

Descriptors: *Estuaries, *Sedimentation, *Pollutants, *Belgium, Heavy metals, Water pollution, Path of pollutants, Salinity, Sediments, Bottom sediments, Nutrients, Diatoms, Oxygen, Organic matter, Turbidity, Suspended solids, Rivers, Saline water-freshwater interfaces, *Self purification.
Identifiers: *Scheldt Estuary(Belgium).

The hydrographic basin of the Scheldt River covers a heavily populated and industrialzed region and drains waters extremely polluted due to uncontrolled discharges. In this partially stratified estuary, the mixing process of fresh and salt water is responsible for an important deposition of the suspended load of the river in a restricted area corresponding to the harbor of Antwerp. This important shoaling is explained by the physico-chemical properties of the suspended matter and the hydrodynamical characteristics of the estuarine region. Taking into account the physical characteristics of the Scheldt, the estuary was divided into two zones: an upper one from km 100 to km 55 and a lower one from km 55 to the mouth. Four times a year fixed stations situated at the boundaries of these regions were managed during 5 days; hourly samples were taken at three depths and continuous measurements of the profile of the currents along a vertical were performed. A longitudinal survey was also executed monthly, following the low tide from the mouth to km 130. Approximately 50 surface samples were collected during each survey. The mechanisms and characteristics of the mud deposition and their influence on the mass-transport, the accumulation, and the transformation of some typical elements in the estuarine zone of the Scheldt were presented. Observations over three years enabled the annual mass balances of input, transport, and accumulation by sedimentation of various pollutants in the two estuarine regions to be estimated. The role of the sediments on the oxygen budget was deduced from the previous mass-balances. Large concentrations of nutrients persisted in the brackish water zone where oxygen was available and turbidity was low. As a consequence, this zone was eutrophied and diatom blooms were frequent. SIMULATION OF DISSOLVED OXYGEN AND BIOCHEMICAL OXYGEN DEMAND PLANTATION CANAL, BROWARD COUNTY, FLORIDA, WITH AN EVALUATION OF THE QUAL-I MODEL FOR USE IN SOUTH FLORIDA,
Geological Survey, Tallahassee, Fla.
T. N. Russo, and R. S. McQuivey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 375/, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 59-75, December 1975. 49 p, 15 fig, 7 tab, 13 ref.

Descriptors: *Mathematical models, *Dissolved oxygen, *Biochemical oxygen demand, *Canals, *Water quality control, Reaeration, Sewage effluents, Photosynthesis, Water management(Applied).
Identifiers: *Plantation canal(Fla), *Broward County(Fla).

A mathematical model; QUAL-I, developed by the Texas Water Development Board, was evaluated as a management tool in predicting the spatial and temporal distribution of dissolved oxygen and biochemical oxygen demand in Plantation Canal. Predictions based on the QUAL-I model, which was verified only against midday summer-flow conditions, showed that improvement of quality of inflows from sewage treatment plants and use of at least 130 cubic feet per second of dilution water would improve water quality in the canal significantly. The model was not fully amenable to use on Plantation Canal because: (1) it did not consider photosynthetic production, nitrification, and benthic oxygen demand as sources and sinks of oxygen; (2) the model assumptions of complete mixing, transport, and steady state were not met; and (3) the data base was inadequate because it consisted of only one set of data for each case. However, it was felt that meaningful results could be obtained for some sets of conditions. (Woodard-USGS)

SOURCES OF ARSENIC IN STREAMS TRIBUTARY TO LAKE CROWLEY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
L. A. Eccles.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 856, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 76-36, June 1976. 39 p, 6 fig, 9 tab, 21 ref.

Descriptors: *Water pollution sources, *Trace elements, *Water quality, *Hot springs, *California, Water analysis, Surface waters, Lakes, Chemical analysis, Water chemistry, Geochemistry, Geothermal studies, Path of pollutants, Water supply, Public health.
Identifiers: *Arsenic, *Lake Crowley(Calif), Los Angeles(Calif).

Lake Crowley is the largest single source of water for the city of Los Angeles. More than 50 percent of the water entering the Los Angeles-Owens River aqueduct flows through Lake Crowley. Arsenic enters Lake Crowley primarily from hot springs in Long Valley. Sixty percent of the arsenic discharged to Lake Crowley is from hot springs in Hot Creek Gorge. The hot-spring water containing about 1,000 micrograms per liter of arsenic blends with the water flowing in the creek and is usually diluted to a concentration of about

micrograms per liter; additional dilution oc-
s downstream. About 75 percent of the arsenic
Hot Creek is discharged from only two springs.
remaining sources of arsenic in the gorge are
rly defined seepage and flow from numerous
ll springs. Other sources of arsenic in Long
ley are from either high volume and low-ar-
ic concentration springs, such as the springs at
Creek Fish Hatchery, or high-concentration
low-volume springs, such as those found in
vicinity of the Alkali lakes. These other
rces individually are small in comparison with
source in Hot Creek Gorge. It is unlikely that
nic from these sources could cause the arsenic
centration in Lake Crowley to exceed the En-
nmental Protection Agency's recommended
erion (limit) for public water supply.

UNICIPAL PHOSPHORUS LOADINGS TO KE ERIE, AN EVALUATION STUDY EPARED FOR THE GREAT LAKES WATER ALITY BOARD.
ernational Joint Commission-United States and
nada, Windsor (Ontario). Great Lakes Water
ality Board.
cember 1975. 40 p, 2 fig, 4 tab, append.

scriptors: *Phosphorus, *Lake Erie, *Sewage
luents, Water pollution sources, Treatment
ilities, Sludge treatment, Nutrient removal,
passes, Combined sewers, Storm water, Biochemical oxygen demand, Suspended solids, Michigan, Ohio, Indiana, Pennsylvania, Canada, *Organic loading.
Identifiers: *Phosphorus loadings, Ontario, Detroit(Mich), Cleveland(Ohio), Toledo(Ohio), Akron(Ohio), Erie(Ohio), Fort Wayne(Ind), Windsor(Ontario), London(Ontario), Kitchener(Ontario).

In an effort to determine the 1974 annual phosphorus loadings to Lake Erie, treatment plants in Detroit, Cleveland (Easterly, Southerly and Westerly), Toledo, Akron, Wyandotte, Erie, Fort Wayne, Windsor, London and Kitchener were visited and their operational efficiencies evaluated. Another objective was to assess the pollution loadings from plant bypasses and combined sewer overflows. The overall performance of each of the treatment plants in 1973 and 1974 is summarized and the average concentrations for phosphorus, BOD and suspended solids are shown. Seven of the 12 plants had not achieved the phosphorus concentration of 1 mg/l in their effluents despite the fact that they have installed phosphorus-removal facilities. Unmonitored sewage bypasses within the plants do not appear to constitute a significant portion of the phosphorus loading; there were insufficient quanitative data on combined sewer and stormwater overflows. The most frequent cause of operational problems experienced was inadequate sludge handling facilities but remedial actions were underway. When the targeted phosphorus reduction levels are achieved the total phosphorus loadings will be reduced from 18,000 to 5,700 kg/day, a decrease of almost 70%. (Auen-Wisconsin)

ASBESTOS IN THE GREAT LAKES BASIN WITH EMPHASIS ON LAKE SUPERIOR, A REPORT TO THE INTERNATIONAL JOINT COMMISSION FROM THE GREAT LAKES RESEARCH ADVISORY BOARD.
International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
February 1975. 101 p, 14 fig, 15 tab, 36 ref, 5 append.

Descriptors: *Asbestos, *Lake Superior, Water pollution, Air pollution, St. Lawrence River, Great Lakes, International Joint Commission, Waste water treatment, Mineraology, Minnesota, Mining, Analytical techniques, Judicial decisions, Spatial distribution, Bottom sediments, Waste water(Pollution), Monitoring, Public health, Hazards.
Identifiers: *Reserve Mining Co., *Silver Bay(Minn), Duluth(Minn), Taconite mining.

Beginning with a description of asbestos properties and its analytical enumeration and identification, asbestos pollution is discussed in the context of medical research and human health hazards. Research on the distribution of asbestos in aqueous suspensions, in potable water, in air, and in Lake Superior sediments is summarized, as well as asbestos areal distribution in Lake Superior and the Great Lakes and concommitant biological aspects. Specific research needs are delineated particularly as related to (1) counting and identification methods, (2) sampling programs, (3) public health hazards and hazards to aquatic organisms resulting from asbestos ingestion and sedimentation, and (4) the necessity to quantify and characterize trans-boundary asbestos pollution. Appendices detail the taconite mining and beneficiation process, the water requirements and waste water disposal practices of the Reserve Mining Company at Silver Bay Minnesota: the chronology of the Reserve Mining case through the various state and federal agencies and the courts; the International Joint Commission's hearings, and the current monitoring programs. The final appendix reprints the U.S. Eighth Circuit Court of Appeals decision and the presiding judge's essential Findings of Fact and Conclusions of Law. (Auen-Wisconsin)

WATER POLLUTION INVESTIGATION: BLACK RIVER OF NEW YORK.
Hydroscience, Inc., Westwood, N. J.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-242 019, Price codes: A05 in paper copy, A01 in microfiche. Report EPA 905/9-74-009, December 1974. 107 p, 21 fig, 13 tab, 5 ref, 3 append. EPA 68-01-1573.

Descriptors: *Lake Ontario, *Rivers, *Water pollution, *New York, *Water pollution control, Model studies, Dissolved oxygen, Sewage effluents, Industrial wastes, Municipal wastes, Biochemical oxygen demand, Low flow, Water quality standards, Reaeration, Waterfalls, Dams, River flow, Effluents, Biota, Projections.
Identifiers: *Black River(NY), Moase River(NY), Beaver River(NY).

A dissolved oxygen model was used to project the effect of proposed wastewater discharges on dissolved oxygen levels of the Black River, New York, which terminates in Lake Ontario. These discharges represent the best practical control technology presently available for industries and conventional secondary treatment for municipalities. New York dissolved oxygen standards will be met for design low flow conditions. Dissolved oxygen levels between Lyons Falls and Carthage were below the standard. Dissolved oxygen measurements upstream showed a background dissolved oxygen deficit not associated with direct waste water discharges. Of the ultimate biochemical oxygen demand discharged to the Black River and its tributaries, 85% was from industrial sources and 15% from municipalities. The Black River is reoxygenated by flows over dams and natural falls. Dissolved oxygen levels should be determined to define the magnitude and spatial distribution of the background deficit and its relation to agricultural runoff or seasonal variations. The degree of aeration and factors such as dam height, river flow, and temperature should be correlated. Because of a discrepancy between measured and computed river BOD concentrations it is recommended that the BOD oxidation mechanism in the Black River be further investigated. Descriptors: *Oil wastes, *Ships, *Oceans, *Water pollution sources, *Ocean circulation, Surface waters, Tides, Oil pollution, Oil spills, Oily water, Fuels, Bacteria, Benthic fauna, Research priorities, Data collections, International commissions, Water quality control.
Identifiers: *Pelagic tar.

The term 'pelagic tar' describes tarry residues of petroleum that are found on the surface of the ocean. In recent years there has been great concern that pelagic tar deposits, which mainly come from the discharge of waste by tankers, are rapidly polluting the oceans. At the least they are breeding grounds for oxygen-eating bacteria. At worst, they may result in disruption of the ocean's ecosystem. This article examines the characteristics, disintegration rates, and effects on other organisms of pelagic tar. Due to a lack of data, no definite conclusions are reached. However, there is a chance that critical damage to subtle chemical communication signals between ocean organisms may have already begun. Thus, the dumping of petroleum wastes should be stopped immediately by whatever international sanctions are available. (Frank-Florida)

SHIGELLA RESEARCH IN THE SEA AND IN AN ESTUARY: I. FREQUENCY OF BACTERIOPHAGES IN POLLUTED WATER, (IN FRENCH),
Institut Royal des Sciences Naturelles de Belgique, Brussels.
Z. Dartevelle, and L. Desmet.
Ann Microbiol (Paris) 126B(1), p 95-97, 1975.

Descriptors: *Shigella, E coli, Estuaries, Bacteria, *Bacteriophage, Bays, Europe, Sampling, Water pollution sources, *Path of pollutants.
Identifiers: Italy, Shigella-sonnei, Yugoslavia, *Bay of Trieste(Italy), *Adriatic Sea(Yugoslavia), *River Isonozo(Italy).

Water samples in the Bay of Trieste, Italy, were taken from the bay receiving the city waste waters, the river Isonzo and the Adriatic Sea along the Yugoslav coast. The bay waters were particularly polluted, 95% of samples containing bacteriophages specific for Escherichia. coli B., E. coli 125 and Shigella sonnei YCD. S. sonnei comprises 80% of the shigellas currently isolated in Europe. (See also W77-01021 and W77-01022)--Copyright 1976, Biological Abstracts, Inc.

SHIGELLA RESEARCH IN THE SEA AND IN AN ESTUARY: II. ATTEMPT TO INHIBIT THE ADSORPTION OF SHIGAPHAGES AND STUDIES OF SHIGELLA ON A SELECTIVE MEDIUM, (IN FRENCH),
Institut Royal des Sciences Naturelles de Belgique, Brussels.
Z. Dartevelle, and L. Desmet.
Ann Microbiol (Paris) 126B(1), p 99-100, 1975.

Descriptors: *Shigella, Estuaries, Europe, Adsorption, Bacteria, Inhibition, Path of pollutants, Water pollution sources.
Identifiers: *Shigaphages, *River Ysar estuary(Belgium).

Two different bacteriological methods were tried in an attempt to identify the presence of Shigella organisms in sea water and in the Nieuwpoort channel, estuary of the river Ysar in Belgium. By 1 method, involving glycerin addition to the water to attenuate shigaphages, no Shigella were demonstrated although they probably were present in sewer water. Using the other method, with XLD medium, no shigellas were found. The lack of success may be due to the dissemination of bacteria in a hostile environment and to the presence of a competitive, possibly inhibitory, flora. (See also W77-01020 and W77-01022)--Copyright 1976, Biological Abstracts, Inc.

SHIGELLA RESEARCH IN THE SEA AND IN AN ESTUARY: III. IN VITRO DETERMINATION OF THE SURVIVAL TIME OF SHIGELLA SONNEI YCD IN SEA WATER, (IN FRENCH),
Inst. R. Sci. Nat. Belg., Bruxelles, Belg. Institut Royal des Sciences Naturelles de Belgique, Brussels.
Z. Dartevelle, and L. Desmet.
Ann Microbiol (Paris) 126B(1), p 101-103, 1975.

Descriptors: *Shigella, Estuaries, Sampling, Path of pollutants, Mortality, Laboratory tests, Water pollution sources.
Identifiers: *Shigella-Sonnei.

S. sonnei YCD were incorporated in freshly collected sea water, stored at refrigerator temperatures for 2 h-15 days then recuperated by bacteriologic techniques. Concentrations of 1 Shigella organsm/ml survived 6-24 h; 100 organisms/ml survived 8-10 days and 10,000 shigellae/ml survived 4-8 days. Despite the negative results of previous attempts to isolate Shigella organisms from sea water and bay water, the recuperation of Shigella from a marine environment is possible. SANITARY AND HYGIENIC EVALUATION OF THE QUALITY OF UNDERGROUND DRINKING WATER, (IN RUSSIAN),
Municipal Sanitary Epidemiology Station, Zhukovskii (USSR)
M. P. Vasil'Ev, and T. V. Laikhter.
Gig Sanit 3, p 110-111, 1975.

Descriptors: *Water quality, *Potable water, Public health, Bacteria, *Artesian wells, Water wells, Bioindicators, Confined water, Subsurface water.
Identifiers: Russian-Sfsr.

Ten - year observations of drinking water from artesian wells in the city of Zhukovskii (Russian SFSR, USSR) showed that the bacteriological indices (including coli titer) have remained stable at the level of the water quality standards. In the well water there have been changes in the mineral composition, hardness and content of Fe, sulfates, chlorides and ammonium N. The stability of the bacteriological indices indicates the absence of surface and deep subsurface water pollution sources. Changes of chemical composition in some artesian wells are due to geologic processes occurring in subsurface aquifers.--Copyright 1976, Biological Abstracts, Inc.

N INVESTIGATION INTO THE EFFECT AND AUSE OF EUTROPHICATION IN GEOR- ETOWN LAKE, MONTANA,
ontana State Univ., Bozeman. Water Resources esearch Center.
Knight, P. Garrison, and J. Wright.
vailable from the National Technical Informa- on Service, Springfield, VA 22161 as PB-259 271, ice codes: A05 in paper copy A01 in microfiche. esearch Report No. 77, (1976). 97 p, 26 fig, 12 b, 57 ref. OWRT A-067-MONT(1).

escriptors: *Eutrophication, *Water quality, iological studies, Phytoplankton, Macrophytes, Montana, Lakes, Water pollution effects, ycling nutrients, Land use, Planning.
entifiers: Georgetown Lake(Mont), Nutrient ycle, Land-use planning.

eorgetown Lake, located 15 miles west of naconda Mining Company, is the most heavily- ed lake in Montana for its size. Because of the ncern for the status of the lake and the potential r development of the watershed, the county mmissioners and conservation districts from eer Lodge and Granite Counties agreed that a udy is needed to be conducted for an overall nd-use plan for the Georgetown Lake watershed. esults include: The phytoplankton appeared to lapt to the low light levels under the ice cover. ankton respiration rates were greater than the ankton gross photo-synthetic rates which in- cates that there is rapid decomposition of dead ytoplankton and additional autochthonous in- uts, i.e. macrophytes. Annual average daily gross oto-synthesis was 0.5 g.C.m-2.day. Plankton oduction during the winter was light limited. osphorus was apparently more limiting than N uring the summer even though both nutrients ere reduced to very low levels. Oxygen depletion nder the ice was due to both sediment and plank- n respiration rates. Additional oxygen input nder the ice was required to compensate for the spiration rates. Macrophytic production and to a mited degree, ice-melt are responsible for the ox- gen input during ice cover. The lake was not in a eady state since annual photosynthetic rates ere greater than annual respiration rates. This in- cates organic matter is accumulating in the sedi- ents. Macrophytic production is of major im- rtance in regulating the lake metabolism.

dentifiers: Saronikos Gulf, Athens, Greece.

he effect of discharging untreated domestic ewage from the city of Athens, Greece, on an ea of restricted circulation in the upper aronikos Gulf was investigated by delineating the olor, odor, organic carbon, and acoustic reflec- on properties of bottom sediments. The scharge of untreated sewage via outfall has led the deposition and growth of a large sludge eld, with approximately 9 sq km of the sea floor being covered by black anoxic muds which give off hydrogen sulfide and are essentially devoid of benthic life. The organic carbon content of the muds is over 6% in some areas near the outfall in comparison with normal regional values of less than 0.5%. Seismic reflection characteristics which are believed to coincide with the production of methane gas distinguish a core area around the outfall. The circulation and oxygenation in the upper Saronikos Gulf are not adequate to disperse the waste water from the Athens area, with the result being that the benthic environment is rapidly being destroyed. Y. Iitaka, R. Tsunda, T. Morinaga, and H. Kumai.
Mer (Tokyo). 11(4), p 205-210, 1973.

Descriptors: Water pollution effects, Aquatic life fish, *Zooplankton, *Growth rates, Rotifers, *Fish eggs.
Identifiers: *Slag.

The adhesion of aquatic life to iron slag dropped in the sea was observed. Fish were bred in containers either with or without slags. The growth rate of zooplankton, rotifer and the survival rate of fish eggs and larvae were studied. There were minor effects on the aquatic life. The aquatic organisms adhered to or gathered around slags immediately after they were dropped in the sea. The growth rate of fish in containers containing slags was better than that in containers without slag.--Copyright 1975, Biological Abstracts, Inc.

HEAVY METALS IN SOME NEW ZEALAND COMMERCIAL SEA FISHES,
Massey Univ., Palmerston North (New Zealand). Dept. of Chemistry, Biochemistry and Biophysics.
R. R. Brooks, and D. Rumsey.
N Z J Mar Freshwater Res. 8(1), p 155-166, 1974.

Descriptors: Heavy metals, Cadmium, Iron, Lead, Manganese, Nickel, Marine fish, Commercial fish, Copper, Chromium, Trace elements, Zinc, Toxicity.
Identifiers: Arripis-Trutta, Caranx-Lutescens, Cheilodactylus-Macropterus, Chrysophrys-Auratus, King-fish, Latridopsis-Ciliaris, *New Zealand, Polyprion-Oxygeneios, Seriola-Grandis, Snapper, Trigla-Kumu.

To establish a base line against which future pollution may be measured, 8 common commercial species of New Zealand sea fish were analyzed for Cd, Cr, Cu, Fe, Pb, Mn, Ni and Zn. One sample of edible muscle tissue was analyzed for each of 70 samples of each species. The internal organs of up to 5 specimens of each species were also analyzed. The fish studied were: kahawai, Arripis trutta, trevally, Caranx lutescens, tarakihi, Cheilodactylis macropterus, snapper, Chrysophrys auratus, moki, Latridopsis ciliaris, hapuku, Polyprion oxygeneios, kingfish, Seriola grandis and gurnard, Trigla kumu. Although none of the edible parts of the fish appeared to have trace element levels likely to be a public health problem (Cd 0.002-0.02 ppm, Cr 0.01-0.04 ppm, Cu 0.04-0.95 ppm, Fe 0.9-13.5 ppm, Pb 0.14-0.95 ppm, Mn 0.04-2.00 ppm, Ni 0.01-0.08 ppm, Zn 2.0-36.0 ppm), some of the organs (particularly the liver) had relatively high concentrations of elements such as Cd (up to 54 ppm). Only if some industry were to seek to exploit internal organs of fish for human consumption would such levels become important. There was some evidence for a relationship between trace element concentrations and fish size for Cu in king-fish and snapper, Fe in hapuku, Mn in gurnard, and for Zn in kingfish and tarakihi. Some element pairs such as Cu and Zn, Fe and Mn, appeared to have concentrations which were mutually related. It was assumed that the elemental concentrations reported represent natural levels and are not the result of significant man-made pollution because there are no major industries or large urban centers adjacent to the fishing grounds.--Copyright 1975, Biological Abstracts, Inc.

TOXICITY OF PARAQUAT TO PARACALLIOPE FLUVIATILIS (AMPHIPODA),
Canterbury Univ., Christchurch (New Zealand). Dept. of Zoology.
D. M. Hunt.
Mauri Ora. 2, p 67-72, 1974.

Descriptors: *Toxicity, Mortatity, *Amphipoda, *Paraquat, Herbicides, Water pollution effects, Aquatic weed control.
Identifiers: *Paracalliope-Fluviatilis.

Toxicity of the bipyridilium herbicide paraquat (used to control aquatic weeds) to the amphipod P. flubiatilis was investigated in the laboratory. Amphipods died in concentrations as low as 0.05 ppm. Mortality was greater among smaller amphipods. A delayed toxic effect was exhibited, with 70% of the amphipods accumulating a lethal dose after 10 h in 0.1 ppm paraquat. Paraquat adsorbed to sediment was still available for uptake by amphipods, although mortality rates were lower than those in paraquat solution.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: Bayous, Eutrophication, *Phosphates, Nutrients, Oxygen, *Bacteria, Dissolved solids, Glucose, *Dissolved oxygen, Estuaries, Absorption, Productivity, Kinetics, *Sediments, Microorganisms, *Oxidation-reduction potential.
Identifiers: *Oxygen depletion, *Glucose, Heterotrophic productivity, *Nutrient exchange.

Over a two-year period, certain aspects of nutrient exchange and regeneration were studied as related to major physical, chemical, and microbial parameters in two bayou estuaries. Sediment to water phosphate (PO3-4) exchange was affected by dissolved oxygen concentrations in both systems, but Eh effects of oxygen depletion on PO3-4 exchange kinetics differ in the two bayous. Sediment Eh profiles follow a temporal pattern perhaps related to the bacterial activity. Glucose

concentrations and uptake were monitored as related to possible sources and utilizers respectively. (Morgan-Florida)

AN AQUEOUS ENVIRONMENTAL SIMULATION MODEL FOR MID-SOUTH LAKES AND RESERVOIRS,
Arkansas Univ., Fayetteville. Coll. of Engineering.
L. J. Thibodeaux.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 539, Price codes: A05 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Publication No. 41, Engineering Experiment Station, Research Report No. 27, June 30, 1976. 82 p, 26 fig, 6 tab, 31 ref, append. OWRT A-026-ARK(3). 14-34-0001-6058.

Descriptors: *Arkansas, Water pollution effects, *Mathematical models, Lakes, Aqueous environment, *Simulation analysis, *Eutrophication, Forecasting, Reservoirs, *Model studies, Computer programs, Fish, Stratification, Aerobic bacteria, Phytoplankton, Zooplankton.
Identifiers: *Beaver Reservoir(Ark).

Quantitative relationships and associated computer program have been developed to simulate some of the major physical, chemical and biological processes occurring within the aqueous phase of lakes and reservoirs. The model was developed, in part, to study the eutrophic development of these water bodies. Emphasis is upon lakes in the Mid-South U.S.A. The physical model reflects the general environment in this region and includes a single stratified period. The chemical subsystem includes nitrogen, phosphorus, oxygen and carbon. The biological subsystem includes phytoplankton, zooplankton, omnivorous fish, carnivorous fish and aerobic bacteria. The model differential equations are solved numerically with the IBM Continuous System Modeling Program (CSMP). The output results (graphical or numerical) of critical eutrophic parameters can be obtained as a function of time (Julian Day), depth and distance down-lake. The model has been adjusted to field data from Beaver Reservoir in Northwest Arkansas. A comparison of the adjusted simulation and the field data is presented along with examples of use of the model for predictive purposes. An appendix contains the program listing, documentation and case studies. (See also W76-11692)

INFLUENCE OF WATER TREATED ARTIFICIALLY WITH HERBICIDES ON HONEY BEE COLONIES,
Agricultural Research Service, Tucson, Ariz.
H. L. Morton, J. O. Moffett, and R. D. Martin
Environ Entomol. 3(5), p 808-812, 1974.

Descriptors: *Herbicides, *Paraquat, Water pollution effects, Insects.
Identifiers: Apis-Mellifera, *Honey bee colonies.

Apis mellifera L. colonies were placed in isolated desert apiaries where their only source of water contained paraquat (concentration of 1000 parts per million active ingredient by weight (ppmw)). Large numbers of bees exposed to paraquat died immediately, and all were dead before the end of the 5th wk. When colonies were similarly exposed to like amounts of 2,4,5-T, larger numbers of bees drowned in the water because of the lower surface tension of the water, and production of brood was reduced below that of check colonies during the period the treated water was used and for 3 mo. thereafter; however, in the subsequent 9 mo., production returned to normal. Concentrations of 2,4,5-T in honey bees from colonies using water containing 2,4,5-T were as high as 148 ppmw, but this level dropped to about 5 ppmw as soon as the bees began using untreated water. Likewise, honey from colonies using water containing 2,4,5-T contained concentrations of 2,4,5-T as high as 50 ppmw; however, the concentration dropped to about 5.0 ppmw within 1 wk after the bees began using untreated water. The last day when any 2,4,5-T was detected in honey bees and honey from treated colonies was 480 days after the experiment began. Wax from colonies using the treated water contained detectable amounts of 2,4,5-T 650 days after the study was initiated.--Copyright 1975, Biological Abstracts, Inc.

THE SEDIMENTS OF LAKE GEORG (UGANDA). I: REDOX POTENTIALS, OXYGE CONSUMPTION AND CARBON DIOXIDE OU PUT,
Malaya Univ., Kuala Lumpur (Malaysia). Scho of Biological Sciences.
A. B. Viner.
Archiv fur Hydrobiologie, Vol. 76, No. 2, p. 18 197, 1975. 8 fig., 13 ref.

Descriptors: *Bottom sediments, *Oxidatio reduction potential, *Oxygen demand, *Carb dioxide, *Cycling nutriets, Dynamics, Tropical r gions, Eutrophication, Metabolism, Dissolv solids, Phosphates, Nitrogen, Oxygenation, C ganic matter, Mud, Microorganisms, Africa.
Identifiers: *Lake George(Uganda).

To understand nutrient dynamics in tropical lak bottom sediments of equatorial, eutrophic La George (Uganda) were studied. The gross metab ic activity of sediments was studied to indicate t amount of mineralization possible. Low dissolv nutrient concentrations and high primary bioma producers did not permit nutrient utilization ra of change to be measured. Phosphate and in ganic combined nitrogen critically influenced p mary production measurements. Turbulen through the shallow water column disturbed rich organic sediments. Gross metabolic activity w measured in terms of oxygen consumption, carb dioxide liberation, and oxidation-reduction pote tial changes. Metabolic rates in vertical m profile samples were strongly dependent on o ygen supply, which was largely controlled by t bulent mixing of water into mud and rapid oxyg consumption by large amounts of organic matter the sediments. Turbulent mixing probably co tributed to distribution of bacteria to about 18 c of mud. This volume of mud could potentia supply nutrients to the water column, but the c ganic content permitted such rapid oxygen utili tion that aerobic bacterial metabolism stopp quickly. Succession of various anaerobic micro ganisms was blocked. Reduced aerobic activ preserved organic material in an undecompos state. The significance of nutrient recycling fr sediments was limited compared to prima producer potential demands. (Buchanan-Dav son—Wisconsin)
W77-00712

THE ROLE OF SEDIMENT AS A MODIFYI FACTOR IN PESTICIDE-ALGAE INTERA TIONS,
Rutgers - The State Univ., New Brunswick, N. Dept. of Botany.
M. A. Gillott, G. L. Floyd, and D. V. Ward.
Environmental Entomology, Vol. 4, No. 4, p. 62 624, 1975. 1 tab., 32 ref.

Descriptors: *Sediments, *Pesticides, *Algae, I hibition, Insecticides, DDT, Photosynthes Euglena, Adsorption, *Toxicity, Translocatio Water pollution effects, Pesticide residues.
Identifiers: Carbaryl, Abate.

To determine the influence of pesticide-sedime associations on pesticide-algae interactions, hibitory effects of three pesticides (DDT, Aba and carbaryl) on algal photosynthesis were studi in one compartment (axenic Euglena gracilis c tures) and two compartment (alga plus sedime systems. Carbon-14 incorporation was used to dicate photosynthetic activity. Twenty-four ho exposures to either DDT or carbaryl caused s nificant inhibition of photosynthesis in E. graci at concentrations of 10 ppb or higher. Abate w only marginally inhibitory at concentrations up 100 ppb. Sediment dampened the pesticide effe Differences between toxicities in 1 and 2 compa ment systems were statistically significant for three insecticides. Addition of sediment caus only slight increases in photosynthesis relative non-sediment samples at the lowest pestici levels; but at greater concentrations the sedime effect was greater. The size of sediment, the

ganic matter content, or presence of detergents or other surfactants could alter the sediment effects. The significant reduction of photosynthesis of E. gracilis by carbaryl or DDT in the presence of sediments, would suggest that in nature sediments would dampen insecticide toxicities, especially in shallow bodies of water with large surface to volume ratios. (Buchanan-Davidson--Wisconsin)

DETRITUS FORMATION FROM EELGRASS (ZOSTERA MARINA L.): THE RELATIVE EFFECTS OF FRAGMENTATION, LEACHING, AND DECAY,
Dalhousie Univ., Halifax (Nova Scotia).
P. G. Harrison, and K. H. Mann.
Limnology and Oceanography, Vol. 20, No. 6, p. 924-934, 1975. 7 fig., 8 tab., 29 ref.

Descriptors: *Marine plants, *Detritus, *Degradation(Decomposition), *Leaching, Leaves, Biodegradation, Laboratory tests, Particle size, Organic matter, Sea water, Nitrogen, Littoral, Carbon, Drying, Primary productivity, *Canada, *Decomposing organic matter.
Identifiers: *Eelgrass, St. Margaret's Bay(Nova Scotia).

Decomposition reduces leaf particulate detritus to subparticulate forms by fragmentation, autolysis, leaching, and microbial decay. Eelgrass detritus consists of nonliving leaf debris and associated, living microorganisms. In laboratory experiments, dead eelgrass leaves lost 35% of their original dry weight in 100 days at 20C. Whole leaves lost 0.5% of their organic content/day, while particles less than 1 mm lost 1%/day. Sterilization of leaves by dry heat or potassium cyanide indicated that leaching accounted for 82% of the organic matter lost from predried material and 65% of that lost from undried material. Bacteria increased detrital nitrogen but degraded leaf material slowly. When protozoa grazed on bacteria, they kept the bacteria in an active metabolic state and increased decay rates. Incubated detritus carbon:nitrogen ratios decreased from 20:1 to 11:1, indicating an increase in potential food value. This slow decomposition rate could permit the eelgrass detritus system to continue functioning during short-term fluctuations in eelgrass primary production by ensuring the presence of slowly decomposing material. A model illustrates the eelgrass detritus system. Formation of detritus from eelgrass leaves is important in many coastal marine environments. (Buchanan-Davidson--Wisconsin)

SOME THEORETICAL CONSIDERATIONS OF THERMAL DISCHARGE IN SHALLOW LAKES,
Hydrobiologisch Institutt, Nieuwersluis (Netherlands).
H. L. Golterman.
H20 (The Netherlands), No. 1, p 19-26, January 1976. 16 fig, 19 ref.

Descriptors: *Water pollution effects, *Thermal pollution, *Shallow water, *Biological communities, *Lakes, Photosynthesis, Respiration, Inhibition, Succession, Ecosystems, *Water temperature, Cycling nutrients, Competition, Zooplankton, Food chains, Theoretical analysis, Growth rates, Biomass, Dominant organisms, Eutrophication, Europe.
Identifiers: *Netherlands.

Effects of artificially elevated water temperature by thermal discharge on zooplankton and phytoplankton are described. Energy in aquatic ecosystems enters food chains via phytoplankton and is then dispersed via zooplankton or bacteria. Temperature increases affect net phytoplankton growth positively or negatively, depending on species. At high temperatures, mineralization occurs more rapidly and causes faster growth rates, but not necessarily larger biomass. Temperature strongly influences the selection of dominant species. Both temperature and eutrophication act synergistically to stimulate production of blue-green algal blooms. High temperatures increase the number of zooplankton generations per year without increasing food production. The deleterious effect on overwintering fauna may leave openings in the ecosystem and disturb the predator-prey processes. Tolerance of ecosystems to temperature changes is smaller in winter than in summer. (Buchanan-Davidson--Wisconsin).

PHYTOPLANKTON SUCCESSION IN A MATURING NORTHWEST TEXAS RESERVOIR (LAKE MEREDITH),
West Texas State Univ., Canyon. Dept. of Biology.
W. Z. Cooper, and C. E. Newton.
Texas Journal of Science, Vol. 26, No. 3-4, p. 449-458, 1975. 5 fig, 3 tab, 19 ref.

Descriptors: *Biological communities, *Succession, *Phytoplankton, *Reservoirs, *Texas, Dissolved oxygen, Temperature, Cycles, Chlorophyta, Nitrogen, Diatoms, Phosphorus, Cyanophyta, Euglenophyta, Pyrrophyta.
Identifiers: *Lake Meredith(Texas), Ankistrodesmus falcatus, *Cyclotella meneghiniana, Coelastrum microporum, Oocystic borgei.

Lake Meredith, a young, relatively deep impoundment in Texas, was studied from November 1966 to April 1968. Nitrate peaks were observed periodically. Phosphate levels were high at first, but then did not exceed 0.2 mg/1. A temporal succession of phytoplankton was observed which apparently was due to an organism-produced phosphorus depletion. After depletion, phosphorus remained at an almost constant concentration which was more limiting for the green alga, Ankistrodesmus falcatus, than was nitrogen for the diatom, Cyclotella meneghiniana. Cyclotella blooms are controlled by the nitrogen level, thus Cyclotella began to decrease earlier and depleted nitrogen and phosphorus supplies before there was enough phosphorus for Ankistrodesmus to compete. With Ankistrodesmus no longer a dominant part of the community, two colonial algae, Coelastrum microporum and Oocystis borgei filled the niche in community structure. During this period the structure of the blooms began to change: green algal blooms before and after the Cyclotella blooms became smaller and blended with diatom to form a symmetrically cumulative bloom. The identified species are listed, grouped in the order of abundance. (Buchanan-Davidson--Wisconsin)

EFFECTS OF ENVIRONMENTAL FACTORS ON PHOTOSYNTHESIS PATTERNS IN PHAEODACTYLUM TRICORNUTUM (BACILLARIPHYCEAE). II. EFFECT OF OXYGEN,
University Coll., London (England). Dept. of Botany and Microbiology.
J. Beardall, and I. Morris.
Journal of Psychology Vol. 11, No. 4, p. 430-434, 1975. 5 fig., 3 tab., 12 ref.

Descriptors: *Environmental effects, *Photosynthesis, *Diatoms, *Oxygen, Light intensity, Marine algae, Inhibition, Bicarbonates, Hydrogen ion concentration, Respiration, Plant physiology.
Identifiers: *Phaeodactylum tricornutum.

The rate of light-saturated photosynthesis of the marine diatom Phaeodactylum tricornutum was inhibited by oxygen only if the oxygen concentrations approached 100%. At atmospheric oxygen concentrations (21%), there was little effect on photosynthesis. In this respect, Phaeodactylum more closely resembled C-4 plants which have low rates of photorespiration. The test results showed increased oxygen inhibition at reduced bicarbonate concentrations. The Phaeodactylum biochemical mechanism of photorespiration appeared similar to that of other photosynthetic systems. The ribulose-1,5-diphosphate carboxylase activity in cell-free extracts was also inhibited by oxygen. Oxygen inhibition and ribulose-1,5-diphosphate-dependent oxygen uptake were optimal at pH 9.2. Ribulose-1,5-diphosphate carboxylase to oxygenase ratios decreased with increasing pH and were higher in cells grown under lower light intensities. Carboxylase levels were less affected by light intensity for growth than oxygenase levels. The short-term incorporation of sodium bicarbonate-carbon-14 by cells grown at high light intensities showed increased labeling of glycolate and glycine plus serine under oxygen compared to nitrogen. Radioactivity decreased concomitantly in phosphoglyceric acid and sugar phosphates in the presence of oxygen. Oxygen effects on the short-term pattern of photosynthesis were less marked when the alga had been previously grown at low light intensities. (Buchanan-Davidson--Wisconsin)

WATER POLLUTION INVESTIGATION: MAUMEE RIVER AND TOLEDO AREA,
Enviro Central, Inc., Rockville, Md.
J. Horowitz, J. R. Adams, and L. A. Bazel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-242 287, $7.50 in paper copy, $3.00 in microfiche. Report EPA-905/9-74-018, January 1975. 185 p. 24 fig., 19 tab., 2 append. EPA 68-01-1567.

Descriptors: *Water pollution, *Ohio, *Rivers, *Estuaries, *Water pollution control, Dissolved oxygen, Hydrologic aspects, Runoff, Treatment facilities, Coliforms, Lake Erie, Water levels, Agricultural runoff, Sewage treatment, Sediment load, Monitoring, Bottom sediments, Effluents, Sampling, Water quality standards.
Identifiers: *Maumee River(Ohio), *Toledo(Ohio).

The combination of hydraulic factors, the historical changes in land use, the runoff sediment load, agricultural runoff, malfunctioning sewers and sewage treatment plant operations, thermal pollution, and Lake Erie water level fluctuations contribute to the gross pollution of the Maumee River estuary in the vicinity of Toledo, Ohio. Among the recommendations suggested to improve the estuary's water quality are that research be instituted of the hydraulics and sediment dynamics of the estuary, as a basis of wasteload quality allocations. Sampling methods must consider the major features of estuarine behavior--stratification, flow reversals, and irregular times of passage. Sample preservation and analysis should be drastically improved and the monitoring programs coordinated. Water quality standards for the lower Maumee and its tributaries must be clarified and more precisely defined; especially the 'ammonia' standard should be restated to delineate ammonium and ammonia. Sewers and sewer regulators should be repaired immediately to eliminate the floating filth and bubbling sludge beds in the river. The thermal outfall should be carefully controlled when the river's DO is low; and that the DO standard of 5 mg/l in the vicinity of the outfall be reconsidered. The water quality standards should be revised to reflect the

diversity of the various watercourses in the area and of their varying potential for improvement. (Auen-Wisconsin)

WATER POLLUTION INVESTIGATION: ERIE, PENNSYLVANIA AREA,
Betz Environmental Engineers, Inc., Plymouth Meeting, Pa.
F. X. Browne.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 628, $7.50 in paper copy, $3.00 in microfiche. Report EPA-905/9-74-014, March 1975. 206 p. 18 fig., 13 tab., 29 ref., 3 append. EPA 68-01-1578.

Descriptors: *Water pollution sources, *Water pollution control, *Pennsylvania, *Lake Erie, Thermal pollution, Tributaries, Industrial wastes, Sewage effluents, Treatment facilities, Water pollution effects, Sewerage, Water quality, Bottom sediments, Plankton, Oil pollution, Heavy metals, Storm drains, Monitoring, Physical properties, Bacteria, Chemical properties, Biological properties.
Identifiers: *Erie(Pa), *Presque Isle Bay(Pa), Garrison Run(Pa), Mill Creek(Pa), Penn Central RR Yards.

Water quality in Presque Isle Bay and Lake Erie near Erie, Pennsylvania, is relatively good, except for high levels of total and fecal coliform bacteria. A few localized areas of degraded water quality were identified. Hammermill Paper Company waste water discharges are pigmented. Heated condenser discharges from the Pennsylvania Electric Company have recirculated into the bay, causing annual dieoffs of gizzard shad. Cascade Creek, Mill Creek, and Garrison Run are polluted. Mill Creek contributes the highest pollution load, followed by Cascade Creek and Garrison Run, based on water quality determinations and flow estimates. Minimal yard operations are being performed by Penn Central, but some areas are impregnated with oil which is sometimes picked up by stormwater. Water quality at Beach 11 on Presque Isle Bay may be adversely affected by filling the area adjacent to Koppers Company with lake dredge materials. Monitoring of physical, chemical, and biological parameters, and flow of the three tributaries should be continued in order to define the magnitude, causes, and effects of water quality problems. Temporal and spatial trends should be identified. Illegal sanitary and industrial connections should be eliminated. The Hammermill Paper Company should reduce their wastewater discharges. Penn Central should initiate an oil spill prevention and clean-up program. (Buchanan-Davidson--Wisconsin)

THE INFLUENCE OF LAND USE ON STREAM NUTRIENT LEVELS,
Corvallis Environmental Research Lab., Oreg. Eutrophication Survey Branch.
J. M. Omernik.
Report EPA 600/3-76-014, January 1976. 114 p. 29 fig., 8 tab., 31 ref., 1 append.

Descriptors: *Watersheds(Basins), *Land use, *Runoff, *Nutrients, *Mathematical models, Urban runoff, Agricultural runoff, Forest watersheds, Phosphorus, Nitrogen, Streams, Streamflow, Flow rates, Eutrophication, Surveys, Forecasting, Hydrogen ion concentration, Equations, Regression analysis.
Identifiers: Non-point nutrient sources, National Eutrophication Survey.

Drainage area characteristics and stream nutrient runoff data for 473 non-point source-type drainage areas in eastern United States were analyzed based on the National Eutrophication Survey data. Higher nutrient concentrations were found in streams draining agricultural rather than forested watersheds. Nutrient concentrations were generally proportional to percent of agricultural land. Mean total phosphorus concentrations were nearly ten times greater and mean total nitrogen concentrations five times greater in streams draining agricultural rather than forested areas. Inorganic nitrogen increased from about 27% in streams draining forested areas to over 75% in streams draining agricultural watersheds. Orthophosphorus was always about 40% of total phosphorus contents. Differences in nutrient loads were not as pronounced as differences in nutrient concentrations in streams in different land use areas, mainly due to differences in areal streamflow, mean annual precipitation patterns, and mean slope of study areas. The most accurate method of predicting export values or stream loads was to use models for stream nutrient concentrations and multiply by flow. Regression analyses of the combined percentages of agricultural and urban land uses against both the total and inorganic forms of phosphorus and nitrogen were performed. Equations for these analyses, together with maps illustrating the equations' residuals, offer a limited predictive capability and some accountability for regional characteristics. (Buchanan-Davidson--Wisconsin)

PLANT PRODUCTION IN EXPERIMENTAL STREAMS, A COOPERATIVE RESEARCH PROJECT WITH WEYERHAEUSER COMPANY,
Oregon State Univ., Corvallis. Dept. of Botany and Plant Pathology.
D. E. Busch, and C. D. McIntire.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 606, Price codes: A02 in paper copy, A01 in microfiche. Completion Report WRRI-45, September 1976. 17 p, 6 fig, 7 ref. OWRT A-035-ORE(1).

Descriptors: *Plant growth, *Energy budget, *Nutrients, *Primary productivity, Herbivores, Algae, Industrial wastes, Ecosystems, Trophic level, Washington, Light, Biomass, Eutrophication, Nitrogen, Chlorophyll, Periphyton, Invertebrates, Standing crops, Algal control.
Identifiers: Bioenergetics, Carnivores.

The general objective is to determine the effects of nutrient enrichment and other environmental changes on rates of primary production and on the structure of algal communities in experimental streams. Nutrient enrichment-primarily nitrogen will simulate introductions related to forest management policies practiced by Weyerhaeuser Company, Longview, Washington, namely forest fertilization and nutrient introductions resulting from logging activities. The project was designed as a sequence of two experiments, designated the winter and summer experiments. The winter experiment involved reducing light intensity, while the summer experiment was concerned with nutrient (nitrate) enrichment at different light intensities. The recovery of the stream system after the catastrophic reduction of biomass in the riffles was characterized by a rapid accumulation of algae and invertebrates. Measures are presented of total biomass (ash free dry weight), algal standing crop (chlorophyll a concentration), and animal standing crop (dry weight estimated from observed body size). These patterns of accumulation do not indicate a steady, continual increase in living material with distinct differences between streams receiving different intensities of light. Total biomass exhibited an increase, decrease, and subsequent increase after the perturbation for both the shaded and unshaded streams. This pattern was also observed in the estimates of algal density in the riffles. However, the unshaded riffles showed a faster accumulation of algae than the shaded riffles during the first 70 days. Standing crop of invertebrates differed from this pattern. Invertebrate biomass increased and then gradually decreased in both streams during the experiment. The patterns of algal, invertebrate, and total biomass represented biological responses to an increase of resources. The removal of biomass i creased a critical resource (space) for periphy algae under constant physicochemial conditio The subsequent accumulation of algae increas the food resource for the invertebrates. Grazi reduced algal density, and reduced algal densi supported a lower invertebrate standing crop. E mates of herbivore and carnivore biomass dicated herbivore response to algal increase f lowed by carnivore response to herbivore crease.

Identifiers: Terpenes, Diterpenes, Resin acids.

Foam collected from two aerated lagoons treat kraft pulp effluents was highly toxic to juve sockeye salmon (Oncorhynchus nerka). Bioass of the fish demonstrated that the toxicity of foam was contained in the methanol-soluble fr tion. Chemical fractionation of one foam revea large amounts of toxic resin acids and neu diterpenes. In the other foam, toxicity was rela to a nonionic surfactant pitch dispersant unidentified material. The foam containing to resin acids and neutral diterpenes was 1000 ti more toxic to salmon than bleached kraft mill fluent. Neither foam was readily detoxified biological treatment in the laboratory. The che cal and physical characteristics of each foam tabulated in detail. (Kreager-FIRL)

FFECTS OF SEDIMENTATION ON COASTAL ONE ORGANISMS,
ew York Univ. Medical Center, N. Y. Lab. for vironmental Studies.
M. O'Connor, and J. A. Sherk.
: Proceedings of the Third Federal Inter-Agency dimentation Conference, 1976; Denver, olorado, March 22-25, 1976. Water Resources ouncil, Washington, D. C., Sedimentation Comttee, p 6-1 - 6-16, 1976. 45 ref.

escriptors: *Sedimentation, *Biology, *Coasts, fineral industry, Water pollution, Effects, ological communities, Marine biology, Fish, enthic fauna, Zooplankton, Sediments, redging, Waste disposal, Turbidity, Estuaries, spended solids, Shores, Phytoplankton.
entifiers: *Sedimentation effects, Coastal zone.

me direct and indirect effects of sedimentation coastal zone organisms were identified and scussed with respect to future increases in exoitation of coastal zone mineral resources (sand d gravel mining, oil and gas extraction), conuction, dumping (sewage sludge, dredged aterial, demolition debris), and dredging. It was ncluded that the potential biological effects of rticulate organic and inorganic material which s been suspended, resuspended, and deposited the coastal zone will depend at least upon (1) ncentration, (2) composition (mineral types, rticle sizes and shapes), (3) sorbed minerals, xins, or other associated substances, and (4) lerances of the organisms. Tolerance limits ensitivities) of organisms to sedimentation can ffer with respect to trophic level, life stage, feedg mechanisms, habitat preference (mud-water terface, shoal water, open water) and duration of posure. At coastal zone sites selcted for sedientation changes, an appropriate basis for preoject decision making could be provided by entification of the most sensitive biological comnents (important species and life stages) and an equate knowledge of local conditions. HEMICAL AND BIOLOGICAL MOBILIZAON OF HEAVY METALS FROM ESTUARINE DIMENTS,
rps of Engineers, San Francisco, Calif. South cific Div.
H. Wakeman.
Proceedings of the Third Federal Inter-Agency dimentation Conference, 1976; Denver, olorado, March 22-25, 1976. Water Resources ouncil, Washington, D. C., Sedimentation Comttee, p 6-17 - 6-27, 1976. 11 ref.

Descriptors: *Sediments, *Heavy metals, Biology, *Estuaries, Dredging, Chemical reactions, *Biological communities, Suspended solids, Cadmium, Lead, Zinc, Copper, Chemistry, Water pollution, Waste disposal, Pollution.
Identifiers: *Biological reactions.

The recent emphasis on estuarine pollution has culminated in a series of Federally funded research programs to identify the mechanisms involved in the movement of heavy metals from the sediment reservoir into the biosphere. The U. S. Army Corps of Engineers, San Francisco District, as part of its Dredge Disposal Study, is conducting experiments both in the laboratory and in the field to evaluate the possible influence of dredging operations on mobilization of heavy metals, and their ultimate uptake and accumulation by estuarine biota. Investigations have shown that cadmium, lead, zinc, and copper can be emitted from resuspended San Francisco Bay sediments under oxygen rich conditions. Biological investigations have shown that dissolved heavy metals ions can be accumulated during low salinity periods and desorbed as the salinity increases. Field studies have shown that estuarine organisms will accumulate heavy metals during periods of high urban runoff. Heavy metals may be taken up and accumulated by organisms following dredging activities via chemical reactions in the water column causing increased ambient concentrations or by ingesting and breaking down organic matter containing metals. BIOLOGICAL EFFECTS OF HEAVY METALS ON JUVENILE BAY SCALLOPS, ARGOPECTEN IRRADIANS, IN SHORT-TERM EXPOSURES,
National Marine Fisheries Service, Milford, Conn. Middle Atlantic Coastal Fisheries Center.
D. A. Nelson, A. Calabrese, B. A. Nelson, J. R. MacInnes, and D. R. Wenzloff.
Bulletin of Environmental Contamination and Toxicology, Vol. 16, No. 3, 1976, p 275-282, 3 tab, 23 ref.

Descriptors: Environmental effects, *Heavy metals, *Mollusks, *Cadmium, *Silver, *Mercury, *Arsenic, *Mortality, *Respiration, Toxcity, Water pollution effects.
Identifiers: Argpecten irradians.

The purposes were to determine the acute effect of arsenic, cadmium, mercury, and silver on survival of juvenile bay scallops after 96 hours of exposure, to investigate tissue uptake of these metals, and to determine changes in oxygen consumption rates in scallops exposed to the estimated LC5 and LC25 values of silver and cadmium as determined from the acute toxicity studies. 95% mortality was seen with silver concentrations of 0.086 ppm, mercury at 0.150 ppm, cadmium at 2.33 ppm, and arsenic at 5.41 ppm. 50% mortality values were 0.033 ppm for silver, 0.089 ppm for mercury, 1.48 ppm for cadmium, and 3.49 ppm for arsenic. Results indicated that scallops exposed to the LC5 and LC25 levels of cadmium exhibited significantly higher oxygen consumption rates than the controls. Scallops exposed to silver at the LC25 level respired at a higher rate but those at the LC5 level respired at a slightly lower rate. Results indicated that scallops can rapidly accumulate high levels of metals in their body tissues. (Chilton-ORNL)

ACCUMULATION AND DISTRIBUTION OF SELENIUM IN MUSSEL AND SHRIMP TISSUES,
International Lab. of Marine Radioactivity Monte Carlo (Monaco). Oceanographic Museum.
S. W. Fowler, and G. Benayoun.
Bulletin of Environmental Contamination and Toxicology, Vol. 16, No. 3, 1976, p 339-346, 4 fig, 1 tab, 16 ref.

Descriptors: Environmental effects, *Selenium, *Mussels, *Shrimp, *Bioassay, Heavy metals, Toxicity, Water pollution effects, Absorption.
Identifiers: Tissue accumulation, Exoskeleton.

One group of mussels and shrimps was maintained in sea water containing 0.8 microCi/l high specific activity Se 75. Another group, maintained in flowing sea water, was fed ad libitum mussels that had previously accumulated Se 75 from sea water. The third group was analyzed to assess tissue distribution of stable selenium in animals considered to be at equilibrium with this element in their environment. The highest concentrations in shrimp tissues of selenium accumulated from water were found in the exoskeleton. Molts contained from 60 to 90% of the total Se 75 body burden. When uptake occurred via the food chain, the highest activity was found in the visceral tissues but the high level of Se 75 associated with the exoskeleton attests to the fact that ingested selenium is readily translocated from internal to external tissues. The relative order of stable selenium in shrimp tissues showed that viscera displayed the highest, eyes and exoskeleton intermediate, and muscle the lowest concentrations. In mussels, the mantle had the highest stable selenium concentration of any tissue analyzed and the lowest degree of uptake in the tracer study. (Chilton-ORNL)

UPTAKE AND RELEASE OF PHOSPHORUS BY PHYTOPLANKTON IN THE CHESAPEAKE BAY ESTUARY, USA,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. L. Taft, W. R. Taylor, and J. J. McCarthy.
Marine Biology, Vol. 33, 1975, p 21-32, 3 fig, 6 tab, 46 ref. AT(11-1)-3279.

Descriptors: *Metabolism, *Phytoplankton, Plant physiology, *Phosphorus, *Phosphates, Membranes, On-site investigations, *Absorption, *Chesapeake Bay.
Identifiers: *Excretion.

Uptake and release rates for inorganic phosphate, dissolved organic phosphate and polyphosphate by phytoplankton were estimated during 5 cruises covering a 9 month period of time. The time for phophorus turnover in all pools ranged from several minutes to 100 h. Each soluble pool appeared to contain fractions which were metabolically useful to phytoplankton. At low soluble reactive phosphorus concentrations, the uptake rate of trace P 32 orthophosphate was initially rapid, but declined after 15 to 60 min. incubation. The common shape of the P 32 orthophosphate uptake curves suggests that the initial rapid rate of uptake and subsequent reduced rate represent different phenomena. It was suggested that either the entire curve represents net uptake which slows with experiment duration as the level of available orthophosphate approaches the uptake limiting concentrations or that the initial uptake represents exchange across the cell membrane and only the subsequent reduced rate is net uptake. THE EFFECTS OF TEMPERATURE AND HYDROSTATIC PRESSURE ON ENZYMES OF AN ABYSSAL FISH, ANTIMORA ROSTRATA: LIVER NADP-LINKED ISOCITRATE DEHYDROGENASE,
Ottawa Univ. (Ontario). Dept. of Biology.
T. W. Moon, and K. B. Storey.
Compilations in Biochemistry and Physiology, Vol. 52B, p 51-57, 1975 7 fig, 2 tab, 24 ref.

Descriptors: Environmental effects, *Temperature, *Hydrostatic pressure, Fish, Benthos, *Enzymes, Water pollution effects.
Identifiers: Enzyme activity, *Antimora rostrata.

NADP-linked isocitrate dehydrogenase was isolated from the liver of the benthic fish Antimora rostrata. Investigation showed that, at high isocitrate concentrations, enzyme activities were moderately affected by pressure increases of up to 12000psi. The enzyme activities were very temperature sensitive below 12C. The enzyme activity was inhibited at high concentrations of the reduced pyridine nucleotides, NADH and NADPH. Physiological pressure and temperature conditions enhanced the activity of NADH and NADPH at low concentrations. Guanosine-triphosphate and alpha ketoglutarate also acted as modifiers of IDH activities. It was concluded that these modifiers were responsible for reducing the pressure and temperature sensitivities of this enzyme and that they implicate the importance of this enzyme in cellular metabolism. THERMAL STRESS FOR HEXADECANE DECOMPOSITION IN SEAWATER OF A NATURAL ENVIRONMENT,
Tokyo Univ. (Japan). Ocean Research Inst.
H. Seki.
La mer, Vol. 13, No. 2, p 53-57, May 1975 2 fig, 2 tab, 11 ref.

Descriptors: Environmental effects, *Temperature, Biochemistry, Biodegradation, *Thermal stress, Microorganisms, Sea water, *Chemical degradation, Asia.
Identifiers: *Hexadecane decomposition, Japan.

The thermal alteration of microbial activity was studied on hexadecane decomposition by microorganisms in salt water of a natural pool of Shimogamo Hot Spring. A significant linear relationship existed between the logarithm of the in situ potentiality of hexadecane decomposition and temperature. The regression line was determined statistically within the temperature range of 42.8 - 63.9C in the pool. The rate of hexadecane decomposition in salt water of the pool was approximately 10 microg hexadecane/1/hr. (Chilton-ORNL)

THE TEMPERATURE OF TWO WELSH LAKES AND ITS EFFECT ON THE DISTRIBUTION OF TWO FRESHWATER INSECTS,
University Coll. of North Wales, Bangor. Dept. of Zoology.
J. E. Brittain.
Hydrobiologia, Vol. 48, No. 1, 1976, p 37-49, 1 fig, 25 ref.

Descriptors: Environmental effects, *Temperature, *Lakes, Freshwater, *Distribution, Insects, Mayflies, Stoneflies, *Aquatic insects, Water pollution effects.
Identifiers: *Wales.

Over a two year period of the study, temperature regimes in the littoral zones of two lakes in North Wales were found to be similar despite the different situations of the two lakes. Although regional weather factors seemed to be of more importance than local variations it was noted that in warm anticyclonic summer weather when water temperatures exceeded 20C during the day the temperature fell to below 20C in Llyn Dinas during the night, while Llyn Coron often remained above 20C throughout the night. Two common species, Nemoura avicularis Morton and Leptophlebia vespertina (L.), in Llyn Dinas were absent from Llyn Coron. Investigations of nymphal temperature tolerance and the effect of temperature on egg development and emergence led to the conclusion the differences in temperature regime between the two lakes were insufficient to explain the absence of the two species from Llyn Coron. HYDRAZINE DEGRADATION IN AQUATIC SYSTEMS,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
A. R. Slonim, and J. B. Gisclard.
Bulletin of Environmental Contamination and Toxicology, Vol. 16, No. 3, 1976, p 301-309, 6 tab, 9 ref.

Descriptors: *Chemical degradation, Aquatic environment, Water pollution effects, Fish, Analytical techniques, Organic matter, Biodegradation, Pollutant identification.
Identifiers: *Hydrazine degradation.

A polarographic technique was developed to determine if hydrazine is stable or degrades in various types of aquatic systems. Three experiments reported consisted of analyzing hydrazine in water from very dirty water filled with much organic debris following a rainstorm to clear, softened municipal water. Addition of hydrazine showed that, within the first couple of hours, the most polluted water caused a hydrazine breakdown to below one-third of its original level. The rate of degradation was highest within the first 24 hours in those samples showing immediate change in hydrazine content, and the hydrazine concentration approached its lowest level on the second day. Clear, soft water containing no organic matter did not degrade hydrazine until the second day and only about 35% by the fourth day. To investigate the extent to which hydrazine is taken up by fish, hydrazine concentration was compared between water samples with and without guppies. In hard water, differences between the samples increased with time while no detectable difference was found in soft water. (Chilton-ORNL)

SEASONAL TEMPERATURE EFFECTS AND PREDICTING DEVELOPMENT RATES OF MARINE COPEPOD EGGS,
Washington Univ., Seattle. Dept. of Oceanography.
M. R. Ladry.
Limnology and Oceanography, Vol. 20, No. 3 May 1975, p 434-440, 3 fig, 1 tab, 20 ref.

Descriptors: Environmental effects, *Temperature, *Seasonal, *Marine animals, *Growth rates, Eggs, *Copepods, *Forecasting, Resistance, *Heat resistance.
Identifiers: Acclimation temperature, *Acartia clausi eggs.

The purpose was to show that the development of Acartia clausi eggs is affected by seasonal temperature acclimation of the female copepod. Eggs from animals collected at 8-10C showed significantly faster development rates under conditio of 15-20C than did those collected at 18-20C. It suggested that when temperature acclimation a tolerance effects are considered, the relative e development of arctic and temperate mari copepods follows the same temperature depende function rather than individual unique functio (Chilton-ORNL)

REVEALING CERCARIA OF THE FAMI SCHISTOSOMATIDAE IN THE KIEV WAT RESERVOIR, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instyt Hidrobiologii.
M. I. Chernogorenko.
Med Parazitol Parazit Bolezn 44(2), p 222-2 1975.

Descriptors: Reservoirs, *Trematodes, Inv tebrates, *Worms, *Animal parasites, *Mollus Larvae, Fish diseases.
Identifiers: Bilharziella-polonica, Coretus, Ly naea-stagnalis, Physa, Rudix, *Schistosomatid Trichobilharzia-ocellata, Ukrainian-SSR, *K Reservoir(USSR).

High rates of mollusc infestation with tremato larvae of the family Schistosomatidae were served in the 1st years of existence of the K water reservoir (Ukrainian SSR, USSR). In s sequent years it decreased considerably due decreased parasite density as a result of decrea water levels and drainage of shallow waters. T maximum excretion of Trichobilhazgia ocell cercariae from molluscs Lymnaea stagnalis occ in the morning and evening hours. Bilharzi polonica, Rudix, Coretus and Physa were a found.—Copyright 1976, Biological Abstracts, I

DIVERSITY OF MARINE INVERTEBRATES A THERMAL EFFLUENT,
Delaware Univ., Lewes. Coll. of Marine Studies
D. T. Logan, and D. Maurer.
Journal Water Pollution Control Federation, V 47, No. 3, March 1975, p 515-523, 5 tab, 2 fig, ref.

Descriptors: *Environmental effects, *Ther pollution, *Marine animals, Temperature, Hea water, Water pollution effects, Invertebrates.
Identifiers: *Species diversity.

It has been hypothesized that species diver may be used to determine the effect of a pollut on a community with pollution tending to red the value of the diversity index. Data from study show that an area of unusually high diver may exist in a thermal effluent at the mouth discharge canal. A suggested explanation for condition is that the mouth of the discharge c is subject to large temperature variations. If a l portion of the community at this location destroyed during intermittent, severe temperat changes, the ensuing periods of more stable co tions will be periods of recolonization and th will be little species interaction. No species have gained dominance through interaction diversity may be unusually high in these pio communities. (Chilton-ORNL)

SEASONAL AND LABORATORY VARIATI IN THE HEALTH OF GRASS SHRI PALAEMONETES PUGIO: DODECYL SOD SULFATE BIOASSAY,
Army Engineer Waterways Experiment Stat Vicksburg, Miss. Environmental Effects Lab.
H. E. Tatem, J. W. Anderson, and J. M. Neff.
Bulletin of Environmental Contamination Toxicology, Vol. 16, No. 3, 1976, p 368-375, 2 21 ref.

escriptors: Environmental effects, *Toxicity, esistance, *Shrimp, Laboratory tests, Organic mpounds, *Bioassay, Temperature, Salinity, asonal, Water pollution effects.
entifiers: Dodecyl sodium sulfate, DSS, laemonetes pugio.

e purpose was to determine the seasonal varia- n in the resistance of grass shrimp to dodecyl dium sulfate (DSS) and the organism's response DSS after time in the laboratory. Data indicated t grass shrimp tolerated substantial concentra- ns of DSS in comparison to marine fish and staceans. Palaemonetes tolerated higher levels DSS when collected in spring and summer nths and showed significant decreases in re- tance to the standard toxicant with time in the oratory even while appearing normal and althy. Results suggested that toxicity testing uld be begun as soon as possible after organ- s are collected, with temperature and salinity rameters similar to field conditions. (Chilton-RNL)

IE RELATIONSHIP OF MALATHION AND S METABOLITES TO FISH POISONING,
vironmental Protection Agency, Gulf Breeze, a. Gulf Breeze Environmental Research Lab.
H. Cook, J. C. Moore, and D. L. Coppage.
lletin of Environmental Contamination and xicology, Vol. 16, No. 3, 1976, p 283-290, 3 tab, ref.

escriptors: Environmental effects, *Pesticides, sh, Metabolism, *Bioassay, Enzymes, ochemistry, Laboratory tests, Mortality, oxicity, Water pollution effects, Pollutant ntification, Monitoring.
entifiers: *Malathion, Malaoxon.

e purpose was to determine the relation of ort-term measurability of malathion and some of metabolites in fish to poisoning of fish in the oratory. Degree of poisoning was determined brain acetylcholinesterase inhibition and deaths exposed populations. Residues of malathion or laoxon were not found in any body tissue in ncentrations greater than 0.10 microg/g after 24 exposure to 75 microg malathion/l. However, lathion monoacid and diacid were found in all sues with the greatest residues in gut and liver, licating rapid conversion of malathion to other mpounds. The data showed accumulation of noacid in the gut that coincided with phosphor- tion of acetylcholinesterase in brain and isoning in short-term continuous exposure to atively constant levels of malathion in seawater. was concluded that monitoring by chemical alyses of sensitive fishes or water for malathion malaoxon would not show poisoning caused by zyme-bound metabolites but that analysis for lathion monoacid in gut and measurement of in acetylcholinesterase activity in fish would be practical measure of poisoning caused by lathion. (Chilton-ORNL)

IE EFFECT OF GRAVEL DREDGING ON ESERVOIR PRIMARY PRODUCTION, IN- RTEBRATE PRODUCTION, AND MUSSEL ODUCTION.
nnessee Wildlife Resources Agency, Nashville.
Yokley, Jr., and C. H. Gooch.
mpletion Report, August 1976. 38 p, 14 fig, 4 . PL88-300, Proj. 2-245-R.

scriptors: *Water pollution effects, *Dredging, eservoirs, *Gravels, *Mussels, *Aquatic life, diments, *Primary productivity, Invertebrates, ennessee River.
entifiers: Substrates.

e objectives of this study were to find those thods and organisms that reveal best the effects gravel dredging on the biotic communities. The resilience of the Tennessee River is not the same along its length nor are the organisms equally capable of bouncing back to their original densities. Plankton appears to be least affected by the gravel dredging when comparing those organisms studied. Also the fast moving water continually restores the lost plankton almost immediately after it is lost. Recruitment of any lost plankton occurs very quickly. The macrobenthos, including arthropods, annelids, flatworms, and coelenterates are also quickly replaced from surrounding populations as colonization or artificial substrates indicates, but silt does reduce the densities of these organisms below dredging. Freshwater mussels are sedentary and have low resilience requiring much longer time to bounce back. Many of the fish species that serve as hosts to freshwater mussels are not tolerent to silt. The ecological role of mussels has not been completely evaluated but it is known that the quality of water they inhabit is usually good. Mussels do filter suspended or organic matter from the water and improve its quality for fish and other swimming forms. (NOAA)

AN ECONOMIC ANALYSIS OF THE ENVIRONMENTAL IMPACT OF HIGHWAY DEICING,
Abt Associates, Inc., Cambridge, Mass.
D. M. Murray, and U. F. W. Ernst.
Report EPA-600/2-76-105, May 1976. 137 p. 15 fig., 8 tab., 331 ref., 2 append. 68-03-0442.

Descriptors: *Snow removal, *Salts, *Highway icing, *Costs, *Damages, Water supply, Trees, Bridges, Corrosion, Groundwater, Public health, Water pollution effects, Cost comparisons, Air pollution.
Identifiers: *Highway deicing, Automobile corrosion.

The effects of salt use for highway deicing and snow removal on water supplies, lakes, and rivers; on trees and other vegetation; on bridges; on vehicles; on underground power transmission lines; and on public health are discussed. By analyzing available data it is estimated that the minimal an-

nual costs of salt use to the snowbelt states approximates $3 billion, distributed as follows: Surface and groundwater water supplies with the potential for irreversible public health damage to the hypertension-sensitive segment of the population - $150 millions; vegetation - $50 millions; highways and bridges - $500 millions; vehicles - $2000 millions; underground power transmission lines - $10 millions; and salt purchases and application - $200 million. The damage cost is almost 15 times the annual national budget for the purchase and application of road salt, and about six times the entire annual national budget for snow and ice removal. It is recommended that the level of salting be reduced by an amount determined by local conditions and that greater emphasis should be placed on plowing and sanding snow removal methods. Educational programs should be instituted to alert the public to the extent of salt damage and greater emphasis should be placed on driver training under winter conditions. (Auen-Wisconsin)

CLADOPHORA IN THE GREAT LAKES,
Limnos Ltd., Toronto (Ontario).
J. Neil.
International Joint Commission, Great Lakes Research Advisory Board, Workshop Proceedings, February 19-21, 1975, Windsor, Ontario, H. Shear and D. E. Konasewich, editors. 188 p.

Descriptors: *Chlorophyta, *Cladophora, *Great Lakes, *Conferences, *Nuisance algae, History, Habitats, *Distribution, *Biomass, Photosynthesis, Phosphorus, Nitrogen compounds, Economic impact, Beneficial use, *Standing crops, Remote sensing, *Productivity, *Nutrient requirements, Food chains, Chemical properties, Radioisotopes, Heavy metals, *Absorption, Pesticides, Bioassay, Growth rates, Niches, Ecology, *Algal control, Nutrient removal, Harvesting, Chemcontrol, Biocontrol, International Joint Commission.

Everything you want to know about Cladophora--its history in the Great Lakes, distribution, biomass standing crop and production, its ecological and chemical requirements, its growth rates in response to temperature, its uptake and accumulation of cations, and its nutrient requirements--are discussed in this workshop proceedings. Presentations also relate to Cladophora's propensity to accumulate heavy metals, pesticides, and radionuclides and the effects of that uptake on the food chain, the possible utilization of this bioaccumulation as a pollutant removal agent, and as a bioassay eutrophication indicator. Also detailed are the ecology of the Cladophora niche, and effectiveness of control methods, including phosphorus limitation, physical removal, chemical and biological control. The socio-economic impact of this nuisance algae is related to impaired water use, reduction of recreation value, devaluation of property, and effects on fisheries. Potential beneficial uses of Cladophora may be as animal fodder, as fertilizer and mulch, utilization of its biocidal products, as a fiber for paper-making, and for treating waste effluents containing low levels of heavy metals and radioactive substances. AN APPROACH TO A RELATIVE TROPHIC INDEX FOR CLASSIFYING LAKES AND RESERVOIRS. (A PRELIMINARY ANALYSIS OF NATIONAL EUTROPHICATION SURVEY DATA COLLECTED DURING THE 1972 SAMPLING PERIOD).
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-242 336, Price codes: A04 in paper copy, A01 in microfiche. Working Paper No. 24, December 1974. 44 p, 1 fig, 6 tab, 10 ref, append.

Descriptors: *Trophic level, *Lakes, *Classification, Phosphorus, Nitrogen, Secchi disks, Chlorophyll, Dissolved oxygen, Methodology, *Reservoir.
Identifiers: *Trophic index system.

A lake Trophic State Index, incorporating the parameters of total phosphorus, dissolved phosphorus, inorganic nitrogen, Secchi disc, minimum dissolved oxygen, and chlorophyll-a, and ranging from 0 to 594 was developed to classify 209 lakes and reservoirs in the northeast and north-central states by using the data collected by the National Eutrophication Survey. Lakes with a Trophic Index Number of 500-594 were oligotrophic while those with an index number of 420-499 were mesotrophic. Below an index number of 420, the lakes became progressively more eutrophic with the lower index numbers corresponding to a higher potential for developing nuisance algae. Lakes in which the eutrophication problem is primarily aquatic macrophytes generally do not fit this index system; however, this is generally true of similar classification systems. For phosphorus limited lakes, the proposed Trophic Index Numbers correspond well to Vollenweider's (1973) phosphorus loading-lake morphometry-trophic state relationships. The proposed index system provides a relative method by which previously unclassified lakes could be classified after the appropriate parameters have been measured. The index could also be used to evaluate year to year changes in trophic conditions of a specific lake. The applicability of this index to lakes in other geographical areas is questionable. (Auen-Wisconsin)

NITROGEN AND PHOSPHORUS IN WASTEWATER EFFLUENTS. (A PRELIMINARY ANALYSIS OF NATIONAL EUTROPHICATION SURVEY DATA COLLECTED DURING 1972-73 SAMPLING PERIOD).
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-242 335, Price codes: A06 in paper copy, A01 in microfiche. Working Paper 22, July 1974. 80 p. 6 tab., 5 ref., append.

Descriptors: *Eutrophication, *Sewage effluents, *Nitrogen, *Phosphorus, Surveys, Alabama, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Kentucky, North Carolina, South Carolina, Ohio, Pennsylvania, Tennessee, West Virginia, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, New Hampshire, New Jersey, New York, Rhode Island, Vermont, Virginia, Wisconsin, Sewage treatment.

A survey of sewage treatment plants in 27 states of the eastern third of the United States indicated that the median total phosphorus content in sewage effluents ranged from 3.4 mg/l to 8.8 mg/l. The lowest concentrations were achieved by those states which either had phosphate detergent bans or were using phosphorus removal processes. Median total nitrogen concentrations by state ranged from 10.46 mg/l to 19.10 mg/l. Median P and N loads, based on population served, were 2.2 lbs total P/capita/yr and 6.0 lbs of total N/capita/yr. Those facilities which specifically practiced phosphorus removal had a median total phosphorus concentration of 2.53 mg/l, less than 50% of the median value of conventional treatment processes. Only 54% of the total phosphorus discharged after primary treatment was dissolved ortho-phosphorus whereas following various types of biological treatment, 72-83% of the total was orthophosphorus, which is readily available to algae. Total nitrogen and ammonia nitrogen concentrations were highest in effluents from primary treatment facilities and lowest in oxidation pond effluents. The average N:P ratio in the effluents of all sampled plants was 2.5:1 and the range 1.9:1 to 5.2:1 for different types of treatment processes. There is little potential for controlling eutrophication by nitrogen removal. (Auen-Wisconsin).

MAN'S EFFECT ON THE QUALITY OF OUR WATER,
Central and Southern Florida Control District, West Palm Beach.
J. Browning.
In Depth Report, West Palm Beach, Vol 1, No 2, 1-8, February 1972. 12 p, 2 tab.

Descriptors: *Water pollution, *Urban runoff, Agriculture, *Water pollution effects, *Runoff, Rainfall-runoff relationships, Storm water, Storms, Storm runoff, Water supply, Water sources, Water pollution control, Administrative agencies, Bacteria, Sewerage.

Background material is presented on pollution as it occurs through agricultural, urban, and storm runoff. South Florida's forecast is encouraging in that the Florida Department of Pollution Control has successfully required non-polluting waste disposal. One remaining problem is that urban runoff bacteria levels in street gutters are extremely high. The optimum solution will be to eliminate much of the trash and debris which finds their way into the waterbodies during rainstorms. Agricultural pollution runoff can be controlled through the use of private, small reservoirs. Tables are given which show characteristics of storm water and pollutant levels according to land use types. (Frank-Florida)

he principal ions in the lake were studied as a nction of depth, at various times of the year. nytoplankton was present in large numbers in ake Laffrey (France): up to 1425 individuals/l ear the bottom (30 m). At the surface the nytoplankton population was 885 individuals/l. he phytoplankton was represented principally by sterionella sp. and Fragilaria sp. The forgme is entiful near the surface, while the second ominates at 12-20 m. Pediastrum and Dinobryon . remain localized below 6 m. Synedra abounds the surface and disappears at 4 m, reappearing 20 m. Stephanodiscus sp. appear only at the bot-m, while the peridinians develop between the rface and 30 m. The zooplankton is made up of otifers and crustaceans. The rotifers are generally ound near the top. Asplanchna is absent at the rface but present between 2 and 12 m. Anura sp. re most numerous near the surface; Polyarthra . appears at 10-15 m; Notholca is scarce near the rface and reaches a maximum at 6 m. The rustaceans are regrouped into Cladocera and opepoda; the latter include Cyclopoids, Cala-oids and nauplii stages. A clear predominance of iatoms is reported compared with other plank-onic algae, which shows that the lake has not eached an advanced state of eutrophication.

lentifiers: *Cymodocea-Nodosa, Halopithys-In-rvus, Ulva-Rigida, Y. goslavia, Koper ay(Yugoslavia), Strujnjan Bay(Yugoslavia).

lant biomass data and measures of diversity and milarity of benthic species from transection sam-es of 2 coastal bays in the north Adriatic ugoslavia) are compared and analyzed. Until cently, the bays were floristically and faunisti-lly nearly identical, but one of them is now eavily polluted by raw sewage from the town of oper. Strunjan Bay, representing natural condi-ons, is characterized by a sea grass (Cymodocea odosa) community which covers most of the bot-m to a depth of 8 m, below which a rich infaunal ommunity within the soft clay sediments is ound. In the shallow, heavily-polluted part of oper Bay, C, nodosa has been eliminated and the sulting space is now inhabited by the algae Ulva gida and Halopithys incurvus. The total number species found to a depth of 4 m is reduced to lf of that of the analogous portion of Strunjan ay. The remaining, pollution-tolerant species are presented in huge number up to 20,000 m2, robably largely due to the elimination of preda-rs. The area of maximum pollution is limited to e inner part of Koper Bay. The community com-osition from deeper areas (8-10 m) does not differ from the analogous part of Strunjan Bay.--Copyright 1976, Biological Abstracts, Inc.

GROWTH AND PRODUCTION OF MASS SPECIES OF CHIRONOMIDS (DIPTERA, TENDIPEDIDAE) IN THE VOLGA PRE-DELTA, (IN RUSSIAN),
Kaspiiski Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Astrakhan (USSR).
M. S. Aleksevnina.
Zool Zh 53(5), p 720-727, 1974.

Descriptors: Biomass, *Diptera, Larvae, *Productivity, *Growth rates, Deltas.
Identifiers: Fleuria-Lacustris, Polypedilum-Nubeculosum, *Tendipedidae, *Volga pre-delta(USSR).

Production is calculated for 3 mass species of chironomid larvae in the Volga pre-delta (USSR): Polypedilum nebeculosum, Fleuria lacustris, Chironomus sp. (form semireductus-plumosus). The calculation was based on A.S. Konstantinov's method of summation of relative diurnal increments of larval biomass during a definite period. The production of the species in question was 16.0-34.7 times higher than the average biomass during the same period. The ratio between the production and the maximum biomass (P/B max) attained 2.0-6.8 P. nubeculosum characterized by a short life cycle and high numbers had high values of P/B max (6.8 and 5.3). These values were lower in F lacustris and Chironomus sp. characterized by a slower development rate (2.9 and 3.4, 2.9 and 3.1, respectively). These values match those for eutrophic water bodies. The production of F. lacustris calculated by the graphic method (Vinberg, 1968) agrees with the values obtained.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Biomass, *Lakes, Europe, *Oligochaetes, *Temperature.
Identifiers: Lake Dusia, Lake Galstas, *Lithuanian-SSR, Lake Obelija, *Potamothrix-Hammoniensis, Lake Slavantas, USSR.

The largest number P. hammoniensis Mich. in 1969 and 1970 was in Lake Dusia (Lithuanin SSR, USSR). The number varied in the wide boundary from 600-1400 worms/m2. The smallest number of oligochaete biomass was in Lake Slavantas, especially in 1970. The largest oligochaete biomass was in Lake Dusia which is of average thermal depth. The smallest biomass was in thermal deep Lake Slavantas. The largest average weight (9.55-10.00mg) of P. hammoniensis was in thermally shallow Lake Obelija in Feb. 1968. The largest specimens (20-29 mm in length) were in thermally shallow Lake Obelija and in Lake Dusia. P. hammoniensis comprised the largest part of the zoobenthos (80-90%) in the average lakes and the smallest part of the zoobenthos (15-50%) in thermally shallow Lake Obelija and in thermally deep Lake Slavantas (0.1-24.8%).--Copyright 1976, Biological Abstracts, Inc.

THE TIME AND THE CAUSE OF EXTERMINATION OF LAKE BALLS FROM LAKE ZELLER, (IN JAPANESE),
Yamagata Univ. (Japan). Dept. of Biology.
S. Nakazawa.
Bull Jpn Soc Phycol 22(3), p 101-103, 1974.

Descriptors: *Cladophora, Lakes, Europe, Fishing, Succession, Water pollution, Beaches, Nets.
Identifiers: *Cladophora-Sauteri, *Lakes balls(Cladophora), *Lake Zeller(Austria).

Reports of Sauter, Lorenz, Keissler, a letter of the Mayor Alois Latini of Zell am See, and original investigation of Lake Zeller (Austria) in 1972, were compared. The lake balls of Cladophora sauteri were apparently exterminated from Lake Zeller between 1900-1909. The cause of the extermination may be a combination of several factors: natural succession, change in water by human contamination, loss of shallow beaches by embankment and mechanical damage of the lake bottom by fishing nets.--Copyright 1976, Biological Abstracts, Inc.

STUDIES ON THE INCIDENCE OF ENCYSTED LARVAE OF PARAGONIMUS MIVAZAKII KAMO ET AL, 1961 IN THE CRAB POTAMON DEHAANI IN SHIZUOKA PREFECTURE, JAPAN, (IN JAPANESE),
Shizuoka Univ. (Japan). Hygiene Lab.
J. Ito, and H. Mochizuki.
Jpn J Parasitol 24(4), p 241-249, 1975.

Descriptors: *Human diseases, Asia, Larvae, *Crabs, Water pollution effects.
Identifiers: *Japan, *Paragonimus-miyazakii, *Potamon-dehaani, Shizuoka Perfecture.

Humans have become infected with P. mivazakii due to contact with contaminated P. dehaani. Of 1874 crabs (P. dehaani) collected in Shuizuoka Prefecture, Japan, and examined for metacercariae of P. mivazakii, 275 (14.7%) were positive. The dis-

tribution was limited to the western half of the prefecture. The highest incidence rate found in the Ooi River basin (34.4%); rates were 13.4% in Oota River, 31.7% in Tenryu River and 1.7% in Miyakoda River. The number of cysts per crab host was 1-24, with an average of 3.3. Metacercariae were most often found in the pericardial cavity, usually attached to the heart of the crab. No correlation between infection rate and size or sex of the crab was observed.--Copyright 1976, Biological Abstracts, Inc.

STUDIES ON THE BOTTOM FAUNA OF FIVE LAKES IN SOUTHERN HOKKAIDO (LAKES HIKOTSU-KO, KUTTARA-KO, TOYA-KO, HANGETSU-KO AND OSHIMA O-NUMA, (IN JAPANESE),
Mieken Science Education Center, Yokkaichi (Japan).
N. Kitagawa.
Jpn J Limnol 36(2), p 48-54, 1975.

Descriptors: *Lakes, Asia, *Bottom deposits, Benthos, Mesothropy, Chironomids, Dissolved oxygen, Larvae.
Identifiers: *Chironomus-plumosus, Hangetsu-Ko, Hokkaido, *Japan, Kuttara-ko, Lakes, O-numa, Oshima, Procladius-sp, Shikotsu-ko, Toya-ko, *Tubifex-sp, Profundal zone.

In Lake Shikotsu-ko, only Tubifex sp. occurred in the profundal zone deeper than 350 m. Some kinds of chironomid larvae were found in the littoral zone. The dissolved O2 is rich throughout. In Lake Kuttara-ko, no macroscopic animals were found deeper than 138 m. Tubifex sp. occurred in the zone shallower than 138 m, though not abundant. Transparency was 18 m. This is the highest value of the 9 lakes in Hokkaido (Japan) investigated. In Lake Toya-ko, some kinds of chironomid larvae were found in the littoral zone, but not in the profundal zone. Tubifex sp. occurred widely over the bottom. In Lake Hangetsu-ko, no macroscopic animals were found on the bottom. The deoxygenated layer extends for several meters at the deepest zone. In Lake Oshima O-numa, Chironomus plumosus is dominant in the profundal zone. This lake is a mesotrophic plumosus lake.--Copyright 1976, Biological Abstracts, Inc.

THE PHYSICAL-CHEMICAL CONDITIONS OF THE WATERS OF THE LAKE OF ORTA DURING THE PERIOD FROM 1964 TO 1970, (IN ITALIAN),
F. M. Biffi, M. Picotti, and D. Tajana.
Boll Pesca Piscic Idrobiol 27(1), p 1-42, 1972.

Descriptors: *Lakes, Europe, Epilimnion, Hypolimnion, *Carbon dioxide, Ions, Oxidation, Oxygen, Phytoplankton, Heated water, Hydrogen ion concentration.
Identifiers: *Italy(Lake of Orta).

Thermal inversion in the waters (in Italy) occurs annually in later winter and reaches the greatest depths every year. The oxygenation of the epilimnion is normal; that of the hypolimnion is scanty especially in the period of summer-autumn stratification. The deep layers always show high CO2 content, which decreases at the end of the winter period after the exchange of the deep waters. In the surface layers the CO2 content is fairly normal with a siight increase in the period in which the ascent of the deep water layers occurs. Similar behavior is shown by the pH. NH4 in view of the H+ concentration, is present in ionic equilibrium with anions of the available acids, especially carbonic acid. NO2, as intermediate products of physico-chemical and biological oxidation have a concentration stabilized around 3000 gamma (3000 micro g/l, with a tendency, in recent years, to decrease through phytoplankton consumption. Cu and Cr contents are also given.--Copyright 1976, Biological Abstract, Inc.

DISTRIBUTION OF THE PHYTOPHYLIC INVERTEBRATES AND METHODS OF THEIR QUANTITATIVE ESTIMATION, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
Gidrobiol Zh. (6), p 51-58, 1973.

Descriptors: *Distribution, *Invertebrates, *Zooplankton, Estimating.
Identifiers: Ceriodaphnia-pulchella, Chydorus-sphaericus, Eucyclops-serrulatus, Eurytemora-velox, Glyceria-sp, Polyphemus-pediculus, Potamogeton-sp, Quantitative, Scapholeberis-mucronata, Sida-crystallina, Simocephalus-vetulus, *Phytophylic invertebrates.

Zooplankton occurrence obeys the law of normal distribution. The accuracy of quantitative zooplankton estimation with 9-10 samples taken, when sample volume is convenient, reaches 8-10%. The estimation accuracy depends on the characteristics of the substrate, as well as on biological and ecological zooplankton (Sida crystallina, Simocephalus vetulus, Ceriodaphnia pulchella, Scapholeberis mucronata, Chydorus sphaericus, Polyphemus pediculus, Eucyclops serrulatus, Eurytemora velox) peculiarities, e.g., its ability to form shoal. The irregular distribution of the zooplankton is described by the coefficient of variation. The estimation accuracy increases when the greatest variety of size and ecologically different aggregations, all forming a phytophylic biocenosis, is covered by the survey. (Samples from Glyceriasp., Zander and Potmmogeton sp. were used.).--Copyright 1976, Biological Abstracts, Inc.

DISTRIBUTION AND SIGNIFICANCE OF FECAL INDICATOR ORGANISMS IN THE UPPER CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Microbiology.
G. S. Saylor, J. D. Nelson, Jr.,, A. Justice, and R. R. Colwill.
Applied Microbiology, Vol 30, No 4, October 1975, p 625-638, 7 tab, 8 fig, 13 ref.

Descriptors: *Water pollution effects, *Water quality, Waste water(Pollution), Domestic wastes, Sewage, Environmental effects, Shellfish, Recreation, Temperature, Salinity, Bays, *Chesapeake Bay, *Bioindicators, *Distribution, Coliforms, Bacteria, Enteric bacteria, Streptococcus, Aerobic bacteria.
Identifiers: Heterotrophic bacteria.

The survey reported upon provides evidence of significant levels of pollution from human wastes in the water, sediment, and suspended sediment throughout the Upper Chesapeake Bay. Highest counts of pollution indicator organisms were found at the confluence of the Susquehanna River and the Chesapeake Bay. Organisms were found to be quantitatively distributed independently of temperature and salinity and were not correlated with concentration of suspended sediment. However, 53% of total viable bacteria and more than 80% of fecal indicator organisms were directly associated with suspended sediments. Correlation coefficients for the indicator organisms ranged from 0.80 for bottom water to 0.99 for suspended sediment. Prolonged survival for the fecal streptocci was seen in most of the sediment samples. Further deterioration in water quality would seriously affect shellfish harvesting and recreational uses of the Upper Chesapeake Bay. (Chilton-ORNL)

HYDROGEN ION CONCENTRATION IN THE GASTROINTESTINAL TRACT OF CHANNEL CATFISH,
Georgia Agricultural Experiment Station, Savannah.
J. W. Page, J. W. Andrews, T. Murai, and M. W. Murray.
Journal of Fish Biology, Vol. 8, 1976, p 225-228, 2 tab, 8 ref.

Descriptors: Biochemistry, *Aquatic animals, Fish, *Hydrogen ion concentration, Laboratory investigations, Temperature, *Channel catfish, Water pollution effects.
Identifiers: Gastrointestinal tract(Catfish).

Two groups of five channel catfish, with average weights of 892 and 134 g, were maintained at environmental temperatures of 23 and 28C. Highly acidic conditions were present in the stomachs of all fish with slightly higher pH values for the stomach contents of fish at 28C. The pH values increased to 7-9 in the duodenum and reached a maximum level of 8.6 in the upper intestinal region with a decrease approaching neutrality in the lower segments of the colon. Catfish of both sizes had a slightly lower pH throughout the intestinal tract at 28C than at 23C. The pH of the bile ranged from 6.1 to 7.5 and was higher in fish maintained at 28C. (Chilton-ORNL)

MIXED FUNCTION MONOOXYGENASE OF FISH AS AN INDICATOR OF POLLUTION OF AQUATIC ENVIRONMENT BY INDUSTRIAL EFFLUENT,
Oulu Univ. (Finland). Dept. of Pharmacology.
J. T. Ahokas, N. T. Karki, A. Oikari, and A. Soivio.
Bulletin of Environmental Contamination and Toxicology, Vol. 16, No. 3, 1976, p 270-274, 1 tab, 18 ref.

Descriptors: Environmental effects, Water pollution, *Water pollution effects, Waste water(Pollution), Wastes, Industrial wastes, Fish, Aquatic environment, Enzymes, Pollutant identification, *Bioindicators, *Metabolism, *Pikes.
Identifiers: *Monooxygenase.

The pike (Esox lucius L.) was used to determine whether or not fish in polluted water have a higher in vitro capacity to metabolize foreign compounds than those in clean water. The overall trend, contrary to what had been previously reported, was that the fish from the polluted water showed reduced in vitro mixed function monooxygenase (MFO) capacity. Preliminary exposure studies in which two other species of fish (Salmo trutta lacustris and Salmo gairdneri) were exposed to the polluted water on one and four week periods, did not develop changes such as those seen in pike chronically exposed to the contaminated water. FILTRATION LAGOONS FOR TERTIARY EATMENT OF STABILIZATION POND EF-UENT,
uth Dakota State University, Brookings. Dept. Civil Engineering.
N. Dornbush.
ailable from the National Technical Informa-n Service, Springfield, VA 22161, as PB-259 , Price codes: A03 in paper copy, A01 in crofiche. South Dakota Water Resources search Institute, Termination Report, March 76. 38 p, 3 fig, 4 tab, 6 ref, 3 append. OWRT A-I-SDAK(1). 14-31-0001-5042

scriptors: Suspended solids, Nitrogen com-unds, *Tertiary treatment, *Oxidation lagoons, fluents, *Induced infiltration, Nutrient removal, ater reuse, *Water quality standards, *Waste ter treatment, Water pollution, *Infiltration es, Nitrogen, Phosphorus, Coliforms, ochemical oxygen demand.
ntifiers: *Stabilization ponds, *Infiltration oons, Ammonia nitrogen, Nitrate nitrogen.

iltration lagoons were designed and operated to ke maximum use of an in-place soil system to vide advanced treatment of stabilization pond luents in order to meet future effluent stan-rds. After a three-month period of summer eration of the pilot infiltration-percolation ins, the following preliminary conclusions are ggested. Preliminary lysimeter studies demon-ated that a high degree of treatment was pro-ed by soil filtration although infiltration rates e to two inches per day) in these studies were low to be practical for a full-scale operation. arified pilot infiltration-percolation basins, erated with weekly applications of 18 and 24 hes of stabilization pond effluent were able to intain infiltration rates in excess of 0.5 inches hour throughout the summer. The original ver of alfalfa and brome grass maintained infil-tion rates in excess of one inch per hour and p growth thrived. Infiltration rates would not pear to be a deterrent factor in the design of ctical, economical, infiltration-percolation ins. An effluent standard with concentrations 10 mg/l of BOD5 and suspended solids would bably be met with a full-scale infiltration- per-ation basin during the summer if it were con-ucted to preclude short-circuiting of wastewater the ground water drains. With weekly applica-ns of wastewater the oxidation of ammonia rogen to nitrates was indicated. Ammonia rogen reductions were accomplished and the ef-ent from the infiltration-percolation basins uld have met a 1.5 mg/l ammonia nitrogen stan-d about 50 percent of the time. Nitrate nitrogen ncentration excess of 10 mg/l might be expected reach the ground water from infiltration-per-ation basins operated on a weekly cycle of stewater application if an adequate underdrain tem were not installed. About 50 percent of the sphorus applied with the wastewater was noved but effluent concentrations frequently ceeded 1.0 mg/l. Leaching of soluble salts from soil is indicated by the higher conductivity of effluent from the pilot basins.

NITRIFICATION WITH A BACTERIAL DISC IT,
tional Inst. for Water Research, Pretoria (South ica).
R. Davies, and W. A. Pretorius.
ter Research, Vol. 9, No. 3, p 459-463, March 5. 5 fig, 12 ref.

scriptors: *Denitrification, *Bacteria, Anaero-conditions, Anaerobic bacteria, Chemical reac-ns, *Waste water treatment, *Biological treat-nt.

An enclosed rotating disc unit was operated anaerobically as a denitrifying system, with methanol as the hydrogen donor. The C:N ratio necessary for complete denitrification was 2.6:1. Optimum pH for denitrification lay in the range between 7.0 and 8.5. Q sub 10 values were 1.38 between 10 and 30 C, -2.66 above 30 C and 13.06 below 10 C. (Skogerboe-Colo St)
W77-00550

OZONATION OF AMMONIA IN WASTE-WATER,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
P. C. Singer, and W. B. Zilli.
Water Research, Vol. 9, No. 2, p 127-134, February 1975. 9 fig, 1 tab, 10 ref.

Descriptors: *Waste water, *Ozone, *Ammonia, *Waste water treatment, Phosphates, Municipal wastes, Tertiary treatment.
Identifiers: *Ozonation.

An investigation of the effects of ozone on ammonia in municipal wastewaters is described and discussed relative to the application of ozone for advanced waste treatment. Ammonia is oxidized completely to nitrate, thereby eliminating the nitrogeneous oxygen demand of the waste. In buffered solutions of ammonium chloride, the reaction is first-order with respect to the concentration of ammonia and the rate increases with increasing pH over the range 7-9, and with increasing ozone partial pressure. (Skogerboe-Colo St)
W77-00553

DEFUSING THE SEWAGE STINKBOMB ON THE TYNE.
Surveyor Public Authority Technology, Vol. 147, No. 4365, p 14-15, February, 1976. 1 fig.

Descriptors: *Sewage treatment, *Sewers, *Sewerage, *Storm water, Hydraulic structures, Construction, Pipelines, Rivers, Surface waters, Projects, Costs, *Combined sewers, Waste water treatment, Sewage disposal.
Identifiers: *Tyne River, Great Britain.

The Northumbrian Water Authority's Tyneside Sewerage Scheme is described. The aim of the scheme is to remove the sewage nuisance currently plaguing the Tyne by treating the sewage and then taking it out to sea. Total cost of the project is estimated at 65 million pounds, and project completion is scheduled for 1980. Once the main interceptor sewers are complete, efforts will begin to take pumped sewage from the low-lying areas between the interceptors and the river banks into the interceptor system. The foul sewer system has been designed for the year 2054; thus, everything is oversized for present flows. In the early stages of the scheme, some storm sewage will be accepted through a storm overflow system. The balance of the stormwater will go into the river. As the system reaches design capacity, it will revert gradually to two separate systems. (Kreager-FIRL)

AGGREGATION TREATMENT APPARATUS FOR WASTE WATER,
Denki Kagaku Kogyo Kabushiki Kaisha, Tokyo (Japan). (Assignee).
S. Motozawa, H. Itoga, H. Wada, and H. Marukawa.
United States Patent 3,970,562. Issued July 20, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 3, p 1103, July, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Flocculation, *Separation techniques, *Suspended solids, Equipment, Design criteria, Electrodes, Aggregates, Colloids, Metals.

A patent for an apparatus capable of aggregating suspended colloidal solids in waste water is described. The device consists of the following sections: a suspending stage in which metallic particles of metal oxide, or sintered metal oxide carrying an electrical charge opposite to that on the solids in the waste water are suspended in a feed flow of the waste water; an electrical aggregating stage in which the feed flow with suspended particles is passed between oppositely charged electrodes to flocculate oppositely charged particles and colloidal solids; and a separating stage in which the metallic particles are separated from the flocculant-containing water. The suspending and separating stages are formed as an integral unit having an inverted conical upper section and a means for introducing the flocculant-containing flow from the aggregating stage in a tangential direction adjacent to the upper end. A means for removing the collected flocculated matter and effluent water from an interior point of the conical section is also provided. (Kreager-FIRL)
W77-00560

SEWAGE SYSTEM,
B. E. Brennan.
United States Patent 3,972,650. Issued August 3, 1976. Official Gazette of the United States Patent Office, Vol. 949, No. 1, p 203-204, August 1976. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Hydraulic equipment, *Design criteria, Valves, Sewage, Equipment, Waste water treatment.

A patent for a preassembled sewage collection unit designed for connection between a sewage source and a sewage discharge system is described. The sewage collection unit includes: a container having sewage inlet and outlet openings, each associated with a check valve; an air inlet connection and an air vent; a multi-stage valve assembly mounted within the upper portion of the container and connected to the air inlet and air vent; a cam which can be shifted between two limit positions and can be engaged by a pilot valve actuator; a float which can be shifted in response to the level of sewage in the container; and a quick-throw mechanism in the container which is responsive to variations in the level of the float for shifting the cam from one limit position to the other. The multi-stage valve assembly includes a pilot valve connected to the air inlet, a first pneumatically actuated valve connected to the air inlet and responsive to actuation of the pilot valve, and a second pneumatically actuated valve responsive to actuation of the first pneumatically actuated valve for discharging compressed air into the upper portion of the container. ELECTROCOAGULATION SYSTEM FOR REMOVING POLLUTANTS FROM WASTE-WATER,
Swift and Co., Chicago, Ill. (Assignee).
E. R. Ramiriz.
United States Patent 3,969,245. Issued July 13, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 2, p 657, July 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Separation techniques, *Coagulation, *Electrolysis, Bubbles, Flocculation, Waste treatment.
Identifiers: *Electrocoagulation.

A patent for an electrocoagulation method capable of removing pollutants from raw waste water is described. The method consists of the following steps: providing a bubble supply produced electrolytically by decomposing a flow of waste water; positioning the bubble supply as a cylindrically shaped dense zone of fine bubbles in a direction longitudinal to the flow of waste water; rapidly flowing the waste water through the dense zone of fine bubbles; turbulently contacting the fine bub-

bles with pollutants in the waste water to form a buoyant embryo floc within the waste water; venting the dense bubble zone to the atmosphere to prevent pressure buildup within the zone; removing the unseparated flow of waste water and embryo floc from the dense bubble zone such that some of the buoyant embryo floc is combined into a buoyant full floc; introducing the full floc and waste water into a downstream flotation basin such that the buoyant full floc rises to near the surface of the waste water in a manner approximating a laminar flow; and then clarifying the waste water by separating the full floc from the waste water. TANK CLARIFICATION PLANT,
Rice (F. B.) and Co., Balmain (Australia).
J. R. Kaelin.
Australian Patent 472,050. Issued May 13, 1976. Australian Official Journal of Patents, Trade Marks, and Designs, Vol. 46, No. 16, p 1546-1547, May 13, 1976.

Descriptors: *Patents, Flow, *Sewage treatment, *Waste water treatment, Equipment, *Design criteria, Water levels, Oxygenation, Separation techniques, Treatment facilities, Tanks.

A patent for a tank clarification plant designed for handling large-scale irregular sewage influx is described. The device consists of the following components: a tank; a liquid circulation member disposed adjacent the lower region of the tank and in the central area thereof; several impeller blades associated with the circulation member for causing liquid in the tank to circulate in a direction from above the impeller blades to the upper level of the liquid in the tank; at least one stationary cutting blade disposed immediately adjacent the liquid circulation member and having leading edges continuously cooperable with the impeller blades of the circulation member for producing a shearing effect therebetween; a conduit in the tank which is open at one end to the exterior of the tank and at the other end immediately above the liquid circulation member for the purpose of introducing oxygen or an oxygen-containing gas mixture into the immediate vicinity of the inlet side of the liquid circulation member; and a means for controlling the liquid level in the tank to insure that the liquid level is always above the liquid circulation member. (Kreager-FIRL)

SLUDGE ELEVATOR FOR FLUID CLARIFICATION SYSTEM,
Cincinnati Butchers Supply Co., Ohio. (Assignee).
F. A. Zaenkert.
United States Patent 3,966,617. Issued June 29, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 5, p 2252, June 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Separation techniques, Equipment, *Design criteria, Liquid wastes, Waste treatment, Sludge.

A patent for a fluid clarification device designed to separate scum, sludge, and clear fluid from contaminated effluent is described. The device consists of the following components: a separator tank with a rotable shaft which extends axially for the entire height of the tank; an inlet pipe extending upwardly into the tank from the bottom thereof and having an effluent discharge opening for discharging contaminated effluent within the tank; a cylindrical housing disposed coaxially around the inlet; a circular splash plate located above the discharge opening and connected to the rotatable shaft; a circumferential channel defined by an outer side wall and an inner wall, with the bottom edge of the inner wall spaced upwardly from the bottom a distance greater than the maximum depth of sludge accumulation on the tank bottom so as to define a fluid discharge port for clean effluent; a skimmer means for sweeping floatable particles from the fluid surface; and a scraper blade for removing settled particles from the tank bottom. The circumferential edge of the splash plate defines several radially and downwardly directed ports for directing the flow of contaminated effluent impinging against the plate from the inlet discharge opening in an outward and downward direction into the tank at a level below the liquid surface. (Kreager-FIRL)
W77-00564

DOUBLE FUNNEL DEVICE FOR OXYGENATING SEWAGE,
Atara Corp., Montreal (Quebec). (Assignee).
J. W. Romanowski.
United States Patent 3,968,086. Issued July 6, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 1, p 261, July 1976. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Oxygenation, Equipment, *Design criteria, *Waste water treatment, Liquid wastes.

A patent for a device designed to oxygenate liquid sewage is described. The device consists of the following components: a means for supplying a pressurized oxygen-containing gas which includes an orifice for issuing a continuous stream of gas upwardly from below the top surface of the liquid sewage; a means for securing a first funnel at a location downstream from the orifice, with the upstream opening of the first funnel comprising a first inlet for entraining liquid sewage; a second funnel extending downstream from the downstream opening of the first funnel; a means to secure the second funnel in a predetermined relationship to the first funnel, with the upstream opening of the second funnel comprising a second inlet for intraining liquid sewage; an exit tube extending both upstream and downstream from the downstream opening of the second funnel, with an upstream opening in the exit tube which comprises a third inlet for liquid sewage entrainment; and a means for securing the exit tube to the gas supplying means. (Kreager-FIRL)
W77-00565

METHOD OF TREATING WASTE WATER,
Exxon Research and Engineering Co., Linden, N. J. (Assignee).
A. W. Liles, and R. D. Schwartz.
United States Patent 3,968,036. Issued July 6, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 1, p 248-249, July, 1976. 1 fig.

Descriptors: *Patents, *Biological treatment, *Waste water treatment, *Activated sludge, *Catalysis, Industrial wastes, Municipal wastes, Byproducts, Carbon, Organic compounds, Oxidation, Nucleation, Oxides, Metals.

A patent for a process which biologically treats industrial and municipal waste water containing organic carbon is described which utilizes a catalyst which has been deactivated in a fluid cracking process. The method involves mixing the waste water with an activated sludge at conditions which promote the biological oxidation of a portion of the organic carbon present in the waste water. These conditions include operation at a temperature between 10 and 60C and the separation of the effluent from the mixture of waste water and activated sludge. The novel aspect of the process involves the mixing of a catalyst with the activated sludge. The catalyst is one which has been deactivated in a fluid cracking process and comprises vanadium, iron, nickel, copper, and carbon supported on an inorganic oxide of alumina, silica, aluminum silicates, or mixtures thereof. The ration of the inorganic oxide, which acts as a nucleation center in the process, to activated sludge is anywhere from 0.1 to 10 weight %. (Kreager-FIRL)
W77-00566

PROCESS AND APPARATUS FOR TREATING WASTES BY A COMBINED ACTIVATED SLUDGE AND BIOLOGICAL FILTER BED,
J. Tymoszczuk.
United States Patent 3,968,034. Issued July 6, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 1, p 248, July, 1976. 1 fig.

Descriptors: *Patents, *Biological treatment, *Activated sludge, *Filtration, *Waste water treatment, Aeration, Sewage treatment, Recycling, Design criteria, Equipment.
Identifiers: *Biological filter beds.

A patent for a biological process and apparatus designed to treat waste water and sewage is described. The process involves the following steps: maintaining a submerged aerated biological filter bed zone in which finely divided particulate filtering media circulate; maintaining an aerated activated sludge zone in an upstream fluid zone; feeding waste to the activated sludge zone; recycling the waste from the activated zone through the biological filter bed and back to the activated sludge zone; maintaining a biological stable filter bed zone in downstream fluid flow relationship to the aerated biological filter bed zone and activated sludge zone so that the waste passes thereto; draining the treated waste from the biological stable filter bed zone; and backwashing the biological stable filer bed zone as often as required to maintain the operating effectiveness of the filter and an acceptable headloss at the treated effluent withdrawal point. (Kreager-FIRL)
W77-00567

EMULSION POLYMERIZATION OF CATIONIC MONOMERS,
Calgon Corp., Pittsburgh, Pa. (Assignee).
J. E. Morgan, and J. E. Boothe.
United States Patent 3,968,037. Issued July 6, 1976. Official Gazette of the United States Patent Office, Vol. 948, No. 1, p 249, July, 1976.

Descriptors: *Patents, *Sludge treatment, *Dewatering, *Filtration, *Polymers, *Emulsions, Surfactants, Waste water treatment, Chemical reactions, Solubility.

A patent for a process that releases water from activated sewage sludge is described. The process involves the following steps: addition to the sludge of between 0.1 and 20 ppm of a cationic polymer which is prepared by forming an aqueous solution of between 5-95% by weight of dimethl diallyl ammonium chloride and between 0.005 and 5 mole based on the moles of dimethyl diallyl ammonium chloride of a copolymerizable polyunsaturated cross-linking monomer selected from methylenebisacrylmide, methyl triallyl ammonium chloride, or tetraallyl ammonium chloride preparation of a water-in-oil emulsion of the aqueous solution in a water insoluble liquid containing a surfactant, with the water insoluble liquid being between 25 and 90% by weight of the total emulsion and the surfactant being 0.5% to 10% by weight of the total emulsion; heating the emulsion to a temperature sufficient to polymerize the monomers in the presence of a free radical polymerization initiator, with the free radical initiator being present in amounts varying from 0.0000001 to 0.1 mole/mole of dimethyl diallyl ammonium chloride; and filtering the sludge-polymer mixtre. (Kreager-FIRL)

TING POLLUTED WATER.
alian Patent 471,335. Issued April 1976. Offi- urnal of Patents, Trade Marks and Designs, , No 13, p 1238, April, 1976.

iptors: *Patents, *Waste water treatment, ration techniques, *Coagulation, rption, Filtration, Bactericides, Suspended , Biochemical oxygen demand, Phosphorus, treatment.

nt for a process to treat polluted water such disposable mass of solids is produced along n effluent with a relatively low biochemical n demand, low suspended solids level, and osphorus content is described. The method es establishing a mixture of the polluted with four additives: a bactericidal agent, a al solids coagulating agent, a filter aid, and orbent. The aqueous medium has a solids e size resulting from recirculation between a polluted water accumulation zone and a zone adapted to effect coarse disintegration of any solids exceeding a predetermined particle size. The mixture of polluted water and additives is passed through a liquid and airtight liquid flow system under conditions to effect an intimate mixing of the additives and to maintain the solids in suspension. The liquid portion of the suspension is then separated from the solids for discharge as a substantially solids-free effluent. (Kreager-FIRL)

TREATMENT OF SEWAGE.
Australian Patent 472,563. Issued May 27, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 18, p 1749, May, 1976.

Descriptors: *Patents, *Sewage treatment, *Separation techniques, *Disinfection, *Color, Chemical reactions, Recycling, Waste water treatment, Physical properties, Chemical properties.
Identifiers: Deodorization, Decolorization.

A patent for a method of treating sewage is described. The method involves the following steps: flushing the sewage with a flushing liquid from serveral receivers to form a mixture of liquid and sewage; separating the mixture into a portion containing a high level of solids and another portion containing a high level of liquid; separating the solid matter from the liquid with a high liquid content; maintaining a chemical composition in the liquid such that it acts as a disinfectant and deodorant; maintaining a bleaching action in the liquid to achieve a decolorizing effect; using the liquid as flushing liquid for the step; subjecting the high solids portion of the waste to mechanical particle size reduction; and holding the high solids portion of the waste in storage so that substantially all of the solid matter is exposed to the chemical content of the liquid and is thereby broken down, dispersed, sterilized, and deodorized. DECANTING WASTE WATER.
Australian Patent 472,574. Issued May 1976. Official Journal of Patents, Trade Marks and Designs, Vol 46, No 18, p 1752, May, 1976.

Descriptors: *Patents, *Waste water treatment, Flow characteristics, *Separation techniques, Sludge treatment, Currents(Water), Waste treatment, Liquid wastes, Biological treatment.

A patent for a method of treating waste water and any flocculating agents which may be required is described which involves passing the liquid upwardly over a sludge bed. The liquid is introduced periodically through and across the surface of the base of the sludge bed, with the treatment time being very short relative to the pauses which follow them. The liquid is removed from the above sludge bed after treatment. The method offers improved settling characteristics over prior art methods by directing the liquid through a preferential current imparting means in a direction of flow inclined to the horizontal. The preferential current imparting means extends upwardly in the sludge bed from its base surface, thereby resulting in enhanced sludge settling in the bed and the generation of preferential currents in the liquid and sludge. METHOD OF WASTEWATER TREATMENT,
Autotrol Corp., Milwaukee, Wis. (Assignee).
W. N. Torpey.
United States Patent 3,976,568. Issued August 24, 1976. Official Gazette of the United States Patent Office, Vol. 949. No. 4, p 1555, August, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Hydrogen sulfide, *Biological treatment, *Separation techniques, Organic compounds, Digestion, Waste treatment.

A patent for a method of treating waste water containing settleable organic solids and solublilized carbonaceous pollutants is described. Th method consists of the following steps: supplying the waste water to a treatment tank having upper and lower zones, settling the organic solids from the waste water in the upper zone, accumulating the settled solids in the lower zone, anerobically digesting the settled organic solids in the lower zone, and maintaining the waste water in the upper zone for a predetermined detention to produce a waste water effluent that is virtually free of dissolved or entrained hydrogen sulfide. W77-00574

PHOSPHORUS REMOVAL FROM WASTE WATER.
Australian Patent 473,137. Issued June 17, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 21, p 2029-2030, June, 1976.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, *Aeration, *Phosphorus compounds, Sludge, Chemical precipitation, Recycling, Oxygenation.
Identifiers: *Phosporus removal.

A patent for a method designed to treat waste water containing biodegradable carbonaceous pollutants and phosphorus compounds is described. The method involves the following steps: introducing the waste water into a first aeration zone where it is mixed with a carbon-food consuming sludge and a phosporus-precipitating compound while being broutht into intimate contact with an oxygenating feed gas; recycling the sludge settled from the effluent liquor to the first aeration zone; passing the solids-sepleted liqid effluent into a second aeration zone where it is mixed with a carbonfood consuming sludge while being brought into intimate contact with a second oxygenating gas; and discharging the solids-depleted liqid effluent from the second aeration zone as product effluent water. The carbon-food consuming sludge in the second aeration zone consists at least in part of recycled sludge settled from the effluent liquor of the second aeration zone. (Kreager-FIRL)

APPARATUS FOR TREATMENT OF AQUEOUS SEWAGE COMPOSITION,
Heds, Inc., Chagrin Falls, Ohio. (Assignee).
T. C. Johnson, and J. D. Snodgrass.
United States Patent 3,975,256. Issued August 17, 1976. Official Gazette of the United States Patent Office, Vol. 949, No. 3, p 1105, August 1976. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Separation techniques, *Electrodes, Design criteria, Electrical equipment, *Waste water treatment, Electric currents, Equipment.

A patent for an apparatus capable of treating aqueous sewage without mechanical manipulation is described. The device consists of the following components: an enclosed chamber for receiving the aqueous sewage composition in its lower portion, thus defining an ullage space in its upper portion; a gas-tight valved inlet for the aqueous sewage which opens into the top of the ullage space; at least two electrodes of unlike polarity extending into a treatment space at the lower sewage-receiving portion of the chamber below the ullage space; a means for imposing on the electrodes a potential difference which is sufficient to effect an electrolytic discharge of gas at at least one of the electrodes as well as a current across the electrodes which is sufficient to cause an ebul-

lient rolling action which in turn causes the generation of a solids-containing head of lesser density above the aqueous sewage composition; and an outlet from the top of the ullage space which is connected through a conduit to a discharge end and allows for the outward passage of the solids-containing head. (Kreager-FIRL)
W77-00577

TREATING SEWAGE AND RECOVERING USABLE WATER AND SOLIDS,
B. J. Stralser.
United States Patent 3,975,247. Issued August 17, 1976. Official Gazette of the United States Patent Office, Vol. 949, No. 3, p 1102-1103, August 1976. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Separation techniques, Electrical equipment, *Reclamation, Electrodes, Design criteria, Chlorides, *Waste water treatment, Electric currents, Bacteria, Suspended solids.

A patent for a process and apparatus that treats sewage and recovers usable water and solids which are substantially free of live bacteria is described. The method involves the following steps: diluting the sewage with water to greater than 20 parts of water to one part solids (by weight); macerating the diluted material; passing the diluted macerated sewage upwardly through a screen thereby separating the non-suspended solids from the liquid; adjusting the chloride salt content of the sewage to between a minimum of 0.05% and a maximum of 3.5% (by weight); passing the screened sewage in a serpentine path progressively between a series of parallel electrodes; removing the evolved gases as the sewage progressively passes between the electrodes; and separating the liquid and suspended solids after the sewage passes between the electrodes. The electrical current flow between adjacent electrodes and through the sewage is between 0.25 and 1.0 amperes/sq in of electrode surface. (Kreager-FIRL)
W77-00578

HIGHLY ENERGY EFFICIENT-WILTON WASTEWATER TREATMENT PLANT,
D. A. Wilke, and D. R. Fuller.
Civil Engineering-ASCE, Vol. 46, No. 5, p 70-72, May 1976. 3 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Energy conversion, Economics, Gravity, Solar radiation, Construction, Materials, Concrete construction, Dewatering, Biological treatment, Disinfection, Stabilization, Design.

A highly efficient waste water treatment plant design that minimizes the need for offsite energy requirements is described. The design takes advantage of gravity flow to reduce pumping needs, solar energy to provide heat for the anaerobic digesters, and concrete construction to retain heat for the building itself. Waste water is lifted into the plant by screw pumps which use less energy than conventional pumps and flows through the rest of the plant by gravity. Pretreatment is provided by comminution and grit removal. Gross solids are removed by rotary screens. Secondary biological treatment is accomplished via a rotating biological contactor. Final solids separation is accomplished in clarifiers from which the solids are combined with the primary screenings and pumped to anaerobic digesters for stabilization before dewatering and disposal. Disinfectant for the effluent is generated on-site electrochemically from salt and water. First year energy cost savings are estimated to be $4700. (Kreager-FIRL)

INTERACTIONS BETWEEN SLUDGE CONDITIONING, VACUUM FILTRATION, AND INCINERATION,
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
G. L. Christensen, W. R. Elliott, and W. K. Johnson.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 1955-1969, August 1976. 15 fig, 3 tab, 26 ref.

Descriptors: *Sludge treatment, *Chemical reactions, *Dewatering, *Filtration, *Incineration, Waste treatment, Analytical techniques, Lime, Iron compounds, Chlorides.
Identifiers: Ferric chloride, *Vacuum filtration.

Laboratory investigations of chemical sludge conditioning, vacuum filtration, and filter cake incineration were conducted. Neither lime nor ferric chloride alone was capable of producing a conditioned sludge suitable for vacuum filtration, even at doses as high as 30% on a dry solids basis. The most effective combination for chemical conditioning was 5% ferric chloride and 15% lime. Specific resistance measurements of sludge dewaterability exhibited considerable scatter, while capillary suction time measurements were quite precise. Nevertheless, specific resistance measurements reflected the improved sludge solids leaf yields associated with increases in ferric chloride and lime doses, whereas capillary suction time measurements did not. The water to sludge solids ratio was the utmost importance in assessing auxiliary fuel requirements for filter cake incineration. (Kreager-FIRL)

EVALUATION OF A SULFUR-THIOBACILLUS DENITRIFICANS NITRATE REMOVAL SYSTEM,
Agricultural Research Service, Beltsville, Md.
L. J. Sikora, and D. R. Keeney.
Journal of Environmental Quality, Vol. 5, No. 3, p 298-303, July-September, 1976. 6 fig, 3 tab, 32 ref.

Descriptors: *Denitrification, *Septic tanks, *Sewage treatment, *Domestic wastes, *Nitrates, *Biological treatment, Bacteria, Sulfates, Groundwater, Sulfur, Carbon, Inorganic compounds, Organic compounds, *Waste water treatment, Kinetics, Chemical reactions.
Identifiers: *Thiobacillus denitrificans.

A sulfur-Thiobacillus denitrificans nitrate removal system was evaluated as a means of denitrifying nitrified septic tank effluent. Duplicate 10 by 64 cm columns were filled with a 1/1 mixture (by weight) of elemental sulfur and dolomite chips and were pretreated by recycling an enrichment culture of Thiobacillus denitrificans ATCC 23642 through the columns for 3 days. Continuous passage of the nitrified septic tank effluent containing 40 micrograms of nitrate/milliliter through the columns resulted in nearly complete nitrate removal in 3.3 hours at steady state conditions. The denitrification kinetics appeared to be first order in the range of nitrate concentrations used. Sulfate was the major sulfur end product and was present at relatively high concentrations (90 micrograms/milliliter). Passage of column effluent through 10 by 60 cm Plainfield sand columns did not significantly decrease sulfate levels. A significant decrease in inorganic carbon content occurred with depth in the columns, but changes in organic carbon were insignificant. Although the use of this nitrate removal system appears promising, sulfate contamination of the groundwater may limit its applicability. (Kreager-FIRL)

EFFECTS OF LIME ADDITION ON TRE MENT PLANT OPERATION,
URS Co., Seattle, Wash. Studies and Planning.
G. R. Minton, and D. A. Carlson.
Journal Water Pollution Control Federation, 48, No. 7, p 1697-1727, July, 1976. 12 fig, 13 tab ref.

Descriptors: *Lime, *Waste water treatm *Additives, *Influent streams, *Effluent strea Biological treatment, Chemical properties, Ph cal properties, Suspended solids, Oxygen dem Sludge, Solid wastes, *Treatment facili Operations.
Identifiers: Clarifiers.

The effect of using lime as a clarifying chemica the total operation of a waste water treatm facility is discussed. Lime addition to the waste water can be expected to result in a decr in suspended solids and oxygen demand in the mary effluent. A relatively clear effluent ca produced at insolubilization pH's of 9.5, 10, 1 and 11-11.5 in waste waters of high, moderate, low hardness and alkalinity, respectively coagulant aid will be required for low hardn low alkalinity waste waters and probably also waste water with moderate hardness and alka ty. The settling rate of the floc will incre benefiting hydraulically overloaded clarif Modification of the primary effluent will als fect the biological process. Lower organic load will occur, benefiting an organically overlo process; however, it is possible that too low a ganic loading will result in a deterioration of final effluent. Both the quantity and qualit solids and sludge will be significantly altere lime addition. If the system is operated within pH ranges identified above, solids will increas a factor of two to three. The quantity of sl may not increase correspondingly because o increase in the solids concentration. (Krea FIRL)

THE PERFORMANCE-POTENTIAL POLYELECTROLYTES AND HIGH VELOC GRADIENTS IN THE TREATMENT WASTEWATERS,
Ife Univ.(Nigeria). Dept. of Agricultural Engi ing.

Ogedengbe.
ffluent and Water Treatment Journal, Vol. 16, o. 6, p 289-292, June, 1976. 2 fig, 2 tab, 5 ref.

escriptors: *Sewage treatment, olyelectrolytes, *Coagulation, Sedimentation, edimentation rates, Biochemical oxygen demand, Suspended solids, Turbidity, *Waste water eatment, Treatment facilities, Feasibility studes, *Performance.
entifiers: Primary sedimentation.

e performance of polyelectrolytes in the coagution of sewage under varying conditions of locity gradients was investigated to assess the asibility of using such materials to obtain higher movals of suspended solids and biochemical oxen demand in primary sedimentation tanks. gh velocity gradients were found desirable up to out 500/sec when a domestic waste water was eated with cationic polyelectrolytes. An exnded period of rapid mixing was also found sirable up to about 25 minutes. Turbidity moval was improved when bentonite clay or alunum sulfate was used as a coagulant aid along th the polyelectrolyte. The results indicated that e management of existing domestic waste water eatment plants can be improved by the use of gh velocity gradients, an extended period of ear, and the addition of polyelectrolytes with me form of coagulant aid to the primary treatnt units. The total length of time required (30 nutes of rapid and slow mixing plus 20 minutes quiescent settling) is considerably less than the nventional detention time of about 2 hours comnly used in primary sedimentation. OR NITRIFICATION - ONE SLUDGE OR VO,
own (P. E.) and Devlin Associates, Seneca, N.

G. Brown.
nerican City and County, Vol. 91, No. 7, p 49-, July, 1976. 1 tab.

escriptors: *Nitrification, *Activated sludge, ilot plants, *Efficiencies, *Nitrogen fixation, trogen fixing bacteria, *Waste water treatment, rformance, Evaluation, Temperature, Design teria, Treatment facilities.

pilot plant study comparing parallel systems of rbon oxidation and nitrification versus comed nitrification revealed no apparent difences in the efficiency and performance of one- d two-sludge nitrifying systems operated under same growth conditions at the same temperae. The pilot study was conducted at two temratures: 8 C and 20 C. The maximum growth es of nitrifying bacteria at these two temperaes were determined to be 0.25 days and 0.5 ys, respectively. Essentially complete nitrifican was attained at both temperatures at biologi- solids retention times of 20 days and 10 days, pectively. The results of the study indicated t nitrification in the activated sludge process be effectively controlled by application of the ncept of biological solids retention time and appriately determined sludge wasting policies. e results also indicated that the nitrification ocess should be selected on the basis of onomic and operating criteria rather than on ocess performance. TOMATION IN SEWAGE PROCESSING,
mens A.G., Karlsruhe(West Germany). Measement and Process Engineering Div.
Michel.
mens Review, Vol. 43, No. 5, p 184-190, May, 6. 9 fig, 9 ref.

escriptors: *Treatment facilities, *Automation, onitoring, *Automatic control, *Sewage treatment, Chemical oxygen demand, Computers, Analytical techniques, Photometry, Design criteria, Equipment.

Automated instrumentation for the monitoring and control of sewage plant operations is discussed, with particular reference to a chemical oxygen demand measuring system and closed-loop control. The chemical oxygen demand measuring system requires an analysis time of about 25 minutes and can operate for 8-10 days without maintenance. Analysis takes place in a double-beam photometer with a reference beam of 750 nanometers and a measuring beam of 440 nanometers. The measuring ranges are: 0-100, 0-500, and 0-1000 milligrams of chemical oxygen demand/liter. A closed-loop control system is illustrated in which the oxygen supply is controlled by a reference variable expressing the amount of oxygen required for decomposition of the organic matter in aeration tanks. A photoelectric program transmitter can be connected to provide a reference variable expressing the daily oxygen load curves as empirical values. Advantages offered by the use of process computers in the control of sewage plant operations are also discussed. (Kreager-FIRL)
W77-00586

UTILIZATION OF ALUMIZED RED MUD SOLIDS FOR PHOSPHORUS REMOVAL,
Black, Crow and Eidsness, Inc., Gainesville, Fla. Process Design Dept.
E. E. Shannon, and K. I. Verghese.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 1948-1954, August, 1976. 3 fig, 4 tab, 6 ref.

Descriptors: *Water treatment, *Phosphorus, *Coagulation, *Pilot plants, *Feasibility studies, Costs, Biochemical oxygen demand, Suspended solids, Evaluation, Performance, Byproducts, Chemical precipitation, *Waste water treatment.
Identifiers: Alumized red mud.

The feasibility of using alumized red mud solids to precipitate phosphorus from water was investigated. Alumized red mud solids are the product obtained when red mud (a waste material formed during the production of alumina) is slurried with sulfuric acid followed by heat drying and crushing of the resulting solid product. Preliminary pilot plant studies revealed that the use of alumized red mud solids as a coagulant in fullscale phosphorus removal facilities is technically feasible. Practical dosage levels required to achieve a 1-milligram/liter total phosphorus level were around 200 milligrams/liter. Full-scale demonstration studies are planned to confirm the pilot plant results. Chemical cost savings on the order of 35% over traditional phosphorus removal systems are anticipated. Raw waste water biochemical oxygen demand and suspended solids removals obtained by the use of the alumized red mud solids at a dose of 200 milligrams/liter were comparable with removals obtained by alum at 200 milligram/liter and superior to those obtained by lime at 250 milligrams/liter. W77-00587

SODIUM ALUMINATE IMPROVES SLUDGE PROPERTIES,
Greene County Wastewater Treatment Plant, Ohio.
C. F. Lenhart.
American City and County, Vol. 91, No. 8, p 36-37, August, 1976.

Descriptors: *Waste water treatment, *Activated sludge, *Additives, *Physical properties, *Chemical properties, On-site investigations, Sludge digestion, Phosphorus, Biochemical oxygen demand, Suspended solids.
Identifiers: Sodium aluminate, Alum.

The use of sodium aluminate to improve sludge properties was evaluated during a 43-week study at an activated sludge waste water treatment plant. During the study, liquid sodium aluminate was added at a rate sufficient to produce a concentration of 10 milligrams/liter (as aluminum) in the sewage as it entered the aeration tanks. Three 4-week addition periods were separated by equal periods with no alum addition. The median sludge volume index during the aluminate treatment was 86 as compared with 146 during the non-treatment periods. Aluminate addition also resulted in increased floc density which kept the secondary clarifier sludge blanket in place, preventing washouts even during periods of severe hydraulic overload. The denser floc also proved helpful in sludge digestion. It became easy to form a separable supernatant that was low in biochemical oxygen demand and suspended solids and that could easily be withdrawn from the aerobic digestion tanks. Phosphorus removal during the treatment periods averaged 80% as compared with a normal 42% removal without aluminate. Residual benefits in the process continued for 10 days after aluminate feed was discontinued. Improvement was observed within 24 hours following the initiation of aluminate addition. (Kreager-FIRL)

SINGLE-STAGE NITRIFICATION-DENITRIFICATION,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
D. F. Bishop, J. A. Heidman, and J. B. Stamberg.
Journal Water Pollution Control Federation, Vol. 48, No. 3, p 520-532, March, 1976. 5 fig, 8 tab, 15 ref.

Descriptors: *Nitrification, *Denitrification, *Activated sludge, *Waste water treatment, *Pilot plants, Biological treatment, Nitrogen, Dissolved oxygen, Design criteria, Efficiencies, Treatment facilities, Performance, Evaluation.
Identifiers: Bulking.

The removal of 75-84% of nitrogen from primary waste water has been achieved recently in a single-stage activated sludge (30,000-50,000 gallons/day) pilot plant without the use of supplemental organic carbon. The removal was achieved in a two-pass biological reactor in which the dissolved oxygen concentration was varied from 0 to 3 milligrams/liter. Air from a blower was applied on a 30-minute cycle, first to one reactor pass and then to the other. Mechanical mixers suspended the mixed liquor solids when the air was not applied to the pass. Nitrification occurred readily when the dissolved oxygen concentration was equal to or greater than 2 milligrams/liter; when the dissolved oxygen level was decreased to near zero, denitrification occurred. The chemical oxygen demand to total Kjeldahl nitrogen ratio in the waste water entering the reactor controlled the amount of nitrogen removal. A nitrogen removal of 84% was achieved in the summer at a ratio of 10:1; and during the winter, 75% of the total nitrogen based on the primary effluent was removed. Bulking problems limited winter operations and required low overflow rates (300 gallons/day/sq ft) to capture the solids in the clarifier. (Kreager-FIRL)

B. Wolverton, and R. C. McDonald.
New Scientist, Vol 71, No 1013, p 318-320, August 12, 1976. 1 fig, 3 tab.

Descriptors: *Water hyacinth, *Waste water treatment, *Nutrients, *Heavy metals, *Organic compounds, Sewage treatment, *Biological treatment, Treatment facilities, Domestic wastes, Chemical wastes, Fertilizers, Byproducts, Methane, Mississippi, Lagoons.

Experiments conducted by the National Aeronautics and Space Administration indicate that water hyacinths (Eichhornia crasspipes) have the ability to absorb organics, heavy metals, nutrients, and other chemical elements from waste water under tropical and subtropical conditions while producing a large quantity of plant material. This water hyacinth biomass, when grown in sewage free of toxic metals, is a potential source of protein fertilizer, methane gas, and other valuable products. Currently, a water hyacinth chemical waste filtration system consisting of a zig-zag canal 330 meters long, 6.4 meters wide, and 0.8 meters deep is treating 95,000 liters/day of chemical and photo lab waste. On the basis of an analysis of raw sewage from small communities in South Mississippi, a half hectare lagoon covered with water hyacinths with a minimum sewage retention time of 2 weeks is estimated to be capable of purifying the daily wastes of 1000 people. An experimental water hyacinth lagoon has already reduced pollutant levels by 75-80%. (Kreager-FIRL)

ADVANCED TREATMENT AND PLANNED DEVELOPMENT CONTROL COUNTY'S POLLUTION,
K. Hotz.
Water and Sewage Works, Vol 123, No 8, p 74-76, August, 1976. 3 fig.

Descriptors: *Sewage treatment, *Sewerage, *Treatment facilities, *Biological treatment, Physical control, Adsorption, Activated carbon, Oxidation, Activated sludge, Regional development, Projects, *Tertiary treatment, Planning, Ohio.
Identifiers: Biophysical treatment, Medina County(Ohio).

Plans for a regional sewage collection and treatment system which include a biophysical waste water treatment facility using powdered activated carbon and wet air regeneration are described. The facility will be one of the first permanent applications of such a system in the United States. A development plan is also to be established so that population growth will be promoted where facilities already exist, thus avoiding random growth and making waste water treatment the determining factor in future residential and industrial development. The treatment facility will combine the physical adsorption and biological oxidation phases into a single treatment step, and the system will be incorporated within an existing single stage activated sludge system. The biophysical approach will make it possible for the treatment system to withstand shock loads which often limit the effectiveness of ordinary biological treatment methods. The need for costly disposal of excess activated sludge is eliminated because in the process of regenerating carbon by wet oxidation the accumulated biomass is destroyed. (Kreager-FIRL)

WASTE-TREATMENT PLANT POWERED BY ON-SITE ENERGY,
V. E. Smay.
Popular Science, Vol 209, No 3, p 97, 164, September, 1976. 1 fig.

Descriptors: *Treatment facilities, *Waste water treatment, *Solar radiation, *Methane, *Design criteria, *Energy conversion, Heat transfer, Construction, Concrete structures, Materials.

A waste treatment plant design for reducing off-site energy requirements is described. Except for a period from mid-December through February, solar energy and methane are expected to produce more than 90% of the heat required for the plant. A 1500-square-foot flat-plate, glass-covered hydronic solar collector will be the primary source of solar heat. This heat will go mainly to the anaerobic sludge digesters which operate most efficiently at 95 F. Excess solar heat will be used for space heating and domestic hot water. Methane which will be obtained from the sludge digesters as a byproduct will serve as a long-term storage medium for the solar energy. The plant will also recover 75% of the heat from the exhaust air in the vent system and all the heat from the electric (methane-fueled) generator. The building structure will be constructed of concrete blocks and bricks with insulation between. The roof is designed to retain snow for insulation value. Snow will also be used as a solar reflector. The project is due for completion by late 1977. (Kreager-FIRL)

DISINFECTION KINETICS OF ALGAL-BACTERIAL SYSTEMS,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
C. Venkobachar, I. C. Devkota, and D. S. Rana.
Indian Journal of Environmental Health, Vol 18, No 1, p 26-32, 1976. 3 fig, 2 tab, 10 ref.

Descriptors: *Disinfection, *Chlorine, *Oxidation lagoons, *Kinetics, *Coliforms, Bacteria, Algae, Organic compounds, *Waste water treatment, Laboratory investigations.

Laboratory investigations on the disinfection kinetics of algal-bacterial systems were conducted to investigate the feasibility of using oxidation pond effluents for the irrigation of edible crops. Residual chlorine curves indicated that chlorine consumption is a complex process in algal-bacterial systems and appears to be due to the oxidation of complex organic components, dead bacteria, and algal cells. Kinetic data indicated a deviation from Chick's Law, with the rate of disinfection being a function of the time of contact, disinfectant concentration, number of organisms exposed, and the temperature of the medium. The kinetics of chlorination did not follow a first order reaction. The maximum dose of chlorine employed (25 mg/liter) reduced the coliform count to 100/100 milliliters within 10-15 minutes. EVALUATING POLLUTION-PRONE STRATA BENEATH SEWAGE LAGOONS,
B. Leisch.
Public Works, Vol. 107, No. 8, p 70-71, August, 1976. 2 fig.

Descriptors: *Sewage lagoons, *Lagoons, *Stratigraphy, *Sewage treatment, Hydrogeology, *Geologic mapping, *Groundwater, Seismic studies, Resistivity, Analytical techniques, *Waste water treatment.

The use of electrical resistivity and seismic techniques for evaluating pollution-prone strata beneath lagoons is discussed. Refraction seismic studies can determine the physical characteristics and thickness of the underlying geologic formations. Earth resistivity measurements can then be used to develop greater detail in terms of porosity and permeability of consolidated or unconsolidated formations. An example illustrating the application of the above techniques for evaluating a sewage lagoon site is presented. An analysis of the data obtained from seismic and resistivity measurements indicated that voids in sandstone or underlying dolomite had developed initially through the action of descending groundwater along joints and fissures. The study also revealed the need for upgrading lagoon seal specifications. (Kreager-FIRL)

CADMIUM ACCRUAL IN COMBINED WASTE WATER TREATMENT-AQUACULTURE SYSTEM,
Environmental Management Inst. Marion, Mass.
W. B. Kerfoot, and S. A. Jacobs.
Environmental Science and Technology, Vol. 10, No. 7, p 662-667, July, 1976. 8 fig, 2 tab, 22 ref.

Descriptors: *Aquiculture, *Sewage treatment, *Tertiary treatment, *Cadmium, *Algae, *Shellfish, Heavy metals, Toxicity, Phytoplankton, Sea water, *Waste water treatment, Liquid wastes, Metals.

Trace amounts of cadmium were added to isolate links of a sewage/seawater-plankton-shellfish food chain employed in a prototype tertiary treatment aquaculture system. Accumulation of the metal was studied in two types of phytoplankton, a green platymonad (Prasinocladus tricornutum) and a mixture of diatoms (predominantly Phaeodactylum tricornutum and Chaetoceros simplex), as well as in two species of shellfish, the American oyster (Crassostrea virginica) and the hard clam (Mercenaria mercenaria). The algae showed a rapid increase in metal concentration until an equilibrium was reached proportional to the initial concentration introduced. Shellfish species exhibited a continual increase in concentration when exposed to sea water and algae mixtures contaminated with cadmium. Separation of the two pathways of transfer identified the algae as the principal source of accumulation in the aquaculture system. A rate of cadmium increase amounting to 0.003 micrograms/day was computed to be sufficient to yield a critical concentration of the metal for 3-year-old shellfish. (Kreager-FIRL)

DESTRUCTION OF ALKALINITY IN AEROBIC BIOLOGICAL WASTEWATER TREATMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg, Dept. of Civil Engineering.
J. H. Sherrard.
Journal Water Pollution Control Federation, Vol. 48, No. 7, p 1834-1839, July, 1976. 1 fig, 5 tab, ref.

Descriptors: *Nitrification, *Activated sludge, *Alkalinity, *Waste water treatment, *Mathematical models, Ammonia, Nitrogen, Nitrates, Nitrogen fixing bacteria, *Biological treatment, Biochemical oxygen demand, Phosphorus, Growth rates, Calcium carbonate, Chemical reactions, Aerobic treatment.

A mathematical model is used in conjunction with biochemical stoichiometric equations to describe alkalinity destruction which occurs in nitrifying activated sludge waste water treatment systems. The model results reveal that the commonly accepted value of 7.14 pounds of alkalinity as calcium carbonate destroyed/pound of ammonia nitrogen oxidized is in error. The error is primarily due to the incorporation of ammonia-nitrogen into the heterotrophic biomass. As a result, a small quantity of ammonia-nitrogen is available to be oxidized to nitrate-nitrogen. Primary factors affecting alkalinity destruction in nitrifying activated sludge systems are the influent waste water biochemical oxygen demand:nitrogen:phosphorus ratio and the net microorganism specific growth

An example problem is presented to illustrate mportance of these two factors in calculating inity destruction. (Kreager-FIRL)

ITRIFICATION OF WASTEWATER EF-ENTS WITH METHANE,
ois State Water Survey Urbana.
. Sollo, H. F. Mueller, and T. E. Larson.
nal Water Pollution Control Federation, Vol. No. 7, p 1840-1842, July, 1976.

riptors: *Denitrification, *Methane, *Waste r treatment, *Feasibility studies, *Kinetics, ogical treatment, Performance, Evaluation, nical reactions, Waste treatment, Bacteria, ates, Reduction(Chemical), Economics.

feasibility of using methane as a carbon ce for denitrifying waste water effluents was stigated. Columns packed with 0.32 to 1.27-imeter gravel were used as the reactors in of the experiments. The liquid level was tained at approximately one-half of the mn height, and methane was added to the r portion. The medium was recirculated nflow so that the liquid was able to dissolve ane from the atmosphere in the upper section re entering the lower flooded half of the mn. Identical systems with methanol as the cing agent were operated with nitrogen as the hase. Tests with parallel operations indicated the rate of nitrate reduction with methane as arbon source did not approach that observed methanol. With methane, the maximum rate ined was about 0.70 milligrams/hour/liter (as gen); whereas with methanol as the carbon ce, a rate of 4.6 milligrams/hour/liter (as gen) was obtained. Efforts to increase the rate trate reduction with methane using expanded mns failed, though such columns did increase itrate reduction rate when methanol was used e carbon source. In view of the low nitrate ction rate and problems involved in supplying lved methane to the denitrifying bacteria, trification with methane does not appear to be omical. (Kreager-FIRL)

THE EFFECT OF DIGESTED SLUDGE ON SOIL BIOLOGICAL ACTIVITY,
Wyzsza Szkola Rolnicza, Wroclaw (Poland).
M. W. Varanka, Z. M. Zablocki, and T. D. Hinesly.
Journal Water Pollution Control Federation, Vol. 48, No. 7, p 1728-1740, July, 1976. 3 tab, 71 ref.

Descriptors: *Sludge, *Soil amendments, *Soil analysis, *Microenvironment, *Enzymes, Kinetics, Municipal wastes, Microbiology, Bacteria, Fungi, Actinomycetes.
Identifiers: Soil biological activity.

The effect of continuous heavy applications of digested municipal sludge to cropland on the main systematic groups of soil microflora and enzymatic activity was studied using soil samples from control and sludge-amended Blount silt loam soil. Anaerobically digested sludge was appled each year for 6 years to the amended soil, resulting in accumulative loading rates of 0, 92, 184, and 369 metric tons/hectare. No clear-cut restrictions in microbial populations and their activities were observed with the sludge-amended soil samples. Although total bacteria, fungi, and actinomycetes populations were never less in maximum sludge-treated plots, a significant increase in the populations for each of the major groups as a result of sludge application was recorded only once during three sampling dates. Percentage of denitrifiers, protease, and amylase activities were increased as a result of sludge application; while invertase and urease activities were unaffected by sludge treatment. Only the percentage of Azotobacter and cellulase activity were decreased by sludge treatment. (Kreager-FIRL)

WASTEWATER IRRIGATION - THE PRICE IS RIGHT,
Santa Rosa Public Works, Calif.
B. J. Riha, and R. L. Mills.
American City and County, Vol. 91, No. 3, p 55-57, March, 1976.

Descriptors: *Water reuse, *Reclamation, *Irrigation, *Waste water treatment, *Reclaimed water, Municipal wastes, Farms, Treatment facilities, Projects, Construction, Regional development, Biochemical oxygen demand, Suspended solids, Dairy industry, Coliforms, *California, Cities.
Identifiers: Santa Rosa(Calif).

A waste water reclamation program being developed by the city of Santa Rosa, California is described. The city has embarked on a full-scale waste water irrigation program by taking the entire discharge from its 6.5 million gallon/day West College Avenue treatment plant and distributing it to local dairy ranchers for the irrigation of about 1000 acres of pasture grass and feed crops. The city has also started construction on a major expansion of its Laguna waste water treatment plant; and when completed in early 1978, an additional 10 million gallons/day of effluent will be diverted to the land. The Laguna plant will also serve as a regional treatment facility for the entire Santa Rosa Plain. The regional reclamation plan will effectively achieve zero discharge of waste water to neighboring streams during the dry summer months. Effluent quality at the West College Avenue plant is high, with biochemical oxygen demand and suspended solids removal averaging 85%. The most probable number of coliform organisms does not exceed 2.2/milliliter. The plant diverts its effluent during about 6 months of the year to four holding basins spaced along a 6-mile gravity aqueduct which is bordered on both sides by dairy and beef cattle ranches. Standpipes along the route permit ranchers to tap the storage ponds for sprinkler or flood irrigation. (Kreager-FIRL)
W77-00613

LET'S CONSIDER LAND TREATMENT, NOT LAND DISPOSAL,
Cold Regions Research and Engineering Lab., Hanover, N. H.
A. Ulga.
Civil Engineering-ASCE, Vol. 46, No. 3, p 60-62, March, 1976.

Descriptors: *Waste water treatment, *Infiltration, *Water reuse, *Percolation, *Potable water, Economics, Nitrogen, Viruses, Pathogenic bacteria, Coliforms, Waste water disposal, Design criteria.
Identifiers: Land application.

The use of land application for the treatment of waste water is discussed in terms of pretreatment requirements, disinfection requirements, application rates, hydraulic considerations, and economics. An engineered land treatment system can produce high quality potable water using simple pretreatment and limits the problem of disposing of sludges. Virus, pathogenic bacteria, and coliforms are completely removed by percolation through a 5-foot depth of soil under controlled slow infiltration design conditions. Survival times are typically a maximum of 2-3 months for organisms retained on soil particles. The application rate of waste water is limited by the nitrogen uptake potential of the vegetative cover; however, once this limitation is satisfied, as much water as possible should be applied to minimize costs, assuming no other limitations exist. The cost of land treatment is lower than that associated with the use of septic tanks for both rural and suburban areas. (Kreager-FIRL)

WATER HYACINTHS FOR UPGRADING SEWAGE LAGOONS TO MEET ADVANCED WASTEWATER TREATMENT STANDARDS: PART I.
National Space Technology Labs., Bay St. Louis, Miss.
B. C. Wolverton, and R. C. McDonald.
Available from the National Technical Information Service, Springfield, VA 22161, as N76-10697, $3.50 in paper copy, $3.00 in microfiche. Report NASA-TM-X-72729, October, 1975. 9 p, 2 tab, 12 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Biochemical oxygen demand, *Treatment facilities, *Water hyacinths, Sewage, Waste wate(Pollution), *Water quality standards.

Water hyacinths were studied as a means of accomplishing final filtration to remove nutrients, heavy metals, and other chemicals from domestic waste waters. Biweekly grab samples from before and after saturating a secondary domestic sewage lagoon were compared with samples from a control lagoon free of water hyacinths. The water hyacinth-covered lagoon had a surface area of 0.70 acre with a total capacity of 1.5 million gallons, receiving an inflow of 115,000 gallons per day from a 3.8 acre aerated primary sewage lagoon. Retention times varied between 14 and 21 days depending on the water hyacinth evapotranspiration rates. The water hyacinths functioned as an efficient and inexpensive final filtration system in a secondary domestic sewage lagoon during a three month test period. They reduced the suspended solids, biochemical oxygen demanding substances, and other chemical parameters to levels below the state standards. While absorbing organics, nutrients, and other chemical elements

from sewage waste, they produced large quantities of plant material. When grown in enriched sewage waste free of heavy metals, this biomass can be harvested and possibly processed into valuable feed products, organic fertilizer and soil conditioner, or methane gas and inorganic fertilizer. The volume of water hyacinths required depends on the amount of sewage to be processed and the desired purity of the final waste water. (Snyder-FIRL)

IMPROVED LIQUID-SOLIDS SEPARATION BY AN ALUMINUM COMPOUND IN ACTIVATED SLUDGE TREATMENT,
Nalco Chemical Co., Oak Brook, Ill.
C. F. Lenhart, and J. W. Cagle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 228, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-75-039, September, 1975. 71 p, 34 fig, 3 tab, 9 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Phosphorus, *Sludge digestion, Settling velocity, Chemicals, Sewage treatment, *Separation techniques.

A study was undertaken to determine the effects of sodium aluminate additions on the activated sludge waste treatment process. Data were compared for periods with and without chemical dosing. Waste water throughout the study was typical of the normal domestic sewage treated at the plant studied. The only attempts to adjust plant flow or treatment conditions were those necessary to maintain good, efficient waste water treatment operations. It was demonstrated that feeding liquid alkaline alumina to a 2.5 million gal per day activated sludge waste water treatment plant is a practical method of gaining several operational benefits. The increased sludge density permitted the plant to protect itself against solids washout during spot flows greater than 164% of designed plant capacity. Solids handling and ease of sludge volume index control were improved. Aluminate application allowed higher levels of mixed liquor suspended solids to be retained in the secondary clarifier. The improved solids removal with sodium aluminate reduced the loading on the tertiary treatment unit. Additional benefit was noted in the concentration of aerobically digested solids. Phosphorus removal approaching 80% was achieved with feed rates of 10 mg/liter as aluminum. The most efficient point to treat the mixed liquor stream was at the outlet of the primary basin. Residual benefits accrued for 10 days after aluminate feed was stopped. It took from 3 days to a week after starting the aluminate to produce optimum conditions in the secondary clarifier. Improved solids settling occurred within 24 hr of startup. Thicker return sludge resulting from the use of sodium aluminate permitted a substantial reduction in waste activated sludge volumes to be handled. (Snyder-FIRL)
W77-00622

DEMINERALIZATION OF WASTEWATER BY ELECTRODIALYSIS,
Environmental Protection Agency, San Francisco, Calif.
H. H. Takenaka, C. L. Chen, and R. P. Miele.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 102, $4.00 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-047, October, 1975. 35 p, 6 fig, 9 tab.

Descriptors: *Waste water treatment, *Chemical oxygen demand, *Electrodialysis, *Treatment facilities, *Sewage, Effluents, Membranes, Cost analysis, Waste water(Pollution), Activated sludge, *Demineralization.

An electrodialysis pilot plant study was carried out to investigate the use of the process for waste waterdemineralization. The study was conducted using a 12 gpm electrodialysis pilot plant and the carbon-treated secondary effluent of the Pomona activated sludge plant. Stack fouling due to slime occurred whenever an increase in stack pressure was accompanied by a decrease in stack electric current or demineralization. This organic fouling significantly decreased the effectiveness of the process. An enzyme detergent was successful in removing most of the slime on the membranes, however, heavy slime formation in the stack was not removed. If the chemical oxygen demand (COD) of the feedwater remained at 10 mg/liter or less, a weekly enzyme detergent flush maintained the total dissolved solids (TDS) removal in the design range of 30-35%. An acid solution was required after the enzyme detergent flush to remove the detergent and restore the stack amperage. Other forms of fouling, such as membrane scale, were not as serious a problem. An acid solution effectively removed scale formation. The cost to produce water with 30 to 35% TDS reduction in a 10 MGD single stage electrodialysis plant was estimated at about $0.194 per 1,000 gallons of product water, not including the costs of carbon adsorption pretreatment and brine disposal. DEMONSTRATION OF A PLANNING PERSPECTIVE FOR WASTE WATER SLUDGE DISPOSITION KNOXVILLE/KNOX COUNTY,
Environmental Protection Agency, Washington, D.C., Water Planning Div.
D. Neptune, M. Wyatt, and R. Heil.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 936, $7.50 in paper copy, $3.00 in microfiche. Report EPA-440-9-76-001A, November, 1975. 177 p, 22 fig, 30 tab, 41 ref, 4 append.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, Analytical techniques, *Treatment facilities, *Planning, Sludge disposal, Sludge, Waste disposal, Disposal, Management, Project planning, Cost analysis, Reclamation, Industrial wastes, *Tennessee.
Identifiers: *Knoxville(Tenn).

The existing and future sludge disposal problem in Knoxville, Tennessee was investigated. The techniques employed in the projection of the present and future sludge quantities and qualities; selection of feasible sludge handling, transportation, and ultimate disposal or resource recovery methods; and the evaluation of these methods compiled into management plans were derived from a methodology previously developed by the Environmental Protection Agency. Six sludge management plans were found feasible for further consideration. They are sanitary landfill of a digested, dewatered sludge; trench-incorporation of a digested, dewatered sludge; incineration of an undigested, dewatered sludge from most treatment plants and sanitary landfill of a digested, dewatered sludge from two outlying plants; land application by spray irrigation of a digested sludge from most plants and landfill of a digested, dewatered sludge from an outlying plant; land application by composting and disking of a digested, dewatered sludge from most plants and landfill of a digested, dewatered sludge from an outlying plant; and producing fertilizer from digested sludge. None appear to present insurmountable problems in terms of meeting environmental constraints, performance criteria, or institutional and legal feasibility. However, the spray irrigation plan appears less cost-effective than the other five. (Snyder-FIRL)

A PASSIVE FLOW MEASUREMENT SYSTE FOR STORM AND COMBINED SEWERS,
Grumann Aerospace Corp., Bethpage, N. Research Dept.
K. M. Foreman.
Report EPA-600/2-76-115, May, 1976. 137 p, fig, 1 tab, 6 ref.

Descriptors: *Sewerage, *Analytical techniqu *Flow measurement, *Acoustics, *Sewers, Flo meters, Design, Instrumentation, Electro equipment.
Identifiers: Experimental design, Acoustic sig tures, Sound level meters, Electroacoustic tra ducers.

A new, nonintrusive, low cost, passive flow m surement method to meet the urgent needs good management of storm and combined sew systems was investigated. The system is based sensing the near field sound emitted by disturbed flow at a channel discontinuity. Th local pressure pulses, called pseudosound, radi as dipole sound sources orthogonal to the fl direction. Flow rate is indicated by the outp signal of passive transducers, such as acceleron ters, attached to the outer wall of the chann after processing by a Fourier Analyzer. Labora ry tests using full scale sewer pipe elements an brief series of field tests measuring sanit sewage flow demonstrated its feasibility for ch nels where a discontinuity exists because of a c duit cross-sectional increase. The acoustic em sion has been found to produce unambiguo signals that increase in magnitude as the fluid fl rate increases. Low cost accelerometers havin wide range of voltage sensitivities, between 10 100 mv/g, were found to be well suited to acoustic monitoring function. Inexpensive but fective techniques to properly simulate sewer stallations were developed. The most relia unambiguous signal for flow rate measurement the acoustic emission component at a char teristic frequency, which is inversely proportio to the maximum geometric step at the discontin ty and directly proportional to the bulk sou speed of the fluid. Qualitative evaluation of t sound content from various and diverse rem sites can provide a mental image of local sew conditions that almost rivals in situ observati by a mobile crew, but with greater convenie and lower cost. Recommendations for further fi site testing using an instrumented sewer line made. (Snyder-FIRL)

WASTEWATER RECLAMATION PROJE ST. CROIX, U.S. VIRGIN ISLANDS,
Black, Crow and Eidsness, Inc. Gainesville, Fla
O. K. Buros.
Report EPA-600/2-76-134, June, 1976. 259 p, fig, 7 tab, 29 ref, append.

Descriptors: *Waste water treatment, *Biologi treatment, *Treatment facilities, *Waste tr ment, *Groundwater recharge, Reclamati Reclaimed water, Water reuse, Virgin.
Identifiers: Water reclamation, Waste water re mation, Artificial groundwater recharge.

A portion of the flow normally discharged to sea from St. Croix's primary treatment plant used for reclamation purposes. It was f processed in an advanced waste water treatm plant (AWWTP) by biological and physiochemi means. The treated waste water was conveyed a force main to recharge areas located about 1 mi away. Here it was stored in a holding tank

oduced into the groundwater aquifers by spray
gation and spreading basins. The project was
the purpose of improving the yield of wells and
sting in preventing further seawater intrusion
major well field. Background data on water
lity and quantity in the area was collected for 2
yr before recharging began. Recharging was
ied out for 8 mo. The best recharging method
ved to be with spreading basins in an alluvial
ey. The cost for treatment, recharging, and
overy was estimated at about $2.15/thousand
at 0.5 mgd, the rate used in the study. The pro-
demonstrated that it is possible to economi-
y augment the island's freshwater reserves
ugh using reclaimed waste water to artificially
harge groundwater. There was evidence of a
able increase in available groundwater in the
nity of the recharge activities. The major
blems included lack of sufficient waste water
treatment and recharge, mechanical failure of
tment equipment, and transfer to the central
tment plant of waste water containing a high
centage of sea water. Artificial groundwater
harge can only be accomplished successfully at
efully selected areas on St. Croix. The recharg-
activities did not significantly affect the water
lity of pumped wells. (Snyder-FIRL)

activated sludge process was studied in the
oratory to determine the technical feasibility
disrupting a portion of the microbial cells in
return sludge will enhance the operating effi-
cy and capacity of municipal activated sludge
nts. Activated sludge from a Bellaire, Texas,
t was acclimated to five different test com-
nds: 2,4-dichlorophenol, linear alkylate sul-
ates, nitrilotriacetic acid, ethylene
trilotetraacetic acid, and ethylene glycol. The
compounds were then incorporated into waste
er influent and fed to the acclimated sludge
ch had been mechanically disrupted, to varying
rees, by sonic energy. Significant amounts of
uble materials were released from the concen-
ed sludge in the form of total organic carbon. A
nificant portion of the microorganisms found in
centrated sludge are killed by sonication. The
strate removal activity of disrupted sonicated
dge is not significantly different from un-
upted sludge having a thousand times the cell
centration, and the cell free supernate from
upted sludge may have substrate removal ac-
y up to 10 times that of normal sludge. It may
possible to significantly increase throughput
acity by using a combination of normal return
dge and disrupted sludge of supernate. (Snyder-
L)

AVITY CLARIFIER,
. Jackson.

U.S. Patent No. 3,965,013, 6 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1727, June 22, 1976.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Water purification, Gravity, Flow characteristics, Sludge, Sludge treatment, Settling basins, Equipment.
Identifiers: *Gravity clarifiers.

The type of gravity clarifier described is one in which the liquid flow patterns are derived from the energy of the influent liquid mixture which flows tangentially into the circular tank. The sludge is moved in toward the center of the base of the tank. The upward velocity of the flow of liquid toward the outlet provides a decreasing velocity of flow to the point where the velocity is low enough so that suspended solid matter can be released and by force of gravity carried to the bottom. A radial flow over a weir to an outlet trough is provided for the effluent clarified liquid. The apparatus consists of a cylindrical tank having a closed bottom with a downward depending truncated conical shell attached at its large end to the upper portion of the tank wall, with a peripherial trough near the top end of the tank and a weir for the overflow of effluent liquid into the trough. The influent conduit enters the tank tangentially and flows the raw mixture into the tank in the space between the outside of the inverted conical shell and the tank wall. The sludge is removed from the tank bottom near the center of the tank. (Sinha-OEIS)
W77-00690

TREATING WASTE DISCHARGE LIQUIDS FROM METAL HARDENING BATHS, PARTICULARLY CONTAINING NITRITE AND NITRATE COMPOUNDS,
E. Mohr.
U.S. Patent No. 3,966,508, 4 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2216, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, Water pollution treatment, Water quality control, Evaporation, Condensation, Separation techniques, *Nitrates, *Nitrites.
Identifiers: *Nitrate-nitrite recovery, Cyanides, Hardening baths.

To improve recovery of nitrate-nitrite compounds from effluent of nitriding processes, a melt of the nitrate-nitrite salts is prepared and maintained at a temperature above about 400C. The effluent liquid is introduced into the melt, to evaporate the water and melt the salts contained in it. They merge immediately into the melt and the melt is drawn off by an overflow. The evaporated water is filtered to recover any remaining salts, together with condensation water. The apparatus includes a dispersion device close to the introduction duct of the effluent liquid to prevent introduction of the effluent liquid in a solid stream. This dispersion may be an open pot with a perforated bottom located beneath the surface of the melt, a cartridge with steel wool, or the like. The invention permits a continuous process without boiling over, or foaming. (Sinha-OEIS)

Sumitomo Chemical Co. Ltd., Osaka (Japan). (Assignee).
M. Ohkawa, and Y. Sawaguir.
U.S. Patent No. 3,966,594, 7 p, 5 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2243-2244, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Organic wastes, *Water pollution treatment, Chemical oxygen demand, Chemical reactions, Separation techniques, Aqueous solutions, Anions.
Identifiers: Amine compounds.

The invention provides a process for treatment of organic waste water containing water-soluble organic anionic substances. An acidic waste water is contacted with a water-insoluble organic solvent solution of at least one amine. It was found that dibenzylalkylamines can satisfactorily be applied even though it is a mixture of various kinds of waste water or has a fairly high COD value because it has the ability to separate an aqueous layer from an oily layer. Separation into an aqueous and oily layers occurs very rapidly, and the oily layer containing organic anionic substances is separated from the aqueous layer and then subjected to the subsequent alkali back-extraction using an aqueous alkali solution. The continuous treatment is carried out by means of a mixer-settler process or countercurrent process. (Sinha-OEIS)

PROCESS FOR THE TREATMENT OF WASTE WATER FROM A FIBERGLASS MANUFACTURING PROCESS,
Amchem Products, Inc., Ambler, Pa. (Assignee).
T. N. Crowley, and D. M. Urbanski.
U.S. Patent No. 3,966,600, 6 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2245, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Water pollution treatment, Water pollution control, Water quality control, Chemical reactions, Flocculation, Separation techniques, Water reuse, *Dissolved solids, *Chemical oxygen demand.
Identifiers: Fiberglass manufacturing.

The invention provides a process for the treatment of waste water from a fiberglass manufacturing process to reduce chemical oxygen demand and also reduce the content of both dissolved and suspended solids. It enables the water to be reused in the industrial processes, so forming a closed cycle which is both more efficient and more economical. The steps are: acidifying the waste water to a pH of from about 2.5 to about 5.5 by the addition of a non-toxic inorganic acid; neutralizing the acidified water to a pH of from about 7 to about 9 by the addition of an nontoxic inorganic base, the base being capable of forming, with the inorganic acid added in the first step, an insoluble inorganic salt; adding a flocculating agent to the neutralized water to promote the separation of solid material from the treated water; and separating the solid material from the treated water. METHOD AND APPARATUS,
Ecodyne Corp., Lenexa, Kans. (Assignee).
C. E. Burkhead.
U.S. Patent No. 3,966,599, 7 p, 2 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2245, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, *Water pollution treatment, Water purification, Aerobic treatment, Aerobic conditions, Equipment, *Aeration, Mixing, Biodegradation, *Microbial degradation.

Methods and apparatus are disclosed for treating biodegradable waste products. A liquor of waste products is introduced into a reactor mixing zone comprising a column of fixed media material having a high surface area to volume ratio, a low resistance to liquid flow and a surface condition receptive to aerobic microbial growth. The liquor is circulated in a continuous flow path including the fixed media column. A mechanical surface aerator is positioned in the continuous flow path immediately above the mixing zone to aerate the liquor and distribute it uniformly over the top of the fixed media column. The aeration, distribution and circulation of the liquor are accomplished in a manner to promote homogeneous mixing

throughout the mixing zone and to encourage aerobic microbial growth on the fixed media while minimizing agitation of a nature tending to dislodge the aerobic microbial growth and to develop flocculent aerobic microbes. A sediment receiving zone is provided immediately below an apertured floor of the mixing zone for collection of residual solids. (Sinha-OEIS)

EFFLUENT TREATMENT,
Robinson Brothers Ltd., West Bromwich (England). (Assignee).
A. Stevenson, and N. Harkness.
U. S. Patent No. 3,966,601, 5 p, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2246, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, *Water pollution treatment, Water pollution control, Water quality control, Chemical reactions, Separation techniques, Toxicity, Hydrogen ion concentration, *Chemical precipitation.
Identifiers: *Dithiocarbamates.

Dithiocarbamates are made on a considerable scale and widely used and thus they and related compounds tend to be present in some industrial effluents. They are used in making agricultural fungicides and in the rubber industry. It has been found that although dithiocarbamates are of low toxicity to mammals and birds, they are highly toxic to fish and have a significant and undesirable inhibiting action on the nitrification bacteria whose action is valuable in sewage treatment. Water-soluble dithiocarbamate is not biologically degraded in sewage treatment processes. A process is described for purifying industrial effluent containing dissolved dithiocarbamate by mixing the effluent at a pH of 6 to 8 with soluble heavy metal salt and thereby precipitating heavy metal dithiocarbamate. It is then separated from the effluent. It is essential that the pH of the effluent should be within the range mentioned and if not steps should be taken by addition of water-soluble basic or acidic compounds. (Sinha-OEIS)

LIQUID TREATMENT APPARATUS,
Ecodyne Corp., Lenexa, Kans. (Assignee).
D. G. Mason, and R. B. Higgins.
U.S. Patent No. 3,966,608, 6 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2249, June 29, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, *Domestic wastes, Septic tanks, Water quality control, Aeration, Anaerobic conditions, Microorganisms.

Because of the well known pollution problems that are generated by septic tank systems there is a need for a high-efficiency unit for the treatment of biodegradable wastes which is compact, inexpensive and can be used to provide treatment for single-family dwellings. This invention provides a method for treating such wastes. The liquor is delivered to a quiescent settling zone in which large particulates are permitted to settle to the bottom where they are subjected to digestion by anaerobic microorganisms. The liquor is then delivered to an aeration zone and then downward through a column of submerged fixed media. The fixed media is composed of a multiplicity of elements where are freely and randomly stacked on one another providing interstitial area between them. The elements have a high surface area to volume ratio, so that aerobic microorganisms can grow on their surface. As a result of their random stacking and high surface area, the elements promote homogeneous contact of the liquor with the fixed media. The liquor is received at the bottom of the fixed media and recirculated through the aeration zone and back through the fixed media in order to provide multiple passes through the media for thorough treatment. After such treatment the effluent ca be withdrawn from the unit. (Sinha-OEIS)

PACKED-BED REACTORS FOR NITRIFICATION AND DENITRIFICATION OF SECONDARY EFFLUENTS,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. C. Young.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 607, Price codes: A08 in paper copy, A01 in microfiche. Completion report ISWRRI - 72, Iowa State Water Resources Research Institute Ames, June, 1976. 144 p, 45 fig, 15 tab, 33 ref. OWRT A-052-IA(1). 14-13-0001-4015, 5015.

Descriptors: *Nitrification, *Denitrification, Nitrogen, *Tertiary treatment, Filtration, Effluents, Pilot plants, Biological treatment, *Waste water treatment, *Suspended solids, *Biochemical oxygen demand.
Identifiers: *Packed-bed reactors.

Upflow packed-bed reactors (PBR) have been investigated to determine their usefulness as a tertiary treatment process to further reduce biochemical oxygen demand (BOD) and suspended solids (SS) from secondary effluents and to remove nitrogen by biological nitrification and denitrification. Laboratory-scale units were used to help identify system design parameters and to study the effect of such variables as temperature, detention time, oxygen concentration and packing material. Pilot-scale studies using secondary effluent were performed to help identify operating problems and to determine PBR performance in a more realistic treatment situation. These tests have shown that the PBR process can remove about 50% of the carbonaceous BOD and suspended solids from a secondary effluent. Another 20% to 30% can be removed by granular-media filtration. Biological nitrification could be achieved at flow rates below about 0.5 gpm/ft2 (1.25 m/h) and denitrification could be achieved at flow rates less than about 1.0 gpm/ft2 (2.5 m/h). Granular media such as crushed sand or coal or modular plastic media provided about equal performance, but were subject to plugging especially when using the PBR for denitrification. A complete tertiary treatment system consisting of packed-bed reactors for BOD removal, nitrification and denitrification and granular-media filters for final polishing can provide an effluent with BOD, SS and nitrogen concentrations comparable to that which can be achieved by physical-chemical treatment including activated carbon adsorption for removal of organic materials.
